CONTENTS

- INTRODUCTION 1
- QUESTION 1 2
- QUESTION 2 3
- QUESTION 3 5
- QUESTION 4 7
- QUESTION 5 8

On the 13th November 2015, the National Infrastructure Commission published a Call for Evidence with respect to three core themes:

- 1. Connecting Northern Cities**
- 2. London's Transport Infrastructure**
- 3. Electricity Interconnection and storage**

This paper comprises the response of Arcadis UK to the second of those themes, **London's Transport Infrastructure.**

Introduction

Whilst we absolutely understand the desire of the Commission to seek responses that are grounded in evidence and data, the overall vision and strategy for London is exciting and will undoubtedly lead to a step change in infrastructure and therefore economic outcomes, there is a concern that existing approaches to investment appraisal will lead to sub optimal outcomes.

Therefore, we have taken an approach that seeks to provide some guidance to overcome some of these challenges by referring to our experience in other countries, and looked at the strategic question of how to value the benefits of the various competing investment interventions and how to prioritise them in what will inevitably be a constrained funding environment.

We look forward to discussing this submission with the Commission in due course and expanding on both the themes and Case Studies contained within it, and to providing any additional information and analysis from the rich library of other case studies developed by Arcadis.

Question 1 – What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London is home to 8.6 million people, is projected to grow to 10 million by 2030 and, assuming trend rates of economic growth continue, become a city of over 11 million by 2050. London competes on a global stage as one of the greatest cities on earth and if it (and the UK) is to continue to deliver, the benefits that flow from this status it needs to maintain its competitive advantage. Yet London is suffering from an acute shortage of affordable housing (200,000 additional units by 2030), education (600 new schools by 2050) and healthcare, and together with congestion and its aging infrastructure, means the city is becoming an increasingly less attractive place to live and work.

Attracting and retaining the talent required to maintain London's competitive advantage would depend on the ability to improve the quality of life for Londoners (and its hinterland). Managing the impact of climate change and changing the behaviours around public consumption of (what are now regarded as) basic human needs such as electricity, gas, water, and now data, are critical to the next generation and delivering a more sustainable environment.

This pace of change brings into question London's ability to fund this growth and ambition. Current funding models will not always be flexible enough to meet the demands of the city, and the ability for London and the surrounding hinterland to work together and be more flexible and agile; will be critical to its success. London's Infrastructure Plan alone calls for around £1.3trn of required investment through to 2050 to satisfy this demand.

London has extremes of wealth, with the very wealthy central London and the whole western corridor out to the Thames Valley self-evident. What is less obvious is that London also has some of the most deprived areas of poverty in the country. Rebalancing and redistributing some of London's wealth creation along its North/South axis and eastern corridor are real opportunities to address shortfalls in housing and employment to stimulate wider economic and social benefit.

Question 2 – What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2

The strategic options should be driven by the need to both rebalance London's economy as well as address London's wider growth agenda. This growth agenda is likely to result in the need for extra capacity on key corridors to alleviate congestion as well as improve journey times for all modes.

These strategic options should also be assessed using an appraisal framework that takes full account of the additional agglomeration benefits that would be derived from creating a faster, more frequent and more integrated London regional transport network. Whilst individual projects such as Crossrail 2 will undoubtedly have a significant impact, the wider network effects ought to be greater than the sum of the parts.

For example, traditional project appraisal would tend to look at the business cases for projects such as Crossrail 2, Bakerloo Line Extension and the Overground to Barking in isolation. However, couple this with the potential investment by Network Rail to upgrade the West Anglian line into Liverpool Street to four tracks, and then both put into the wider regeneration context of accelerating growth to the opportunity areas of Upper Lea Valley and North Bexley. The result is the creation of vibrant and dynamic wider economic zones forming a Northern corridor from London to the knowledge economy powerhouse of Cambridge, including the international transport hub of Stansted Airport.

A similar approach could be used to connect the South Coast upgrade into Victoria Station via Croydon create another linear economic zone including another international transit hub at Gatwick Airport. Indeed, whilst Arcadis understands the NIC has not asked for responses on Aviation capacity, we do feel justified in pointing out these additional benefits bought by the wider connectivity along a North/South axis for London and the surrounding hinterland. Additional runways can be built at all of Gatwick, Stansted and Birmingham (leveraging HS2 links) airports for the same level of investment as required by a single third runway at Heathrow, and would deliver similar economic gains.

Arcadis has used this approach to create models that maximise social and economic benefits for transportation links in other countries such as Asia and North America, and would be happy to share these with The Commission.

Of course, London and its hinterland is not a homogenous region. Whilst economic zones of considerable size could be created (such as The City, through the Lea Valley and then to Cambridge via Stansted), the needs of the citizens in this region will be very different to those in other parts of London and the South East. Given the fact that funding is always more constrained than would be ideal, choices have to be made and that means determining priorities. Sometimes those choices will have to be made taking account of qualitative as well as quantitative factors.

Arcadis has therefore developed a framework that enables policy makers to prioritise these strategic choices.

Prioritisation Framework

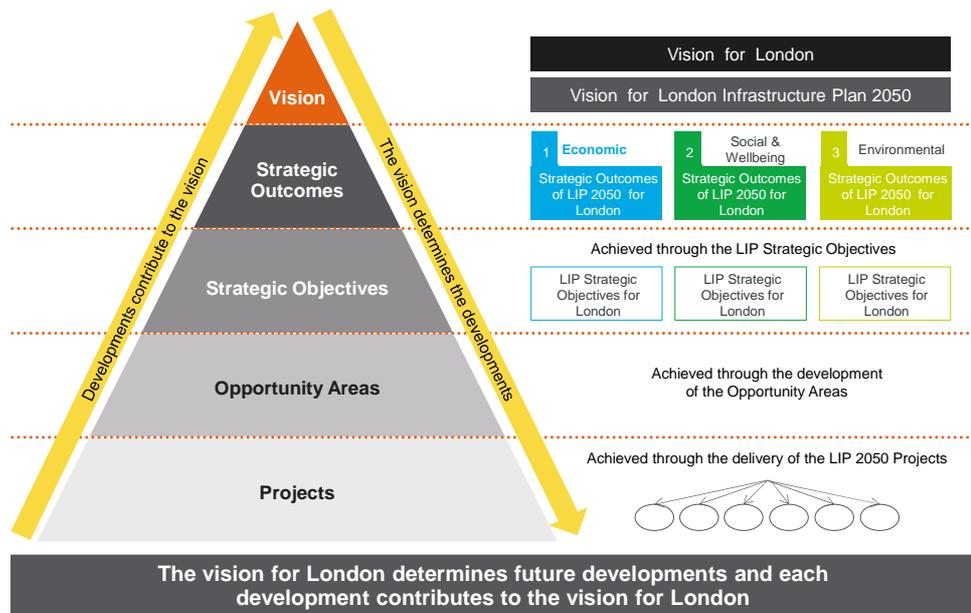

The establishment of a comprehensive appraisal framework that gives relevant weighting on a project-by-project basis and with appropriate local and regional context to:

- Direct User Benefits;
- Productivity Benefits;
- Investment and Employment Benefits;
- Changes in Land Use Planning.

will result in a more rounded approach to project appraisal.

A prioritisation framework is needed that takes account of factors that cannot always be easily quantified. Arcadis has experience of developing such a framework in London where the needs and agenda of the various Boroughs and Regions are often not aligned either economically or even politically, even though they all still see the benefit of functioning as a wider City Region. Below is an illustration of how the model works;

Prioritisation Framework Principles

A series of KPI's are developed for each of the strategic objectives that flow through to the Opportunity Areas to ensure the benefits are delivered over lifetime of the investment plan. These include employment, productivity and housing supply.

Question 3 – What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Having identified in Question 2 the benefits to be derived from a more integrated network that seeks to address both the needs to support the growth in London's wider economy as well as rebalance it, the question for Crossrail 2 is will the route currently being proposed support these objectives as much as it could do?

The criteria for assessing benefits needs to be broader than might traditionally have been the case. For example, is it correct that the benefit assessment for every station should be limited to a 1km radius from the station when the demographics for each are different? The private sector will always maximise their investment opportunity in a way the current appraisal model does not properly capture, particularly for densification and infill. Crossrail 2 will need to think and act more like a developer who runs rail networks, a good example of this approach being MTR in Hong Kong. London is a city with high land values with a growing population, and these land values could be sustained along the entire line of route with the right approach.

Arcadis have developed a model that assesses the wider social and economic benefits beyond the conventional scheme appraisal and this is set out in the case study below.

CASE STUDY – INTERNATIONAL RAIL PROJECT

Arcadis was commissioned by the Government of a major and rapidly developing country to undertake a socio-economic impact assessment study for a transformational investment in high-speed rail infrastructure. Having studied available literature and ex-post assessments of the economic benefits of High Speed Rail (the number and quality of such studies being still limited), Arcadis developed a new methodology to the ex-ante assessment of the economic benefits of High Speed Rail – the Socio Economic Development Plan.

The methodology assumes that rather than simply build the infrastructure and assume the private sector will respond to the availability of infrastructure by investing (which to an extent they will), a more accelerated and optimised approach to stimulating economic growth would come from a structured and proactive approach on the part of Government, whether national, regional or local. By assessing local physical, social and economic opportunities and aligning them to the broader economic and industrial strategy of the Government, we were able to identify for each of the principal economic centres on the line route, the industry clusters most likely to benefit from the introduction of a High Speed Railway and contribute the most to Agglomeration effects.

The opportunities identified through this process included:

- Physical Development – Integrated and Planned Land Use.
- Socio- Economic Development – Regeneration of key centres as well as improved mobility / development of talent.
- Business Opportunities – dramatic acceleration of the growth of emerging industry clusters (many in advanced and emerging technologies) through links to new customers and markets.
- Monetisation Opportunities – Land value increases generally as well as specific development opportunities at transportation hubs.

Overall, we determined that this approach could support a doubling of GDP compared to the current forecast for the same corridor over the next half century. Whilst the project was undertaken in a country with different socio—economic characteristics than the Northern Powerhouse region as well as being in a very different phase of economic and industrial maturity, the approach adopted in terms of planned interventions to maximise the Agglomeration benefits from major transport infrastructure has many similarities worth evaluating.

The influence of Crossrail 2 on regional networks should not be discounted either as 6-8 train paths per hour will be freed up into Liverpool Street and Victoria stations. Along the New Southgate branch a connection to Network Rail at Seven Sisters should be made.

In terms of cost reduction opportunities, in assessing whether the current route is in fact the right one, Arcadis believe you could omit King Road station (£600m saving) and with the Piccadilly Line upgrades being undertaken this calls into question the rationale for the New Southgate branch.

Question 4 – What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

The London Finance Commission has outlined its approach for funding London's infrastructure, largely based on keeping a greater share of the tax receipts generated by the city. Whilst this is a model that should be considered, Arcadis believe approaches are valid and possibly, in a hybrid form i.e. parts of different models used in tandem.

One of the challenges is to use models that are understood by lenders and investors and the risk profile can be managed. Some options for further consideration should be;

- For large one-off projects, the funding model used for Thames Tideway Tunnel and creating a separate Regulated Asset Base (RAB) has its place.
- London should utilize its asset base to create a balance Sheet approach. This would allow access to borrowing that is currently not available and is how the private sector would operate.
- Creating 'London Bonds' that finance a portfolio of projects and/or areas of regeneration.
- PPP – a model that has a poor reputation in the UK but commonplace in Europe and the United States.
- Community Infrastructure Levies (CIL's).
- Tax Increment Finance (TIF).

What the above illustrates is there are already a number of tried and tested models that should not limit London's ability to invest in its infrastructure. The finance is available. What is required are the conditions to invest i.e. stable policies.

Question 5 – How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied to London?

Arcadis has considerable experience of responding to similar challenges in cities in other countries. We have set out below one such case study in New York City that could be applied to London.

New York City will use the Lower Manhattan Resiliency Project (aka The Big U) to strengthen social and economic resiliency in climate-vulnerable communities, and to enhance the City's coastal defences in response to the evolving risks associated with climate change and other 21st century threats.

Lower Manhattan and its residents remain vulnerable to the impacts of climate change and sea level rise. The City's project, "**Protect and Connect**," will integrate physical and social resiliency into the diverse communities of Lower Manhattan through the implementation of physical projects, programmes, and policies. This will provide integrated flood protection to maintain the social and economic viability of neighbourhoods, and invest in resilient affordable housing by adapting building systems and neighbourhood infrastructure to protect homes from climate stressors. (see link

http://www.nycedc.com/sites/default/files/filemanager/Projects/Seaport_City/Southern_Manhattan_Coastal_Protection_Study_-_Evaluating_the_Feasibility_of_a_Multi-Purpose_Levee.pdf)

The funding vehicle was a Multi-Purpose Levee (MPL) which;

- Enhanced flood protection for Southern Manhattan.
- Resiliency programme funding source (i.e., the ability to self-finance and/or generate surplus revenue to fund other resiliency efforts); and
- Economic and community development (i.e., new economic activity, affordable housing, and open space; integration with Southern Manhattan's urban fabric and character).

The private sector developer revenues were projected from two sources;

1. The phased disposition of the rights to create new residential (market rate and affordable), office, retail, and hotel development on the MPL, in accordance with certain space absorption estimates; and
2. Ongoing property tax or equivalent payments in lieu of taxes ("PILOT") from new buildings on the MPL.

Revenues from development rights were estimated by modelling hypothetical vertical development cash flows for each of the uses described above and solving for the amount private developers would be willing to pay per square foot for the right to build each product type. These "residual" values per square foot were multiplied by the projected development programme for each development parcel to determine the revenue generation potential of each parcel in each of the different flood protection options under review. Payments for development rights were assumed to consist of a ground lease, structured as either a lump sum payment or a stream of future cash flows (the latter were calibrated to equal a lump sum payment in net present value terms).

The ground lease was assumed to generate a modest reduction in the value of development rights compared to land sale, which is consistent with observed conditions at other local sites subject to a ground lease such as Battery Park City.

This Feasibility Study's financial analysis relies on a number of assumptions relating to rents, operating expenses, property taxes, tax incentives, tenant improvements and leasing commissions for commercial uses, exit sales for income-generating uses, as well as sale prices for condominiums. These assumptions are based on historic data for Southern Manhattan's neighbourhoods, as well as reasonable projections of future conditions. Residential development on the MPL was assumed to be 20% affordable housing and 80% market rate housing.

In addition to the revenues generated through development rights, this Feasibility Study examined the revenues from property taxes or PILOT. The NYC Department of Finance provides detailed estimates of property taxes per square foot, by use and neighbourhood, in its "FY 2014 Guidelines for Properties Valued Based on the Income Approach, Including Office Buildings, Retail, Garages, Hotels, and Residential Properties." The Financial Feasibility analysis projects annual property tax revenues for each new development parcel on the MPL based on these estimates, which are weighted to reflect the breakout of each use on each such parcel.

Project costs can be financed with a range of different options. Depending on the magnitude of those costs, the availability of funds, and the preferences of decision makers, project costs could be financed:

- Directly through City, state and/or federal government capital budgets (and those of their component entities).
- With revenue bonds tied to on-site development proceeds and PILOT, with or without a public sector guarantee.
- By a private master developer in exchange for the right to develop on newly created parcels; or
- By a hybrid of these options.

Given the magnitude of potential MPL project costs and the range of potential new development on the different MPL typologies, a private master developer is unlikely to independently finance all project costs, even in exchange for the right to all project revenues. At the same time, given the constrained budgets of the City, state and federal governments, public capital grants would likely not be available to cover more than a portion of project costs.

The Feasibility Study assumes that a future MPL project would largely be funded with a combination of General Obligation bonds and revenue bonds. The latter requires public credit enhancement and/or debt service support, at least in the earliest phases of the project (i.e., before a critical mass of revenue-generating uses is completed). Therefore, to compare future costs and revenues, the financial feasibility analysis applies a discount rate associated with publicly supported infrastructure projects.

Project Financing Structures

The magnitude of project costs, as well as the potentially long gap between the beginning of MPL construction and the first deliveries of revenue-generating uses, suggests that a future MPL project may require some upfront public support to cover infrastructure costs. Depending on the option selected and a range of future decisions by policy makers, this public support requirement may vary. For example, a project with a higher affordable housing requirement or lower density would generate lower

revenues and could require a greater financial role for the public sector. This public sector role could include:

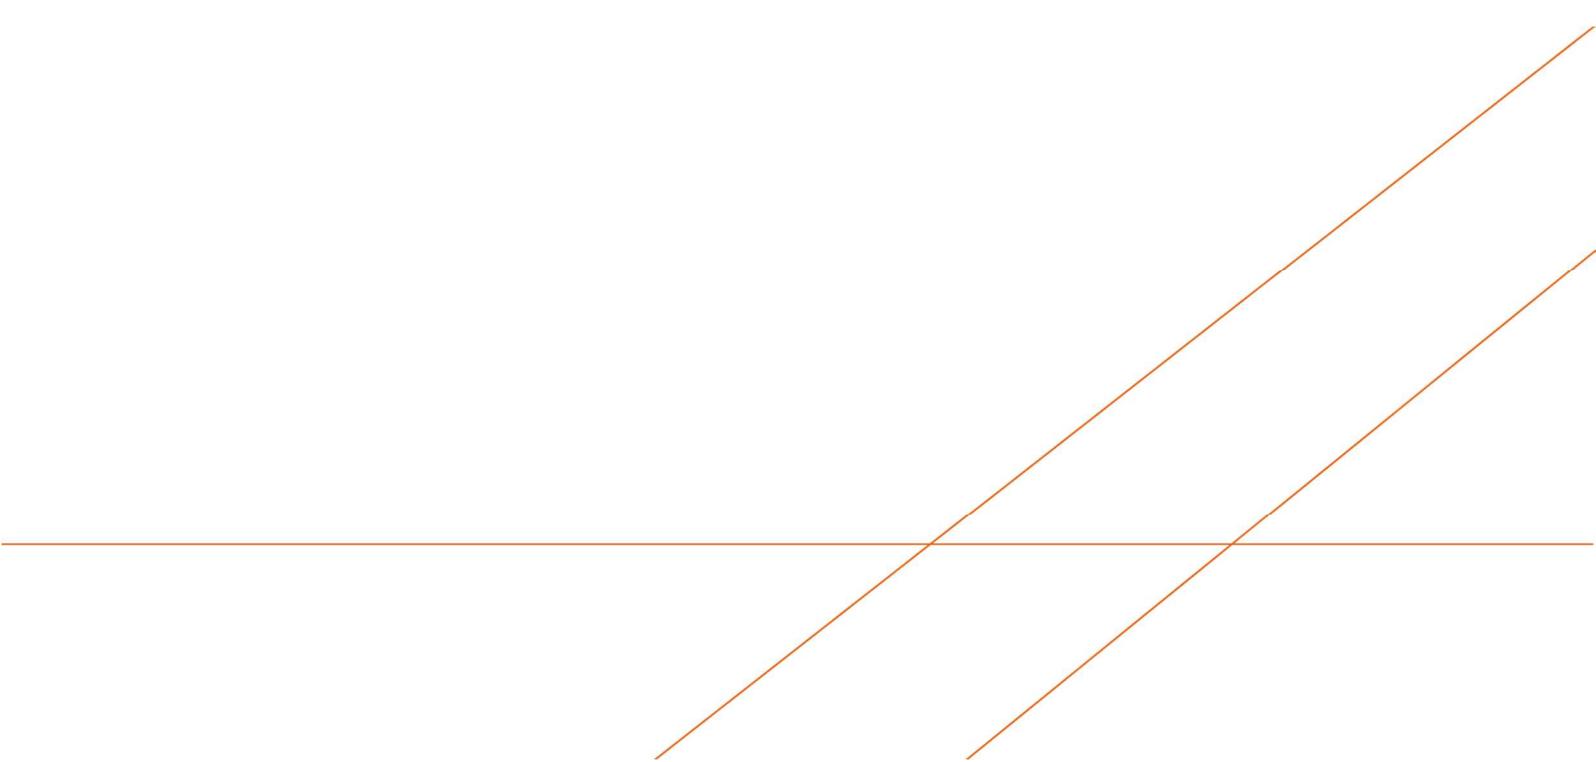

- Credit enhancement for initial bond issues, likely a requirement given the perception of risk during the early years of a new project.
- Debt service support prior to the completion of revenue-generating uses in order to minimize capitalized interest costs; and
- Capital grants from federal, state or City agencies to cover certain upfront costs as available.
- Project revenues, consisting largely of land sale or ground-lease payments and PILOT or property tax payments, would become substantial as the project is built out. Over time, these revenues could cover all required interest payments and pay down outstanding principal on infrastructure bonds. The time required to retire infrastructure bonds would depend on the degree of upfront public capital support and the degree to which capitalised interest can be avoided prior to the completion of revenue-generating uses.

The lesson for London is simply that there are proven funding models for the public and private sectors to work together, all it takes is political will.

Dear Sir/Madam

NIC Consultation – London’s Transport Infrastructure

For this topic area, we have not attempted to answer each question as set, however, we would hope it may be helpful to contribute some remarks that might inform the process and suggest a direction toward future lines of enquiry.

London’s Transport Infrastructure

London is a “world city”. It is a leading financial and commercial sector, hosting many of the world’s leading banks and corporations. It is a global hub for professional, legal, accounting, consultancy, and media related services. It is home to world-class research and development in numerous fields supported by a thriving academic network. And London is a global cultural centre, boasting world-class museums, galleries, theatres and night life.

In short, it is a thriving 24/7 metropolis that ranks among the most desirable locations to live and work in the world.

Much of that success is built on major infrastructure projects delivered successfully over the city’s history from Bazalgette’s sewers to the Jubilee Line Extension. Yet there is no room for complacency. As globalisation takes hold, there has never been a more pressing need to prepare for the future and ensure the Capital is fully equipped to compete in the new global marketplace, while providing for the domestic needs of its citizens.

With the capital’s population growing faster than homes, jobs and infrastructure can keep pace with, the case for strategic infrastructure investment is pronounced. London’s population is expected to increase from the current 8.6 million to more than 10 million by 2030 and reach a staggering 11.3 million by 2050. This prompts the obvious question ‘where will everyone live and work?’

Not only that, but London is also a major generator of wealth within the UK, so it is critical that London retains its pre-eminent role as an engine of growth for UK plc, as well as providing a roadmap for progress in other cities around the country.

London must remain competitive and it must remain an attractive place to live and work. Not just for the mobile global citizens contributing to the city's growth, but also for the many millions of Londoners who provide the critical lifeblood of the city. As such, London has to provide the hard and soft infrastructure needed to meet the needs of everyone.

To do so means supporting thriving commercial hubs alongside varied and affordable housing, as well as delivering accessible social infrastructure linked by seamless and effective, integrated transport systems.

Infrastructure investment in London can therefore no longer be a series of speculative thoughts about what could be delivered in the future. Rather it must deliver a comprehensive series of packages to drive growth and demonstrate to investors that London can and will stay ahead of the curve.

London's strong performance can support the infrastructure investment required in the North and elsewhere. However, the purse strings cannot simply sit within public sector coffers. A new system of funding and de-risking projects needs to be explored in partnership with the commercial sector. Options for new financial vehicles and delivery arrangements akin to some of the successful projects delivered in recent years across the USA and Asia should be carefully examined as part of the Commission's process to find appropriate and new financial solutions.

The transport element here provides a major challenge for London. Not only is much of London's existing transport network over 100 years old, it is operating at a capacity level way beyond that envisaged by the original design. As a result, London's road and rail networks require a high level of maintenance to operate at these levels.

Under-investment in this area would represent a clear brake on the city's prospects for development and growth. Equally a massive shortage of affordable housing, especially adjacent to good transport facilities, represents a potential curb on future development and the city's global status.

There are a number of potential schemes which address some of the issues and should certainly feature on the core list of priorities including the Upper and Lower Lee Valley, Barking Peninsula, Old Oak Common, Ebbsfleet and other areas of South London. Additionally, there is a need to investigate the multiple value outcomes of future infrastructure which includes flooding, landscape, development value, and transport with multiple outcomes which should be acknowledged earlier on in the cost benefit analysis of projects.

A particular project that Arup considers fundamental to the infrastructure investment plan in London is Crossrail 2. It needs to deliver an ambitious scheme which links the fortunes of highly productive parts of London, with other areas of latent potential. Yet, we also consider an approach should be taken where Crossrail 2 has a focus on orbital connectivity so that we do not see 'all roads leading to the CAZ and major employment areas', but instead to capitalise on the opportunity to develop successful growth nodes in outer parts of the capital.

Analysis points to the need to improve orbital connectivity around London and we think can be delivered incrementally with less burden on financial resources. The case is particularly strong when looking to areas with latent potential to deliver housing and employment clusters. Moreover, links to strategic growth corridors stretching out of

London to places like Cambridge, Gatwick and Brighton provide a growth story greater than the sum of its parts.

Looking to these examples, it is the ability to deliver jobs and homes which drives the choices for the route, rather than the route dictating the growth. In the instance of connecting Wimbledon to Croydon, a whole new corridor for connectivity could drive investment and jobs to supplement the growth of CAZ with new opportunities for complimentary growth corridors.

A link from Purley to Gatwick that takes in a link to Crossrail at Heathrow also provides for a series of employment and housing opportunities that will be lost with a radial route straight through the centre of London.

Our proposal is to consider a 'star and cluster' approach to London's growth which improves connections in these areas, with targeted regeneration investment alongside to transform the places which need it most, including Croydon, Barking and the Upper Lee Valley.

The challenge for the NIC will be to decide which projects are the easiest to fund; which offer the maximum potential for development; and which provide the greatest capacity and resilience gain for the network as a whole. It is undoubtedly a challenging prospect, but one that will be made easier with the advent of the NIC and a chance to develop a truly long-term view of how the UK should meet the needs of the Capital.

Arup stands ready to support the work of the NIC in the months and years ahead to make this initiative a success for the benefit of both London and the UK as a whole.

Yours faithfully

James Kenny
Head of Global Affairs, Arup

ACE Evidence: London's Transport Infrastructure

ACE response to the:

National Infrastructure Commission Call for Evidence

8 January 2016

About ACE

As the leading business association in the sector, ACE represents the interests of professional consultancy and engineering companies large and small in the UK. Many of our member companies have gained international recognition and acclaim and employ over 250,000 staff worldwide.

ACE members are at the heart of delivering, maintaining and upgrading our buildings, structures and infrastructure. They provide specialist services to a diverse range of sectors including water, transportation, housing and energy.

The ACE membership acts as the bridge between consultants, engineers and the wider construction sector who make an estimated contribution of £15bn to the nation's economy with the wider construction market contributing a further £90bn.

ACE's powerful representation and lobbying to government, major clients, the media and other key stakeholders, enables it to promote the critical contribution that engineers and consultants make to the nation's developing infrastructure.

Through our publications, market intelligence, events and networking, business guidance and personal contact, we provide a cohesive approach and direction for our members and the wider industry. In recognising the dynamics of our industry, we support and encourage our members in all aspects of their business, helping them to optimise performance and embrace opportunity.

Our fundamental purposes are to promote the worth of our industry and to give voice to our members. We do so with passion and vision, support and commitment, integrity and professionalism.

Q1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The story of London over the past twenty is one of success, a story that has seen the capital move from a declining, unattractive place, to one where people want to come and live and work, and in which companies wish to invest. The cities transport networks have, understandably, come under increased pressure due to this trend, and could be a significant hindrance to growth in the coming years.

In 2015, the capital's population reached 8.6 million people, surpassing the previous peak seen in 1939. The GLA's London Infrastructure Plan 2050 estimates that London's population is likely to rise by around 37 per cent to 11.3 million by the middle of this century. The higher end estimate suggests it could go as high as 13.4 million, however.¹ This growth equates to roughly two tube trains per week!

In addition, estimates suggest that there will be an additional 1.4 million jobs in London by 2050, an annual increase of 0.71 per cent, with two-thirds of these expected to be located in the inner-city boroughs. On top of this, there will be increases in visitor numbers, with the best estimates being that by 2022 around 21 million tourists will come, an increase of 40 per cent in the decade since 2012.²

In addition, and although outside the remit of the National Infrastructure Commission's terms of reference, an increase in visitor numbers will see added pressure on London's air connections. Further capacity will be required, as will the connections and ability to move passengers on the transport links to and from wherever this is provided.

All of this means there are obviously significant implications for demand, with Transport for London estimates suggesting that it will increase by up to 50 per cent, with traffic on the Underground and rail networks rising by 60 and 80 per cent, respectively.³

This will all occur in the context of increasing economic, financial, and fiscal devolution as central government continues to reduce the amount of subsidy from Whitehall to ensure the elimination of the UK's deficit. Future mayoral administrations must therefore ensure the capital must develop its own innovative funding mechanisms for the operation of Transport for London (TfL), with the aim of delivering a cost effective service for London's residents.

¹ *London Infrastructure Plan 2050 A Consultation* (2014), Greater London Authority, p. 7

² *Ibid*, p. 8

³ *Ibid*, p. 9

Q2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?
- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

The needs of London in terms of its transport infrastructure, fall into roughly three categories: capacity, connectivity, and capability. There are growing challenges around and increasing and an aging population, and all that entails in terms of economic and social activities. It is, therefore, vital that our transport networks have the ability to carry increasing and diversifying demand, that they connect with where people need them to, and that organisations and individuals have the resources and abilities to deliver and make use of them.

As stated already, by 2050 the capital will need 50 per cent more public transport capacity. Crossrail 2 is, therefore, a vital project that will provide much-needed capacity on a network that will soon have to cater for ten million residents, as well as numerous commuters from outside London.

Transport for London has a swathe of other initiatives, however, including the existing upgrade programme to the Underground network that will see 36 trains per hour on the Jubilee, Piccadilly, and Northern lines by the mid-2030s. This will increase peak capacity on these lines by between 20-50 per cent.

There are also plans to extend the Bakerloo line south from Elephant and Castle to Lewisham and beyond, transforming connectivity in South London. The modernisation of key central London stations including Holborn, Euston, Victoria, and Waterloo, that will also be a catalyst for the growth and development of the surrounding areas, is also proposed.

On the rail network, the long term aim of the Mayor's Office and Transport for London is to gain further control of the commuter routes in and out of the capital. This has the potential to transform the rail network inside London's boundaries into the equivalent of a second tube network, in terms of capacity.

Through closer collaboration with Network Rail to provide more trains and carriages per hour, the authorities in London feel it is possible to carry twice as many passengers than at present, reducing crowding.

As for London's roads, in terms of strategic interventions, again Transport for London has significant plans in this area, with up to three new river crossings proposed for the capital east of Tower Bridge and a new inner orbital tolled road tunnel that could see congestion reduced by 20 per cent in central London.

ACE's members feel that the best way motorists can be supported is to provide them with a reliable asset, i.e. the road, with as little disruption as possible and as cost-effectively as possible. They feel this can best be achieved by closer collaboration with all the parties involved in this process, from Highways England, TfL, the GLA, and the boroughs.

This collaboration will have the same benefits as those outlined above. More innovative solutions will be delivered with less disruptive last-minute changes that add cost and time onto a project. Motorists will therefore be able to enjoy a better quality road and journey, traffic will flow more smoothly, and the business of the capital will be conducted more efficiently.

Continued support should also be provided for efforts to promote cycling in London, with the provision of improved infrastructure, particularly along the capital's roads and in the form of the Cycle Superhighway network. For example, 'rest areas' along the routes could be introduced with covered areas, access to tools, and volunteers from the London Cycle Campaign during weekends. This could help people adjust their bikes and provide support for those cycling with children.

Much of the work to develop these options is already being carried out by Transport for London, along with the correct staging and prioritisation of the projects across all modes of transport. ACE would encourage any recommendations from the National Infrastructure Commission to take this into account and to ensure that the construction sector's desire for certainty through a visible and stable pipeline is met as far as possible.

Q3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Crossrail 2 on its own has a cost-benefit ratio that will see around £1.80 generated for every £1 invested in the project, according to research by consulting firm PWC. This increases to a range between £2 and £2.60 when wider economic benefits are taken into consideration according to the same research and from data provided by AECOM, the global engineering firm. 4 London First in their report, Funding Crossrail 2, estimate that it could be even higher, at £4.10⁵

⁴ *Crossrail 2 Funding and Financing Study* (2014), PWC, p. 11

⁵ *Funding Crossrail 2* (2014), London First, p. 6

There exists significant opportunities, therefore, to dramatically increase the already significant benefits to London and the whole UK when constructing and operating Crossrail 2. Much of this will involve factors beyond the scope of a purely transport-focussed project and hence will need input from a multitude of stakeholders and interested parties, and require broader consideration than other projects.

There will be a massive opportunity for significant regeneration all along the route of Crossrail 2, from the area around Shepperton and Chessington in the South to Cheshunt and the upper Lea Valley in the North. This could represent a substantial number of jobs, housing, and prosperity in areas where it could do a lot of good.

In addition, this is an excellent opportunity to line up major infrastructure projects in order to get the most out of supply chain efficiencies, skills developments, and therefore save on costs. London is embarking on a number of projects that require, for instance tunnelling skills and if schemes are planned properly it will be possible for these trained experts to transfer from one project to another seamlessly.

This will have the benefit in the first instance of training up a large number of skilled experts, benefitting them and the wider economy. It will also enable the UK to position itself as a global expert in tunnelling as our engineers are trained up and gain first-hand experience of what it is like to engage in this kind of work. Finally, there will then be little need to scour the world for expertise, driving up costs, and relying on externalities not influencing the labour market.

This is just one example as well, there are multiple disciplines that will be needed to undertake a project such as this and that present an excellent opportunity in training and developing an expert workforce.

Finally, committing early, planning thoroughly, and lining the project up so that it fits seamlessly into a programme of other large-scale infrastructure projects will ensure that all companies involved in the process can themselves plan effectively, allocate resources efficiently, and enable the project to be delivered on time and on budget. Certainty is the key to delivering a project like Crossrail 2.

Q4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?
- What innovative funding mechanisms could be considered to support delivery of key schemes?

ACE supports a mixed approach to the funding and financing of London's transport infrastructure improvements, especially when it comes to Crossrail 2.

Specifically on Crossrail 2, ACE feels that much good work has been done by the London First Crossrail 2 working group, which published a report looking into this particular issue, and would encourage the National Infrastructure Commission to give strong consideration to its recommendations.⁶

Based on 2012 prices this would involve a grant from central government of around £4 billion, while Network Rail would contribute £2 billion to a final cost of around £16 billion, subject to an exact contingency figure that Treasury insists on incorporating into the total. These figures, however, would be more than recouped by government and the UK's rail infrastructure owner through increased tax revenues and reduced congestion on the existing network.

Contributions totalling just over £6 billion from the existing Transport for London farebox and borrowing based on Crossrail 2's potential farebox should also form a significant part of any funding of the project. Contributions from developers, as well as the potential for intensified development of land in and around stations could also bring in around £3.5 billion, along with another £2.5 billion in the form of council tax and business rate contributions.

A significant source of funding, however, could come from a greater amount of fiscal devolution. At present a mere seven per cent of all the tax paid by London residents is retained by the Mayor of London and the boroughs, while the equivalent figure for New York is around half.

Devolving control of property taxes, as well as lifting borrowing ceilings, in conjunction with a parallel reduction in the grant from central government would see funding of around £5 billion made available for the Mayor of London. This could then be put to use on Crossrail 2, or indeed, other infrastructure projects in due course.

This last point is an essential one too, for funding future projects beyond Crossrail 2. This fits into the government's agenda around devolution, and would be consistent with measures implemented in other areas of the country such as Cambridge and Manchester. In addition, it could also help to meet the target of eliminating the deficit and paying down the national debt.

This kind of mixed approach should be one that becomes the standard for delivering large scale, long term infrastructure in London. The exact nature of the make-up of each element should be within the remit of Transport for London, however, with the options of

⁶ London First, *ibid.*

borrowing money, requesting funds from central government, eliciting contributions from developers and business partners, all contributing.

Ultimately, this will contribute to the certainty that the construction sector requires through the ability of Transport for London to plan into the longer term and fund projects itself without as much recourse to central government. In turn, Whitehall will benefit from increases in tax revenue and improved efficiencies in the capital.

Q5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

In ACE's view, there are three case studies of major metropolitan areas in other countries that have shown innovative responses to similar challenges and priorities that London is itself facing. These are Paris in respect of long-term certainty, Hong Kong in respect of innovative funding solutions, and New York in respect of devolution of powers.

We have that in Paris, the authorities there have developed an ambitious, innovative, and fully funded plan for almost every aspect of their transport network up to 2030. Known as 'Le Nouveau Grand Paris', this has allowed all those involved to plan thoroughly, align projects to enable the efficient allocation of resources, and ensure budgets and timetables were realistic and achievable.⁷

In Hong Kong, public transport is operated by the Mass Transit Railway (MTR) Corporation, one which posted a \$2 billion profit in 2012. It did this through 'value capture', taking advantage of the uplift in values and profits through the increased passenger traffic that is provided by their services. This can then go to subsidising further expansions and upgrades, all while keeping fares low.

Finally, as stated above, we have seen New York enjoy high levels of fiscal devolution, with around 50 per cent of all tax revenues raised in the city remaining there. A similar approach in London, with more of its funds being placed at the disposal of the Mayor, would enable greater decision-making ability and allow for increased certainty through improved planning.

National Infrastructure Commission: Call for evidence

APM background

The Association for Project Management (APM) is a registered charity with over 21,000 individual and 550 corporate members making it the largest professional body its kind in Europe. APM is committed to developing and promoting project and programme management through a wide range of activities including membership, qualifications, events and enhancing standards and knowledge in the profession.

About APM's call for evidence and background of respondents

APM held an online survey which was open to members and the wider project management community. Responses came from a wide variety of business sectors such as transport and logistics, consultancy and construction as well as a broad spectrum of roles including project managers, academics and company directors. The timing of the call for evidence reduced the opportunity for the fullest consultation, so this document presents an informal synthesis of responses received, rather than a formal statement of APM policy.

NIC Call for evidence

I Connecting northern cities

1) To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?

Respondents felt that weaknesses in transport connectivity are currently playing a major role in holding back the development of enterprise creation and growth in northern cities. Job creation was also an area of concern in terms of connectivity with respondents noting that connectivity played some extent in regards to this issue. Housing was not a great issue amongst respondents, with most believing that connectivity had little or no impact on the northern housing market.

2) What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? All transport modes are open for consideration.

Some respondents noted that road users could be reduced by expanding the Manchester Metrolink into Cheshire which would primarily serve to support the Cheshire hinterland around Manchester. It was felt that Manchester Airport railway station has a useful range of services but the lack of parking, very limited pick up and no bike facilities, means it is impractical for many would be travellers particularly locals who have not flown into Manchester Airport. A railway link from Manchester Airport south connecting into the Manchester- Chester line, would considerably improve the access to the Airport from Chester and surroundings. Modern electrified rail services with fast and reliable commuter services are desperately needed throughout the north of England, both between and within cities. Rail connection to airports such as Leeds and Manchester are essential. Rail networks should also consider more reliable goods transport to take heavy goods vehicles off the road thus rail development should be prioritised over building new and enhancing existing roads.

All respondents felt that, although road transport will continue to be highly important, is important to note that it is only one form of communication and is currently close to maximum capacity. Respondents noted that by including on-line and virtual communication methods when considering infrastructure investments, it would be easier to identify the essential from the nice-to-have. It was felt that a policy of nationally driven localisation would create the capability for regions to identify and resolve their own transport needs which would speed up action and create a greater focus on sustainable regional needs.

In terms of funding, respondents believed that the current regulated privatised system in key transport modes exposes the taxpayer to all of the downside risk and the private sector to all of the upside risk. They considered whether it would be possible to run a multimodal tender where private and public sector bid on the same basis. It was felt that running a tender like this, with all costs truly pushed up front, allows for the different bodies real risk appetite to be shown, ensuring that a true cost can be identified and assessed appropriately.

3) Which city-to-city corridor(s) should be the priority for early phases of investment?

Respondents considered a number of potential corridors which they felt should be considered as priorities for early phases of investment. These included:

- The expansion of the Metrolink into Cheshire
- Hull and Grimsby (docks) to Leeds
- Leeds to Birmingham
- Leeds to Newcastle
- Manchester to Birmingham
- Manchester to Liverpool

4) What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?

It was suggested that a strategy of regional empowerment could involve some type of pan-northern political body to make the decisions. This could potentially be headed by Ministers and include northern MP's and Councils with oversight from central government to ensure that national interests were not compromised when achieving only local gains. The advantage of such an approach would be centralised information and idea sharing which might stimulate growth with sustainable solutions conceived by the areas impacted by change. It was also felt that local employers should have a voice and thus involved in the funding solution.

Funding could be from a combination of central and regional potentially supported by fairer distribution of existing subsidies, possibly away from London, and by reducing road infrastructure development in favour of rail and by private contributions from rail operators as well as government capital and borrowing.

5) What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?

Respondents believed that both Leeds-Bradford and Manchester airports had the potential for expansion but require enhanced rail links and more long distance flights in order to reduce the need to travel to airports in the south east. All respondents noted that northern ports have an important role to play in terms of international connectivity over the next 20. Sunderland, Grimsby/Immingham and Hull were cited as potential models which would serve to support UK import and exports and hopefully help support a northern powerhouse built around engineering and advanced manufacturing. Success at these ports may also open the way for Newcastle or Middlesbrough ports to be further developed to respond to changes in demand and volume.

2 London's transport infrastructure

1) What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Nearly all respondents believed that the UK is overly reliant upon London and the South East which has led to over-crowding, inflated property prices and increasing pressure upon its infrastructure and services.

Many also felt that this 'London centrality' fuelled unnecessary travelling into London whilst creating a lack of investment in the northern cities and elsewhere. Most respondents felt that incentives are needed to encourage people to move to other parts of the country to utilise the available resources and capacity in other UK settlements.

2) What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Respondents only offered limited guidance in answering this question but many felt that large scale infrastructure developments could be diverted from London to northern cities.

3 Electricity interconnection and storage

1) What changes may need to be made to the electricity market to ensure that supply and demand are balanced, whilst minimising cost to consumers, over the long-term?

Many respondents noted that in the short term, local generation through wind and solar energy should be encouraged and supported, with some local storage and less reliance on the national grid. Demand management can only be assisted by improving housing stock and price incentives. Participants noted that the UK faces a major power supply shortage with poor resilience, lack of generating capacity and poor distribution. Most of the market questions cannot be addressed adequately until secure supply is achieved.

2) What are the barriers to the deployment of energy storage capacity?

Much household demand could be for low voltage, such as can be generated by solar energy and stored in batteries. Respondents suggested that new housing might have a low voltage distribution network for lighting and electronic items. For higher voltage storage, options were limited.

3) What level of electricity interconnection is likely to be in the best interests of consumers?

Respondents believed that one of the main issues is the fragmentation of the market which makes it impossible to coordinate interconnection. Participants considered that a larger grid may not be required if there were more localised generation and storage.

National Infrastructure Commission call for evidence – London’s transport
infrastructure
IPSE response

January 2016

ADVISING
EMPOWERING
INSPIRING
SUPPORTING
ENABLING
INDEPENDENT
PROFESSIONALS

About IPSE:

- The Association of Independent Professionals and the Self Employed (IPSE) represents the estimated 4.5 million individuals working for themselves in the UK.
- Over 97% of our 20,000 members work through their own limited companies
- IPSE also represents 48,000 self-employed construction workers through our relationship with leading construction contract and payroll providers Hudson Contract
- Research has shown that independent professionals allow businesses to promote innovation, maximise performance across peaks and troughs in demand, and create jobs by increasing the level of innovation and efficiency in the economy.

London's transport infrastructure

- 1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?**

Housing

With London's population expected to hit ten million by 2030, the development and provision of appropriate housing is clearly going to be a major challenge in the coming years. Welcome steps are being taken to address this, for example with the £103 million funding package announced by the Mayor of London in 2012 to support the development of 2,700 homes. Similarly, IPSE was pleased to hear the announcement from the City of London that it planned to build 3,700 new homes by 2025 on housing estates and other land it owns outside the Square Mile.

To ensure these projects are fit for the way people will work in the next two to three decades, IPSE believes government should ensure that new housing developments are equipped with fibreoptic broadband as standard. This will be particularly beneficial to the growing numbers of self-employed individuals in the labour market who are looking to strike out on their own and grow a business.

There are already 4.5 million individuals working for themselves, delivering flexible expertise to a wide range of businesses while enjoying the autonomy this way of working offers. As the [2013 paper](#) by Professor Andrew Burke illustrated, independent professionals allow businesses to promote innovation, maximise performance across peaks and troughs in demand, and create jobs by increasing the level of innovation and efficiency in the economy.

This focus on housing will provide a big boost for the UK's construction sector, where 2.1 million individuals work contributing £103bn, or 6.5% of total economic output, to the UK economy.

Flexible workspace

As the labour market continues to shift, with individuals choosing the greater autonomy that comes with self-employment, government will need to pay greater attention to where people work. Those working independently are increasingly opting to work in collaborative workspaces known as "workhubs" – there are an estimated 40 in London today.

Workhubs typically consist of hot desks, meeting rooms and high speed broadband. They also offer services such as IT and business support and other training programmes. This collaborative way of working provides a motivating environment, as well as helping to build a community of like-minded individuals. As research from the Brighton Fuse project has shown, this environment allows freelancers to more easily share ideas, innovate

and ultimately grow their business. It is however difficult, and often financially prohibitive to open and run premises.

Indeed one third of 18-39 year olds identify cost as a major reason why they do not use workhubs. Freelancers unfortunately do not benefit from the tax system in the same way most small businesses do. This is because small businesses with premises are exempt from paying business rates, yet those using workhubs are effectively forced to pay them indirectly. This is because they are typically a significant part of the operating cost of many workhubs, which are often run by collectives of self-employed workers.

As this way of working becomes even more common, the planning system may prevent the speedy rollout of workhubs. Identifying a site is one thing, but getting planning permission can be difficult. Reclassifying retail properties as office space has proven difficult for a number of workhub developers.

To support this way of working, IPSE believes action is needed in four key areas:

- Cut business rates for workhubs – small businesses with a rentable value up to £10,000 are eligible for 100% business rate relief – extending this to workhubs would ensure independent professionals are also effectively incentivised to develop and grow their business
- Incentivise the use of empty properties as workhubs – councils could easily address this blight by publishing interactive maps of disused buildings in the area. This would include the dimensions of the property, its rateable value for business rates and its previous use.
- Extend Permitted Development rights to allow empty premises to change their use – government should explore allowing empty retail premises (A1, A2, A3 & A4) over 500m² to be reclassified as B1 office space under permitted development rights.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Transport connectivity is vitally important for the self-employed. IPSE survey data from 2015 found that independent professionals travel on average 1,775 miles each month to their place of work, while spending £8,056 each year on transport costs.

Investing in all forms of transport infrastructure is therefore vitally important in allowing freelancers the freedom to travel quickly, delivering flexible expertise to businesses of all sizes. When travelling by rail, policymakers can also go further in helping freelancers work on the move. Ensuring rail franchising agreements include a commitment to enabling WiFi across their networks will provide a productivity boost to the large number of freelancers who regularly travel into or from London.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

As with all large infrastructure projects, greater effort needs to be made to open up the procurement process to smaller businesses and collaborations of independent professionals. Often it is only the very largest businesses who can compete here, given the onerous compliance requirements and very complex contracts.

But this does not always lead to satisfactory outcomes. The cost and complexity of large contracts can lead to delays and ultimately hit the public purse. For example, it was widely reported in 2015 that taxpayers could be hit with a bill for up to £700m after the government reportedly lost a legal battle with Fujitsu over a failed NHS

IT system. The Fujitsu Connecting for Health contract was part of the £12bn NHS national programme for IT, large parts of which have had to be abandoned at a cost estimated by the National Audit Office to be £2.7bn.

As important infrastructure projects are delivered in London over the next twenty years, government clearly needs to move away from its dependence on larger suppliers to deliver projects, instead effectively using the unique flexible expertise that independent professionals offer and the value they deliver for complex projects.

In delivering large infrastructure problems in London, government should build on its ambition that 1 in every £3 of government spend will be with SME. It should go further in breaking up contracts, committing to a sub-target that a quarter of spend within the SME ambition will be with microbusinesses including collaborations of independent professionals.

In addition, government should commit to publishing tender documents in an open source, editable format. This would allow microbusinesses to suggest revisions and flag up aspects of the contract which present difficulties.

It is of course inevitable that some large London infrastructure contracts will be awarded to larger businesses, but this doesn't mean independent professionals have no role to play. A Cabinet Office study has found that the fifty largest suppliers to government are responsible for 35% of government spending, and there must be a role to play for our smallest businesses further down the supply chain.

IPSE believes a greater onus must be placed on these large "tier 1" contractors to demonstrate how they will open up opportunities for subcontracting to the widest possible group. Tier 1 contractors should be expected to publish details of who they contract with in order to promote accountability.

London's transport infrastructure

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London faces a number of key challenges over the coming decades. The City continues to grow at a rate not seen for many years (the fastest rate in 80 years) and our work has shown that the existing London Plan and the Mayor's London Infrastructure Plan (2050) are underestimating the level of population growth and employment growth that the city can expect over the next 25 years. This has significant implications for London in relation to how the population can be accommodated, how people will travel to work, access to job opportunities, the city's environment and quality of life. The hard and soft infrastructure that will be required to support this growth will need to be planned to deliver these greater levels of growth, but will also need to be adaptable to future changes in the economy, environment and society.

The recently published Atkins report Future Proofing London (which can be downloaded from our [website](#)) identifies four key interlinked risks that London faces which include:

- Housing - A failure to meet the city's housing needs
- Economy – the economy becomes less diverse
- Society – society becomes more unequal, and increased social tensions impact on London's stability
- Environment – the city's continued growth degrades the environment further impacting on quality of life

The following provides further detail on each of these key economic and social challenges and provides a reference to the appropriate section in the Future Proofing London report where further illustration and detail on these points can be found.

Population and employment growth greater than expect and planned for

As part of our work on Future Proofing London we worked with Oxford Economics to look at future population and employment scenarios for London. Oxford Economics forecast London's population to reach 12 million by 2050 compared to the London Infrastructure Plan (2050) that projects the population to reach 11.3 million by 2050. This is a difference equal to the current size of Manchester.

The London Infrastructure Plan forecasts jobs to reach 6.3 million by 2050, this is a level that Oxford Economics forecasts will be surpassed by 2026.

If these projections that underpin London's strategic and infrastructure planning are underestimating the level of growth that is likely in London, then the city will be failing to plan properly for its growth, and the risks we have identified will be exacerbated.

(for further detail on the population and jobs growth see section 3 pages 38-40 of Future Proofing London).

Housing

Housing is a vital piece of the city's infrastructure, without sufficient housing London cannot continue to accommodate population growth and house those that work in the city. Housing demand continues to grow as the population increases and with population estimates identified above this demand is not set to ease any time soon.

Supply is failing to keep pace with demand, current rates of housing delivery (26,000 pa) are well below London Plan housing targets of 42,000 pa, and the London Plan target itself is likely to be below what is actually required (with many suggesting 50,000 homes per annum are required).

The increasing demand for housing and the chronic undersupply of housing are combining to make housing affordability a serious issue for London. On top of this, wages have not increased at anywhere near the same rate as house prices, this is not just an issue for those on low incomes but also for those on medium incomes.

These housing issues are pushing people out of both central London and London entirely to find a place to live. Some of those moving out of London are retaining their jobs in London resulting in ever greater commuting distances.

(for further detail on housing challenges facing London see section 4 pages 45-50 of Future Proofing London).

Economy

Jobs growth over the past 15 years has been focused on the Central Activities Zone (CAZ) with less growth in outer London. With job densities much greater in inner London, many outer London residents are reliant on commuting to jobs in central London. The trend in greater job growth in inner London compared to outer London is expected to continue and as a result there will be a need to consider the implications this has for outer London communities and London's transport infrastructure.

Much of the job growth has been in high value sectors (such as professional, real estate and scientific and technical activities) again with the greatest concentrations of growth in these sectors being in inner London. However the cost of housing is impacting on the ability to fill graduate vacancies in these professional sectors. The housing crisis could lead to labour shortages (across all sectors of the economy) and / or increasing reliance on people commuting from greater distances to fill jobs.

Coupled with the growth in high value sectors has been the decline in employment in lower skilled jobs, which are forecast to decline further. This continued shift to a higher value economy has its benefits (particularly in terms of GVA growth), but it also presents challenges with regards to whether there are sufficient job opportunities available to the lower skilled population.

The sectors of the economy that will see substantial jobs growth in London are going to change, with greatest growth in professional, scientific and technical services (28% of all jobs growth 2015-2030) administrative and support (16%) and information and communication (10%)

and limited growth in financial services (0.6%) in what has traditionally been a big growth sector for London. Many of the businesses in knowledge based sectors are small scale and often rely heavily on affordable and flexible business space, rather than traditional office accommodation. With the continual loss of industrial and business space to competing land uses (such as residential) these sectors may find that land and premises availability and affordability act as a constraint on growth.

(for further detail on housing challenges facing London see section 4 pages 51-57 of Future Proofing London).

Society

Inequality in London is getting worse and poverty is shifting to the suburbs, compared to a decade ago when poverty was more evenly dispersed. Whilst the number of wealthy households in inner London has increased by 203% between 1980 and 2013. Recent data shows a large proportion of overseas buyers for inner London homes, and a high proportion of residents in inner London with second homes.

Despite the growth in London's economy, deprivation levels remain high in much of east and south east London. In west and south west London there are higher levels of residents with managerial and professional jobs and higher income levels than east and south east London.

There has been greater growth in those seeking job seekers allowance in outer London than in inner London and the growth in unemployment rates have been much higher in east and outer east London.

These clear patterns of suburbanisation of the less wealthy coupled with a forecast for more modest growth in job opportunities (particularly in higher value sectors) in outer London, will mean that the increased polarisation of London's society is set to continue. The implications of this are likely to be

- greater social unrest impacting on stability of the city
- reduced social mobility and loss of human capital, which ultimately can limit economic growth and innovation
- poorer physical and social health as a greater section of society find it difficult to access social and cultural opportunities
- more volatile economic growth

(for further detail on housing challenges facing London see section 4 pages 58-64 of Future Proofing London).

Environment

Environmental changes as a result of both climate change and the Cities population growth have the ability to impact on London's economy and society.

There is a significant amount of residential, commercial and community premises and vital infrastructure that is within the Thames tidal floodplain. Climate change could lead to increases in sea levels which in turn will increase the risk of tidal flooding and increases in heavy rainfalls

leading to an increased risk of fluvial flooding. With the potential for significant loss of life and damage to property there will be a need to ensure that London invests appropriately in ensuring its flood defence infrastructure is fit for purpose.

Surface water flooding is also a key issue and likely to increase as development of the city continues and climate change impacts take hold. London is vulnerable to surface water flooding with 16 of London's boroughs identified in the top 20 districts in England as susceptible to surface water flooding.

London is one of the most water stressed cities in the world. With an increasing population the issues related to water scarcity are likely to increase. London will need to consider how it manages water demand downwards and or looks to secure water supplies in a different way, although it will be vital that any alternative water supplies are sourced sustainably.

London is susceptible to Urban Heat Island effect due to the high-rise form and density of development. Increasing summer temperatures have the potential to lead to a greater number of heat-related deaths, an increase in respiratory illness and a decline in labour productivity.

In addition to the environmental risks associated with climate change, air quality is another challenge that London faces as it continues to grow. The majority of pollution in London comes from transport and congestion. The additional growth that is expected in London will generate additional trips with a further impact on emissions. Air quality is a significant challenge for the city as poor air quality is harmful to human health and ultimately reduces the quality of life in London.

(for further detail on housing challenges facing London see section 4 pages 65-68 of Future Proofing London).

National Infrastructure Commission

Balfour Beatty's submission to the National Infrastructure Commission inquiry into future investment in London's transport infrastructure

1. Introduction

Balfour Beatty is a leading international infrastructure group. With 20,000 employees across the UK, we provide innovative and efficient infrastructure that underpins our daily lives, supports communities and enables economic growth.

As this country's largest infrastructure Group, Balfour Beatty has more than 100 years of experience globally, and draws on the engineering skills and innovation of over 20,000 highly committed employees across the UK. Balfour Beatty finances, develops, delivers and maintains the increasingly complex infrastructure that underpins this country's daily life – in transportation, power and utility systems, social and commercial buildings. We are committed to London. From the Crossrail Liverpool Street and Whitechapel Station tunnels, to the £590 million Heathrow Terminal 2B project and the £300 million Aquatics Centre for the London Olympics, Wembley stadium, the Channel Tunnel Rail Link and soon the £416 million London 'Super Sewer' scheme, our expert teams have for many years helped to make the London landscape – both visible and invisible – what it is today, ensuring it can to continue to grow as one of the world's leading capital cities.

This note draws on our expertise to set out some of our thoughts on the key questions relating to the future of London's transport infrastructure.

London is facing unprecedented population growth, projected to reach 10 million by 2030 and more than 11 million by 2050¹. In order to support this growth, London's infrastructure will need continued investment to ensure it can maintain its status as a world class business location, competing with other top tier cities around the world and acting as a driver of the UK economy. Of course, significant transport investment is already underway in London, from Crossrail 1 to High Speed 2 and Thameslink, but more is needed. For example, much of London's commuter rail network is already operating at capacity in peak hours: additional capacity is required to tackle existing overcrowding and to support future growth.

Infrastructure requires vision, ongoing investment and consensus. Major projects take years to plan, build and develop; they are often disruptive to everyday life, especially in densely populated London, and their benefits are not felt within one electoral cycle or immediately understood by the public. The costs of disruption in London are high and the design of old-fashioned legacy systems often constrains options today. Prioritising and realising large projects requires political will. As much as possible, consensus is required for good infrastructure planning. The Olympic Park, where Balfour Beatty constructed the award-winning London 2012 Aquatics Centre, is a good example of what can be achieved with cross-party political support, while other worthwhile projects either do not happen or are slowed considerably if they do not have it.

¹ London Infrastructure Plan 2050, Mayor of London

In our view, there is a real need for clear long-term plans that have cross party support. In March 2015, the Mayor launched a long-term infrastructure plan², with the objective of setting out London's infrastructure needs and how to pay for them. As part of this, London's Infrastructure Delivery Board³ was established to bring together the interested parties in developing the programme of infrastructure works and advising on their deliverability, enabling the Mayor to seek to gain cross-party support. While Balfour Beatty welcomes the establishment of the Board, this body is still very new and has no statutory role, so it remains to be seen how effective it will be.

Balfour Beatty strongly supports investment in London's infrastructure. We believe that it is important not just to maintain London as a global city and to ensure that those that live and work there have access to the services they need, but that continued investment in the capital is vital to the UK economy as a whole. However, we would caution that investment in London or in the North of England should not be viewed as a 'zero sum game'. The two should be considered together for the good of the national economy, and both should see increased and sustained investment.

2. Responses to specific questions outlined in the Inquiry

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The challenges facing London are, in our view, mostly linked to its continued and rapid expansion. How to house the increasing population, how to transport people around the capital, and how to accommodate their other infrastructure needs including access to office space and business parks such as Tech City and the Advanced Business park, for example. There are of course many other social challenges, such as community cohesion, which we do not feel qualified to express views on. Here we outline a small number of the main challenges which we do have experience of:

- Delivering and maintaining infrastructure: London's transport infrastructure is already struggling to cope with current peak demand, a situation which will be further compounded by population growth and by plans including as High Speed 2 (HS2): the first phase of HS2 is due to open by 2026, which will mean large numbers of additional passengers to Euston station, where the Underground station is already at capacity. The opening of the second phase of HS2 in 2033 will place further burdens on routes to and from Euston.

A key economic challenge lies therefore in ensuring London's infrastructure is up to scratch. This is a twin challenge of planning and delivering new infrastructure; and ensuring the efficiency and maintenance of the city's existing infrastructure. The ability to rise to this challenge relies, in our view, on the level of forward planning and ability to adapt to changing circumstances and of course it requires regular and sufficient investment. Furthermore, infrastructure investment is most effective when developments are integrated from the initial vision, through the planning process all the way to implementation. Projects such as the Channel Tunnel Rail Link, the Jubilee line extension and Crossrail show what can be achieved when these requirements are all delivered.

While we understand that it is not part of the NIC's remit, we also believe that an early and final decision on aviation capacity in the South East needs to be taken. Of our closest competitors, Frankfurt has four runways; Schipol, six runways; and Charles de Gaulle has four runways. The continued delays are, we believe, damaging the UK's competitiveness.

² Ibid

³ <https://www.london.gov.uk/what-we-do/business-and-economy/better-infrastructure/london%E2%80%99s-infrastructure-delivery-board>

- Housing shortage: Currently, fewer than half of London's target of 42,000 homes are being built, and the numbers seem to be going in the wrong direction: there were around £4.5bn in orders for new housing construction in London in 2014/15, down 16% from the previous year⁴.

The housing shortage has a number of economic impacts. Low and middle income earners are being increasingly priced out of London. Increasing house prices are negatively impacting firms' ability to recruit and retain staff: the CBI/ CBRE London Business Survey⁵ found 32% of businesses saying that they are unable to offer flexible part-time employment due to the time/cost of the commute into London for employees who cannot afford to live locally. Similarly almost a third of firms said that employees are moving away from the local area and therefore having to leave their jobs as housing costs are too high. This is problem employers are facing now, but it is likely to get worse in future, especially for key workers such as nurses and teachers.

As some employees are forced to move further out of the capital due to rising housing costs, getting people from London's outer regions and from the wider country into London quickly and affordably is key. Transport connections are vital for commuters and Crossrail 2 will play an important role in facilitating these journeys.

Another point to consider if London is to deliver a greater amount of housing stock, is that density levels within the city may need to increase. London is not dense in comparison to places like Hong Kong for example. Discussions will be needed around the level of density that is acceptable and where this will take place.

Of course, the social angle of the housing shortage is significant. The most recent report on London poverty outlines that 1.2 million Londoners in poverty live in a working family, up 70% over the last decade⁶. The report highlights that, in a continuing trend demonstrated in the four previous editions, a key driver of poverty in London is the affordability of housing. With a shortage of affordable housing, the only option for low-income households is private renting, however, rents have increased by 19% in London in the last five years (compared to the 11% average across the country) resulting in an average private rent of £1,600 per month (more than double the £770 average in England)⁷. Indeed, average private sector rents in London are more than twice the national average for all property sizes⁸.

- Skills: London is a global city, a member of small elite group of cities that competes in an international market to attract highly skilled mobile workers in areas such as creative and media, financial services, IT software and global services. A well educated workforce and a deep skills base are crucial to enable it to maintain its position as a global city, and one which continues to see significant economic growth. However, every year India and China educate more than four million graduates, compared with just over 250,000 in the UK⁹. If something were to significantly reduce the flows of skilled immigrants from overseas into London that recent years have witnessed, this problem is likely to be compounded.

⁹ Europe Economics, The Competitiveness of London – Future Challenges from Emerging Cities, 2008

In the infrastructure industry, designing, constructing, operating and maintaining the infrastructure which keeps London moving requires specialist skills and experience. In order to make sure we have the skilled labour necessary to build the transport networks, buildings, rail and runways and so on, it is important to ensure that London develops and retains the required level of skilled resource. Business needs confidence in the quality of the pipeline in order to ensure it has the skilled staff for some of the specialist roles in major projects. This is especially the case where new skills are required for innovative schemes.

Balfour Beatty welcomes and supports the government's ambitious plans to create 3 million more apprenticeships by 2020. We invest in apprenticeship programmes across a broad range of disciplines, employing over 150 apprentices each year in the UK in addition to the 320 currently under training in a diverse range of roles across the business¹⁰. We employ around 700 more young people on graduate and part-time higher education / degree schemes. However, we do not believe that the apprenticeship levy alone will be enough to meet the shortfall in skilled workers the infrastructure industry needs.

- Flooding: Of course, the impact of flooding from the Thames would be disastrous: not just in terms of the number of businesses and dwellings sited in London and the fact that London is the UK's largest centre of activity, but the Central Government district of Whitehall is also almost entirely within the Thames floodplain. Furthermore, the damage to London's transport infrastructure would be significant: much of the central area of the Tube network is based within the floodplain and 86 railway and underground stations, eight power stations, 1,000 electricity substations and 16 hospitals could be at risk¹¹.

However, assuming that the Thames Barrier continues to perform and that the Thames Estuary 2100 plan works, the other, less manageable threat is in the form of surface water for example, following prolonged heavy rainfall in the Thames catchment area. The amount of impermeable surface cover in London, such as concrete on pavements and buildings, means that rainfall runoff from the land into the drainage systems and rivers creates a build-up of water and potentially fluvial and surface water flooding. Drainage systems may have inadequate capacity or become blocked leading to further flooding. The more building there is and the less green space, the more pronounced this problem becomes. Climate change, with its projected extremes of weather and wetter winters, is likely to add to this and the City of London have identified surface water flooding as one of the most serious challenges London faces¹². Therefore robust and effective management strategies and flood resistance and resilience measures need to be put in place in order to mitigate the risks and opportunities for integration should be capitalised on. For example, the capacity of green space to reduce flood risk is rarely factored into the planning or design of parks.

- What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Balfour Beatty's priorities for strategic investment options for London are:

- A. Crossrail 2: Crossrail 1 will deliver a 10% increase in transport capacity east to west. However, it will not address the issues of congestion levels on north-south tube and rail lines

¹⁰ <http://www.balfourbeatty.com/index.asp?pageid=364>

¹¹ The Environment Agency's "at risk" list, 2015

¹² <https://www.cityoflondon.gov.uk/services/environment-and-planning/sustainability/climate-change/Pages/surface-water-flood-risk.aspx>

and the need for significant additional capacity due to projected population growth. We believe that a new north-south line linking Wimbledon to Hackney across central London and extending into the suburbs, linking in with London Underground, London Overground, Crossrail 1, National Rail, High Speed 1, High Speed 2, London Trams and international rail services, should be approved as a matter of urgency. The urgency relates both to the need to address the two problems outlined above, but also to the need not to lose the skills and knowledge gained from Crossrail 1 due to a time lag between the two projects. The priority, in our view, is to plan the new rail line in conjunction with housing and regeneration needs.

Firm decisions on the route, a construction timetable and a credible funding package need to be made as soon as possible. We furthermore believe that additional Crossrail lines could follow.

- A. London Underground: As well as developing the new Crossrail 2 line, line upgrades and station works are still necessary to maintain a resilient underground system. We agree with Transport for London that, even with the new capacity the Tube upgrade is bringing online, it will not be enough to meet London's future needs. Investment must continue across the wider tube network: we must ensure that journeys are seamless across the whole network. There will be little point having a good quality, fast Crossrail 2 if the onward tube connections are prone to signal failure, over-crowding and delays.

Furthermore, the areas that are opened up by Crossrail 1 and the potential Crossrail 2 will mean that more people from those areas access the Underground for their onward journeys. Constant upgrades and developments must therefore be factored in as a priority.

- B. New East London river crossings: We agree with the Centre for London report¹³ that there is a need to address the severe lack of crossing capacity on the East Thames. There are three crossings to the east of Tower Bridge, compared to 16 road crossings on the 20 miles of the river west of Tower Bridge. All three of the eastern crossings are regularly congested. However, the population of East London is forecast to increase by 600,000 in the period to 2031¹⁴, and this area of the capital is a key priority for regeneration, housing and jobs.

We support a minimum of two bridges at Gallions Reach, which would connect Thamesmead with Royal Docks; and at Belvedere, which would connect north Bexley with Havering. These options were the two identified by a recent TfL consultation which received 7,500 responses, 90% of which were in favour of new river crossings in east London. The two new crossings would form part of a package alongside the Silvertown tunnel, which would connect the Greenwich Peninsula with the Royal Docks and would play a key role in supporting the population and employment growth forecast for London.

Balfour Beatty believes that the success of the toll bridge at Dartford suggests new projects could be paid for with private finance and money recouped from those using the crossings.

- C. An orbital underground ring road: This would relieve congestion around Tower Bridge and Old Street, as well as the Old Kent Road, the A40 around Acton and the A503 at Woodberry Down.

¹³ Centre for London, Linking London: A New Generation of River Crossings to Revitalise the East Thames, October 2014

¹⁴ TfL, 2015

There are also other points to consider in relation to improving London's future infrastructure, for example:

- One of our observations from our work elsewhere in the world is that, when large-scale infrastructure projects are delivered in this country, opportunities are often missed for infrastructure integration. For example, the Crossrail tunnels that are currently being built could have included broadband fibre, but will not because decisions were not made at the right time. We need to become better at considering all future infrastructure needs upfront at the inception of major projects.
- It should not all be about new infrastructure. Work is also needed to improve the capital's road network and ensure that it is fit for purpose for the projected population increase. Congested roads are a strain on the economy and the environment, impacting London's competitiveness and Londoners' overall quality of life. In our view, smart technology is needed to deal with bottlenecks at traffic junctions for example, including some of the Dynamic Traffic Forecasting methods being used in Barcelona, digital road signs, junction technology and encouraging sat-nav companies to give drivers better real time information. We support TfL's £4 billion Road Modernisation Plan and believe that it could potentially go even further, with an extension to the congestion zone, or an amended charging regime where costs vary based on those roads and times of day where congestion is worst.

3. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- Building on the Crossrail 1 model: Decisions about public expenditure on London's infrastructure investment are often not taken in such a way that the costs, or at least some of them, are borne by the people who benefit. However it is estimated that local funding sources could meet at least half of the costs of Crossrail 2¹⁵, in part by building on the Crossrail 1 model. This would include ideas such as increasing fares and building on the idea of the Olympic precept for Council tax payers. While these options may be politically unpopular, it is our view that they should be considered in line with the principle that those who benefit should carry some of the burden for the funding. It is in cases such as these that political consensus around future infrastructure priorities is important to achieve.

The Crossrail funding model is interesting in that it brings together a number of sources of funding and financing. Most notably in terms of alternative funding mechanisms it includes a supplementary business rate on larger London businesses of two pence in the pound for approximately the next 30 years. This approach was largely welcomed by London business, which is broadly supportive of the principle that tax and spending decisions should be better aligned. We support work that has been done by PWC¹⁶ and others on demonstrating how a continuation of the Business Rate Supplement and the application of a Mayoral Community Infrastructure Levy could meet 21% of the costs of Crossrail 2. The benefit of these methods having been used in Crossrail 1 lies in the fact that the principle has been established and in the learnings that can be taken from the operation of the schemes.

- Land value uplift / Tax Increment Financing (TIF): Infrastructure investments decisions need to consider all their economic returns from the outset, for example, by capturing increased land values around schemes due to improved transport connections. TIF can enable local

¹⁵ Michele Dix, TfL presentation on Crossrail 2, June 2015

http://www.newlondonarchitecture.org/docs/michle_dix--transport_for_london-1.pdf

¹⁶ PWC, Crossrail 2 Funding and Financing Study, November 2014

authorities to raise funds for infrastructure improvements which will increase economic activity in the future. It has been widely and successfully used in the US and in Hong Kong for many years and is beginning to be used in the UK. One of the conclusions from PWC's analysis is that:

"many land and property owners who have benefited most from the project are not making a commensurate contribution to the project costs"¹⁷.

Crossrail 1 is projected to add more than £5 billion¹⁸ to property values along its route, only a fraction of which is being captured to support the cost of the line. More should be captured in plans for Crossrail 2, which would reduce reliance on national taxation. This is something that could and should be addressed in advance of Crossrail 2.

- Dividing the burden between interested parties: Subdividing major projects into smaller sections with bespoke financing/funding arrangements. For example, the bulk of the project, for example the tunnelling could be simplified and funded centrally, but station development and other elements could be funded and justified separately by local authorities and/or private sector developers.
- Private sector investment in infrastructure: Although there are Pension and Infrastructure Funds for example, which could invest in London infrastructure, their investments are subject to market and policy risk. They require policy certainty from government in the form of clear up-front statements of government policy in key strategic areas, ideally, government guarantees, better coordination within government and rapid implementation of the detailed policy frameworks which can provide the certainty and longevity which the private sector needs to make the business case for infrastructure investment. While this is unlikely to be a viable option for Crossrail 2, due to the size of the scheme, it is possible that private investment could be used for other London infrastructure projects.

Much of the investment in UK infrastructure is undertaken by international businesses which have a choice of markets and projects for their scarce capital, and they will naturally choose those jurisdictions with effective policy frameworks which provide certainty over the longer term over jurisdictions which do not.

Balfour Beatty believes that commitments to long-term infrastructure plans would reduce the cost of delivering infrastructure in London and elsewhere in the country. Longer-term plans teamed with the certainty that they will be followed through would also enable the whole industry to ensure the right resources – both in terms of skills and assets - are in place to deliver. Without this certainty, for example, providers cannot start training the workers needed in the future or ensure their supply chains are in place.

CALL FOR EVIDENCE

Further to the call to Evidence for the National Infrastructure Commission we have pleasure in detailing some issues and points relating to the national challenges.

1. Improving connectivity between cities in the North of England

Recommendations for cost effective infrastructure investment

Improve the local transport infrastructure to facilitate cross-country links such as Northern Hub

One way to increase employment, housing and enterprise growth will be to concentrate on local transport improvements to facilitate cross county links such as the Northern Hub solution.

Improvements in local transport links and high quality infrastructure are essential for the North of England as they will not only benefit the communities that live there, but also those visiting / commuting to the region which is vital for the local economy.

This focus requires immediate action with full and proper collaboration across all parties including the deliverers.

Provide Superfast Broadband

Superfast broadband makes a positive impact on national and local economies. For the North of England, an area of improvement that will assist in resolving many issues is the improvement in connectivity of IT by supplying super-fast broadband (400MB+) across all the Northern cities.

Faster broadband allows a workforce to work more flexibly which can lead to greater productivity and reduced travel meaning time and money saved.

This solution is relatively low in cost and requires future proofing for at least five to ten years.

Priority early-phase investment

Improvements between Liverpool to Manchester and Leeds, then Teesside to Newcastle

As Sir David Higgins said *'Improving connectivity is vital, if Britain is to compete in the knowledge economy in which this country has a competitive advantage, but in which ease of travel is an essential element'*.

A main focus should be made, firstly, on the Liverpool to Manchester and Leeds connectivity in highways, rail and water.

This should then be followed into Teesside and Newcastle.

The governance of delivering this infrastructure and its subsequent growth needs careful consideration as the devolvement of power and funds to a region is not always cost effective.

The Northern Powerhouse needs to evolve in the same way as TfL - with close collaboration with all stakeholders involved. This will prove very effective, as it has been for London.

Whether the same can be said for the other local authorities and LEPs is questionable, therefore, effective and efficient business cases need to be agreed with monitored results and programmes.

Effective governance

Considerations for finance and funding

The funding of schemes and developments should be considered to prioritise and obtain a greater input for those that will reap the most benefit eg Crossrail 1 and business investment with developers for flood protection.

Many opportunities can be considered within a portfolio finance model with funding and support from organisations outside of the public sector. This is something innovative but difficult to obtain without buy-in from authorities that tend to revert to traditional procurement methodology.

2. London's transport infrastructure

The challenges facing London and recommendations

London is one of the most rapidly growing and congested cities in World. Hundreds of thousands of people travel to and from London for work via overcrowded networks because they have to.

A question to consider: *'Is the relentless growth in London really viable for the future?'* And *'How can this problem be alleviated?'*

Our recommendation, to overcome the infrastructure capacity challenge faced by London, is to invest heavily into adjacent regions and towns surrounding the Capital. If these areas become better and more efficiently connected, accessible and attractive, the problems faced by London will be reduced as fewer people are forced to rely on the London network.

Strategic options for future investment in large-scale transport infrastructure

Short-term solutions

In the short term we need to:

- Enable high speed connectivity and continue to improve rail capacity for the inevitable commuter journeys
- Consider how to develop 'metro type' services - improving signalling and platform usage while bypassing loops in the service
- Provide 24-hour transport services to the rail system to give passengers the ability to change their patterns of travel without any fears of accessibility to and from their place of work. Essentially dissolving the rush hour.
- Embrace the use of applications including UBER within the road network, to obtain increased usage of the highways, relieving strain on infrastructure and transport networks.

Medium-term solutions

In the medium term we need to:

- Resolve the airport aviation issue and ensure we put in place the new runways required.
- Prepare for the future: The introduction of driverless cars is inevitable and we need to anticipate the impact of this mode of transport relative to existing forms. We must therefore develop a transport strategy that combines mass transit with electric and driverless vehicles to ensure our infrastructure is prepared for future innovation.

Long-term solutions

In the long term we must:

- Consider and action infrastructure finance through Value Capture and learn from other past examples of success not only in the UK but from Europe and the US.
- Consider the sharing of knowledge with other Government deliverers and customers throughout Europe and the US. This needs greater emphasis.
- Develop best practice. From a BAM perspective, our nine other international Group companies give a huge depth of learning and best practice which can be shared with others to drive continual improvement in the UK's infrastructure. This needs to be captured to benefit business practices
- Joining together of regulators, especially in the South East, but also across the country, in a forum to give traction and commonality of thinking would provide increased best practice and value savings
- Respond to future plans. The London 2050 Infrastructure Plan includes a wider audience such as Manchester and the outlying regions. This needs positive collaboration and leadership.
- More Mayoral control would bring benefits as it has to date in London – especially in the housing and asset support sectors

Finally, the use of land in the London area and regions needs some firm leadership and direction to spur development and investment. A Mayoral lead in this, again, would be benefit, reducing the negativity realised from Local Authorities.

Opportunities to increase benefits of Crossrail 2

An option for London to consider is whether to build a new metro system, supporting the existing one and complementing the connections that already exist.

CRL1 and 2 would be part of this but further long-term new systems will need to be planned if the growth becomes the 10m as predicted.

On Crossrail 2 we need to be certain of the problem that is to be solved before deciding on the solution. An agreement on what to spend and what must be done to solve the problem should occur before collaborating to achieve the outcomes.

Initial arrangements must be made that meet the budget before any decisions are made on which project to build. Issues such as station locations, tunnel alignment and conservative settlement criteria all have disproportionate cost impacts. These elements need thorough and open discussion with all stakeholders.

Options for the funding, financing and delivery of large-scale transport infrastructure improvements in London

High Speed 2 (HS2) – using Euston not Old Oak Common

Other issues in the London sector are the immediate provision and development of Old Oak Common with the investment and expansion that will follow using the Greenwich and King's Cross models. Simultaneously, HS2 must enter central London at Euston and the development of this facility needs urgent and immediate commitment. Old Oak Common as a terminal to HS2 is not a solution, however,

Euston certainly is. Connectivity to HS2 from Heathrow and other potential outlying areas including Crewe requires immediate commitment and collaboration between all stakeholders in order to make HS2 successful.

Lessons learned which can be applied to London

Sharing knowledge and information is crucial to long-term improvements – building on the success of the Olympic and TfL delivery models.

It is essential to learn from our previous experience and move away from employing the services of advisers with no real incentives. We must also move away from the use of bespoke contracts when we can make positive use of past success such as the Olympic Delivery model and programmes employed by TfL especially in the streets section.

Using Building Information Modelling (BIM) to streamline delivery programmes

The entire 'Process of Delivery' of projects and all 'Programmes of Work' need considering so that construction is fully considered through from procurement to maintenance using BIM to its fullest capacity. We need to discover efficiency of procurement, construction and long-term maintenance that delivers value to customers.

BRITISH PROPERTY FEDERATION RESPONSE TO NATIONAL INFRASTRUCTURE COMMISSION

The BPF represents companies owning, managing and investing in commercial real estate. This includes a broad range of businesses comprising commercial property owners and developers, financial institutions and pension funds, corporate landlords and residential landlords, as well as all those professions that support the industry.

Introduction

1. We welcome the opportunity to respond to the National Infrastructure Commission's call for evidence. Commercial real estate is a key component of the UK's infrastructure, providing the homes, offices, health premises and distribution networks we need for the country to thrive. Infrastructure is crucial to attracting the investment needed to regenerate the UK's town and cities, and the establishment of the Commission is a welcome step in ensuring swift, coordinated decisions over important projects which will ensure clarity and certainty for investors, business communities and local residents.
2. The BPF has a wide range of members with diverse property and development interests across the country. We have therefore kept our response to high level points rather than recommending individual projects or schemes be prioritised.

London's transport infrastructure

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

3. London is in a remarkable period of growth, with its population topping 8.6m earlier this year – the highest since its 1939 peak. With this projected to reach 11m by 2050, there will be unprecedented pressure on existing infrastructure. The required infrastructure spend for the capital has been estimated at £1.3 trillion to 2050¹, and finding the necessary funding will present a huge challenge.

Housing

4. The availability and affordability of housing likewise poses a major challenge to London and its inhabitants, and this will continue and potentially worsen with predicted population growth. This will affect a wide range of people, from students to the elderly population. The capital has in recent times led the way in recognising the opportunities to add to housing supply by providing different models of housing and a variety of tenures, and this is warmly welcomed.
5. For example, the Build to Rent sector has taken time to reach a critical mass but is making good progress at adding to housing supply with 7,000 units in the London development pipeline. Whilst central Government has been very supportive in reshaping planning guidance to reflect this new phenomenon of pension fund investment in large-scale rental housing, it has taken time to inform and educate local authority planning officers and politicians about this sector and we would urge all involved to recognise the benefits of attracting investment to areas in this way.
6. There is also an excellent opportunity to plan housing delivery in London hand-in-hand with infrastructure. For example, land freed-up by Network Rail and Transport for London (TfL) is proving attractive for build-to-

¹ 'The Cost of London's Long-Term Infrastructure' Arup, July 2014

BRITISH PROPERTY FEDERATION RESPONSE TO NATIONAL INFRASTRUCTURE COMMISSION

rent development, providing high density quality rental accommodation, near to transport modes, for key workers and other employees. TfL have gone so far as to look at Joint Ventures that will allow them to be part-owners of build-to-rent schemes, and therefore generate income to help fund their other work.

Health services

7. With a rising population, the strain on the city's health services will become increasingly apparent. Already nearly two thirds of London's general practices perform worse than the England average in terms of overall patient satisfaction; three quarters are in need of rebuild or repair; and a third is not compliant with the Disability Discrimination Act². There is a significant amount of private capital available from investors ready to work with the public sector to invest in new premises, but this will require long-term strategic thinking from Clinical Commissioning Groups (CCGs) which are only beginning to adjust to their new roles, and a commitment from Government to increase the revenue funding to allow for improved GP premises.
8. London is likely to face care-related challenges presented by the ageing population over the next twenty years. While the average population of London is younger than the national average, the number of people aged over 65 is set to nearly double by 2029³. Given that there is currently only 28 care beds per 1,000 people aged over 65 in the Greater London area and only 1 bed per 1,000 people aged over 65 in the development pipeline⁴, coupled with the fact that people will on average spend two and a half years of their lives in a care home, this is likely to lead to a severe shortage of suitable residential care homes for the city's population.

Town centres

9. As is the case across the country, the role of London's town centres has changed in recent years. There has been a restructuring of retail habits with online shopping becoming increasingly popular; and in some areas there is a surplus or the wrong type of office space.
10. Rather than allowing high streets to fall into decline, there are opportunities to develop residential growth on high streets; to create affordable and flexible new workplaces (for example through the use of pop-ups); and to ensure visiting town centres becomes a positive and attractive experience. Indeed, some London boroughs are already taking these opportunities and we would encourage the Commission to take into account these examples⁵.

What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

11. Land assembly remains a key challenge in the delivery of these projects, as ownership is often disparate. With much of the land in the hands of local authorities and other public sector bodies such as TfL or Network Rail, they have a key role to play in delivery. Structures such as Development Corporations have proved successful in bringing together land and the key players to coordinate processes. For example, 70% of the land involved in the Old Oak Common HS2 and Crossrail station scheme is in the ownership of public sector bodies and is being brought together in the Old Oak Common Park Royal Development Corporation.

² 'Better Health for London' London Health Commission, October 2014

³ 'Population Growth and Ageing' London Medicine & Healthcare, 2013

⁴ 'UK Healthcare Development Opportunities 2015' Knight Frank, December 2015

⁵ 'Building on Success – London's Town Centres' London Councils, 2015

BRITISH PROPERTY FEDERATION RESPONSE TO NATIONAL INFRASTRUCTURE COMMISSION

12. Some of the most innovative delivery we see is where our members work in partnership with local government through joint ventures and other structures, where public land is invested as part of the partnership arrangement. These can offer local councils valuable income from, and ongoing controls of their public land rather than outright sale to the highest bidder for that land. But many councils remain nervous of best value rules and we believe there needs to be clearer guidance on what is allowed.

- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

13. London in particular has funded the delivery of schemes through a tax on commercial real estate, with Crossrail partly funded by a business rates supplement introduced in 2010, s106 obligations and by the mayoral Community Infrastructure Levy introduced in 2012. Mechanisms such as these can be useful, but have an impact on the viability of schemes and we would be concerned that solely focusing on them and under-utilising innovative mechanisms such as Tax Increment Financing (TIF) would stall delivery.

14. TIF allows local authorities to borrow against future business rates and reinvest this back into local regeneration schemes. TIF-style models have been utilised with great success across the country, such as to partly finance the Nine Elms extension of the Northern Line to Battersea Power Station Nine Elms extension of the Northern Line to Battersea Power station, and in Birmingham's Enterprise Zone on the Paradise Circus scheme, and there are lessons to be learnt from its application in these examples. We would welcome further discussions with the Commission on these examples.

15. The London Finance Commission Report 'Raising the Capital' included a number of comprehensive proposals on this, many of which could be revisited and would allow growth to be further unlocked.

16. We would be pleased to further discuss or amplify any points raised in our response.

Dear Lord Adonis

Call for evidence

I am writing to you on behalf of the Broxbourne Borough Council in response to your recent call for evidence published in November 2015.

Firstly, I would like to thank you for the opportunity to engage in this critical conversation regarding the future growth and prosperity of the nation. Broxbourne is an ambitious Borough that has significant plans for improving prosperity for residents and businesses and, to this end, we are very keen to work with the NIC to turn our ambition into reality. Ambition Broxbourne is the Borough's economic development strategy and mantra that drives partnership working to secure inward investment, nurture business growth, generate quality places and ensure that residents and workers have the skills the economy needs to thrive now and in the future.

Broxbourne Borough Council is a member of both the West Anglia Routes Group (WARG) and the London Stansted Cambridge Consortium, which are associations of public and private sector organisations from along the routes running from Liverpool Street and Stratford through north London into Essex, Hertfordshire and Cambridgeshire. These organisations are working together to promote economic growth including securing timely infrastructure investments. The Council is also represented in the West Anglia Taskforce Working Group. The West Anglia Taskforce will compile an evidence base to support rail infrastructure investment along the London Stansted Cambridge corridor and will report its initial findings to the Government in the summer of 2016.

The Council is currently developing its Local Plan which will set out how Broxbourne will grow and develop to become a more desirable and prosperous place to live, work and visit. It will be a development strategy for the next 15 years. The Plan will provide for homes, jobs, shops, transport and infrastructure - all set alongside the long term protection and improvement of our Green Belt, parks, open spaces and built heritage. An extensive evidence base underpins the preparation of the Local Plan. This has resulted in a detailed assessment of the levels of need within the Borough, counterbalanced against the capacity of the Borough to accommodate growth.

The Borough Council strongly supports the current Crossrail 2 proposals as part of Ambition Broxbourne. In particular, we recognise the critical role it will play in driving local and strategic economic growth and prosperity over the coming years, thereby ensuring that the economy remains competitive and able to nurture and sustain healthy and productive communities. This support has also been confirmed by the Ambition Broxbourne Economic Development Board; a cross sector grouping overseeing and driving the economic development plans for the Borough.

Broxbourne Council is a strong supporter of the regional route of Crossrail 2 because it will add capacity across the network, relieve pressure on key lines, and improve connectivity into and through London, whilst also supporting growth in jobs and homes and regeneration along the London Stansted Cambridge corridor. The Council also strongly supports the proposed provision for four tracking of all or part of the line between Tottenham Hale and Broxbourne to accommodate increasing demand for local services which would bring many benefits and opportunities to the Borough's residents and businesses.

In particular the Council has written separately to the Crossrail 2 team requesting an early opportunity to discuss any available designs in more detail with regard to:

- Broxbourne's ambition of having a new railway station in Turnford between Cheshunt and Broxbourne to support the creation of a new Borough Centre at Brookfield;
- Better connectivity between key strategic development sites and the existing and proposed railway infrastructure including, for example, the proposed commercial development at Park Plaza and the Southbury Loop railway line;
- Programme of level crossing closures;
- Details of stable location near Broxbourne;
- Future of brick bridge over the railway near to Broxbourne Railway Station;
- Proposals for upgrading Waltham Cross, Cheshunt and Broxbourne stations;
- The possibility of developing a more permanent arrangement/local project office to facilitate closer joint working; and
- Financial programming of Crossrail 2

In addition, there is a need for significant improvements to the A10 in supporting growth in housing and employment especially with regards to the planned expansion of Brookfield (to create a new Borough Centre) and Park Plaza (a significant employment allocation). The initial phase of transport modelling is now complete and it was found that there are many capacity constraints at the following locations:

- A10 Great Cambridge Road/ Church Lane
- A10 Great Cambridge Road/ College Road
- A10 Great Cambridge Road/ A121 Winston Churchill Way/ B198 Lieutenant Ellis Way
- M25 J25/ A10 Great Cambridge Road
- A10 Great Cambridge Road/ A1055 Bullsmoor Lane

Further transport modelling is underway to provide more detail and help develop proposals to remedy these issues. Investment in the A10 will also support current planned investment in junction 25 of the M25, help address congestion issues in Enfield, support growth further

north along the A10 corridor in East Hertfordshire District and improve connectivity with Cambridge (with regards to growth in the Life Sciences sector) and Stansted Airport. Therefore we consider that it is critical that these issues and associated improvements are recognised and supported through the NIC. The Council would welcome continued engagement with TfL, Network Rail, Highways England, the National Infrastructure Commission and other key stakeholders to ensure that Crossrail 2 and other strategic infrastructure investment can maximise the potential benefits both locally and nationally.

Overleaf is the Council's more specific response to your call for evidence under your published questions but specific to us.

In conclusion, we are an ambitious Borough and strongly believe that, like other areas within London's hinterland, we play a critical role in its success and have a vital role to play in London's future to ensure it remains a global core city generating and driving national and international economic prosperity. We would be more than happy to host a meeting of the Commission to spotlight how key investments, such as Crossrail 2, will unlock the potential of Broxbourne for the benefit of London and the nation.

If you require further information, or wish to discuss any of the feedback, then please contact Alf Cuffaro on 01992 785539 / alf.cuffaro@broxbourne.gov.uk.

Yours sincerely

[signature redacted]

Greg Macdonald
Director of Community and Economic Development

1. What are the major economic and social challenges facing the Borough of Broxbourne over the next two to three decades?

Housing

The Council has assessed a need for 419 new homes per annum between 2014 and 2031, a total of 7,123 homes. New homes built between 2014 and 2015 would be discounted off this figure but the total need would be around 2,000 new homes in excess of the provision that the Council was planning to provide for prior to the publication of the Government's 2015 household projections. Prior to these projections having been produced, the Council was already faced with making very difficult choices about Green Belt developments. Nevertheless, further review of the Green Belt and of urban capacity has identified sites that could accommodate approximately 6,000 new homes in total. That is the number of new homes that the Council is currently proposing to consult on within the draft Local Plan. This would increase the number of new homes within Broxbourne from 39,800 (2014) to approximately 46,000 in 2031. 6,000 new homes falls short of the identified need and an option could be to meet the full need for in excess of 7,000 new homes. However, at this stage, the Council believes that to meet the need in full would have an unacceptable impact on the aim and purposes of the Green Belt as well as on the ability of Broxbourne's infrastructure to cope. We consider that the redevelopment of stations along the Crossrail 2 route will provide opportunities to innovate and explore new ways of meeting and exceeding this housing requirement.

Population

The current population of the Borough is approximately 96,500. In 2031, the Government predicts that the population will have increased to 109,100. This will be as a result of natural growth in the resident population and a net increase of people moving into the Borough, primarily from London. The Government's population projection is consistent with the number of new homes that the Council is planning for over the Local Plan period.

Employment

It is not proposed that the allocation of land for employment will follow a "needs" based approach. The Council considers that the proposed employment sites should be promoted to maximise the opportunities to meet the employment objective and to diversify the employment base of the Borough. The protection of existing employment areas and the promotion of new ones align closely with Ambition Broxbourne, the Council's economic development strategy, and with the Strategic Economic Plan of the Hertfordshire Local Enterprise Partnership. It is estimated that the new employment opportunities identified to date would result in approximately 7,500 new jobs being created within the Local Plan period. There is a tension between housing and employment growth that we are currently reviewing through the Local Plan with the potential release of strategic sites within the greenbelt.

Shopping and Leisure

The Council has a long standing ambition to reduce the unsustainable leakage of retail expenditure outside the Borough and to provide its residents with better access to high quality shops. The Council's retail needs assessment identifies capacity for between 9,400 m² net and 13,200 m² net new convenience goods floorspace to 2030. It also identifies capacity for between 25,000 m² and 45,000 m² net new comparison goods floorspace to 2030. The proposal for a new Borough Centre at Brookfield will provide additional space.

Schools

Hertfordshire County Council has identified a need for significantly more primary and secondary school floorspace to be provided by 2031. The potential to expand existing schools has been fully assessed and there still remains a need for one new secondary school and up to eight new primary schools within the Local Plan period.

Health

At this stage, a need for two new/extended health care facilities within the Local Plan period has been identified and it is intended that provision will be made accordingly

Green Belt Releases

Urban and brownfield sites cannot meet all of the development and infrastructure needs and provide for sufficient opportunities for the future development of the borough. The nature and location of town centres and railway stations limit the scope for significant additional development in and around such locations without major redevelopment that is not considered practicable or desirable within the lifetime of this Local Plan. Intensification of existing residential areas would adversely impact on the suburban character of much of the Borough and would not provide the means to ensure the delivery of appropriate infrastructure to support development. The potential to reuse employment land for housing is limited given the Council's aspirations and objectives to promote economic growth and development. Alternative options have been carefully considered and in Broxbourne the Council has concluded that planning for the Borough's development needs can only be achieved through the strategic release of some Green Belt land.

Broxbourne currently has some 3,300 Hectares of Metropolitan Green Belt. The Council has prepared a Strategic Green Belt Review that divides the borough into eleven broad areas and looks at how these areas perform in terms of the aim and purposes of the Green Belt. This assessment has highlighted five broad areas that have very limited scope to accommodate development but also identifies six areas that have warranted further consideration in terms of their ability and capacity to accommodate additional development and associated infrastructure. These areas are: the lands between Hoddesdon and the A10; Brookfield and Cheshunt Park; Goffs Oak and Rosedale; Bury Green; the southern A10 Corridor; and lands between Wormley and the A10.

Examination of these areas has resulted in proposals being made to allocate lands to facilitate a number of strategic and edge of urban developments.

Town Centres and the Retail Hierarchy

The borough's town centres remain the hub of community life and their regeneration and improvement are priorities for the Council.

The Hoddesdon Town Centre Strategy was published in 2010 and has been the framework for the redevelopment of the Tower Centre and a range of development, improvement and promotional projects over the last five years. Successive annual actions plans have rolled forward those projects and a full review of the strategy is now proposed. It is anticipated that the following will form the basis of that strategy:

- Further public realm improvements in the High Street and beyond;
- The promotion of small, scale mixed use development sites;
- A gateway development into the town centre at and around Scania House;
- The provision of a mix of day and evening activities;
- Improved access; and
- Protection and enhancement of historic character.

The Waltham Cross Town Centre Strategy was published earlier in 2015. The key projects to be promoted through the Local Plan are:

- Redevelopment of the northern High Street for a mixed use residential and retail development. This would involve the relocation of Homebase and Wickes to Park Plaza North;
- Improved vehicle access through the northern High Street and a range of public realm improvements throughout the High Street and beyond;
- Additional homes in and around the town centre;

Retail Opportunities and the Retail Hierarchy

Opportunities for major new retail and leisure developments to meet the borough's needs within its existing town centres have been examined. However, the only clear opportunity is through the redevelopment of the northern High Street in Waltham Cross. To date, the site has received very limited interest from retailers to the extent that the Town Centre Strategy now proposes a mixed use approach with more limited retail content, an approach that will be reflected in the Local Plan. The only major opportunity for significant new retailing in the borough is at Brookfield. Given the increased retail content and the mix of uses proposed at Brookfield, the Local Plan will include a retail hierarchy that places Brookfield on the same level as Hoddesdon and Waltham Cross town centres. Floorspace levels and content of the centre will, however, be strictly controlled to ensure that it complements the borough's existing centres. Cheshunt Old Pond will remain as a District Centre and a range of neighbourhood and local centres will also be identified within the hierarchy.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in the Borough of Broxbourne - on road, and rail including, but not limited to Crossrail 2?

Transport Infrastructure

The Council is aware that new development will add more pressure to roads and rail services. The only significant new road planned within the Local Plan will be a new link from the existing Brookfield Centre to the Turnford Interchange on the A10. The emphasis will therefore be on managing traffic growth, improving the existing highway network - with a particular focus on the A10 - and on enabling local people to use alternative forms of transport. The Council is particularly supportive of proposals to 4-track the West Anglia mainline and to deliver Crossrail 2 into the Borough to increase rail capacity. As a result the Local Plan is proposing and supporting a range of transport projects as follows:

Road

- Additional junction capacity at the M25 junction 25 through the provision of new on and off slip-roads;
- Improvements to traffic flow through the A10 roundabout linking Lieutenant Ellis Way and Winston Churchill Way;
- The consideration of additional lanes on the A10, as far as possible within the confines of the highway boundary;
- Improvements to traffic flow through the signalized junctions with the A10 at Church Lane and College Road. The future role of these junctions within the wider road network will be examined;
- The northern extension of Brookfield Lane West from the Brookfield Retail Park to the Turnford Interchange on the A10;
- Improvements to the Sun and Hertford Road roundabouts in Hoddesdon;

Rail

- The implementation of Crossrail 2, a new dedicated rail link from Broxbourne to south London. The Council is currently supporting Broxbourne Station as the northern terminus for the majority of Crossrail 2 services;
- The construction of a new station between Cheshunt and Broxbourne at Turnford to support the creation of a new Borough Centre at Brookfield
- Four tracking of the West Anglia mainline to Stanstead Airport;
- Safeguarding of and continued improvements to stations in the borough - including longer platforms, additional parking and improved access;
- Better connectivity between key strategic development sites and the existing and proposed railway infrastructure including, for example, the proposed commercial development at Park Plaza and the Southbury Loop railway line;
- The extension of Oyster card services;
- The replacement of level crossings with appropriate alternatives.

Bus

- The protection of viable bus services throughout the borough;
- Expansion of Waltham Cross bus station in its current location;
- Creation of a new bus station at Brookfield;
- New bus service between High Leigh, Hoddesdon and Broxbourne Station;
- Reinstated bus service to Park Plaza, Waltham Cross.

Walking and Cycling

- Pedestrian and cycle connection from Park Plaza to Waltham Cross town centre;
- Improvements to the New River path including cycle use;
- Promotion of additional off road footpath and cycle links through the borough and connect to and through new developments;
- Greater access to the countryside for pedestrians, cyclists and horse riders
- Promotion of a walking and cycling strategy

The Council will also support transport projects outside the borough where they will ease congestion and provide additional services to residents and businesses within the borough.

Transport related priorities and potential impact

An efficient transport network for all modes of travel will be critical to unlock the full potential of Crossrail 2. In Broxbourne the main priorities are the delivery of Crossrail 2 and improving the capacity along the A10 and its junctions south of the Turnford interchange. Consideration will need to be given to connecting Crossrail 2 to the A10 and the M25 and associated key development sites and existing and proposed communities. In Waltham Cross this presents a particular challenge/ opportunity given that access from the station to the M25 is very problematic and convoluted even though it sits right next to the motorway; a more direct link solution could also address current congestion issues in Enfield.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Opportunities for increased benefits:

- Extend the northern terminus beyond Broxbourne Station
- Construct a new station between Cheshunt and Broxbourne at Turnford to support the creation of a new Borough Centre at Brookfield. Hertfordshire County Council and Broxbourne Borough Council are working together on a business case for the new station.
- Early delivery of four tracking of the West Anglia mainline north of Tottenham Hale to bring forward by a decade much needed new homes and employment opportunities for the region.
- Better connectivity between key strategic development sites and the existing and proposed railway infrastructure including, for example, the proposed commercial development at Park Plaza and the Southbury Loop railway line;
- Improve access to and reduce congestion around stations and improve links to A10 and M25

Opportunities for reducing costs:

- Comprehensive and regular consultations with all stakeholders, especially the key planning authorities and landowners , at each stage of the project
- Programme of level crossing closures to allow for the four-tracking of the West Anglia Main Line
- Reliable and up to date land surveys

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Possible funding opportunities:

- Recouping some of the uplift on land values from landowners via a Community Infrastructure Level approach
- Private sector contributions (via a form of Business Improvement District type model) as businesses will benefit from having such a major route on their doorstep
- Scope to align the work programme with the investment to make better use of resource and to drive more effective skills development

This needs to be underwritten nationally to create certainty which in itself will facilitate the investment via the mechanism mentioned above

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

Please refer to background paper below under 4)

BSA - The Business Services Association

Response to the National Infrastructure Commission Consultation

January 2016

Large-scale transport infrastructure improvements in London

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades.

According to Centre for Cities, between 2004-2013, London's population grew faster than any other of the UK's top ten metropolitan areas¹. The Greater London built-up area is nearly five times larger than the next largest of Greater Manchester. This means London has unique infrastructure pressures.

High house prices, coupled with population growth, will likely see more people move to the outskirts of London in search of cheaper dwellings. This development will necessitate improvements to suburban train lines such as Thameslink, Southern and Chiltern Railways in order to cope with increased demand along with a more positive and ambitious residential and mixed use development at and around local stations (both existing and planned). A limited amount of track space already hinders these often overcrowded services, a difficulty that will be exacerbated by a lack of investment and redevelopment.

This picture of steady, rapid growth means London's already strained transport network will face increasing pressure. Crossrail will add 10% capacity to the capital's rail network, however former TFL Commissioner, Sir Peter Hendy, has previously said that it will be 'immediately full' upon opening. This therefore suggests that a second major rail line is needed across London and the BSA welcomes proposals to explore the construction of Crossrail 2.

As with the first Crossrail, refurbished and increased station infrastructure will be a critical component of the project. Stations should be viewed as centres of their community, providing a basis for growth and development. New and improved stations with stable levels of investment can act as a catalyst for both housing and business development. In London especially, proximity to a train station is often a key consideration for someone looking to buy a home. Similarly easy access to transport links often affects a business' location decision. It is imperative that decision-makers take a whole community view of an individual project when judging its merits.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Crossrail 2, similar to the original Crossrail, offers London an opportunity to add significant capacity to its transport network. As previously mentioned, if Crossrail is full upon opening in 2018, the need for additional capacity will be immediate. The BSA would therefore encourage the development of the Crossrail 2 project as rapidly as is appropriate and necessary. Crossrail 2 will mean the East-West and North-South corridors of London will be served by a high-tech, far reaching and modern rail

¹ <http://www.centreforcities.org/wp-content/uploads/2015/01/15-01-09-Cities-Outlook-2015.pdf>

service. It also creates an opportunity to plan significant new housing above and around many of the proposed new stations which needs to be seen as an integral part of the Crossrail 2 project and not just an afterthought.

Additionally, the Commission should examine closely options for renovating and rebuilding parts of Euston station. As a key hub station, providing access to the North West and Midlands it is already overburdened and in need of investment. Factor in Euston's role as HS2's London hub and proximity to a proposed stop on the Crossrail 2 route and the need to substantially upgrade the station is clear.

Crossrail should not be the only means by which London seeks to expand its intra-city rail service. The capital has already seen new rolling stock introduced on the tube network, such as on the Metropolitan Line, Hammersmith and City Line and Victoria Line in recent years. A number of planned extensions will increase the reach of the tube network, helping create jobs. According to TFL, the Northern Line's Battersea extension will create 24,000 jobs and 18,000 new homes by 2020². The National Infrastructure Commission should explore the possibility of further tube extensions as London continues to grow both in terms of people and square miles. The business case for individual projects and investment, particularly the strategic and economic case, are key to working through prioritisation and economic impact. It is crucial that the business case is cross-agency, able to compare a range of transport and other infrastructure investment.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Starting construction on Crossrail 2 sooner will increase the benefits of job creation and adding capacity. The original Crossrail provides a bountiful source of construction workers, designers and engineers with much needed experience of building a brand new, cross-city, subterranean railway line. Lengthy delays in beginning construction risks this pool of workers dissipating and being committed to alternative projects. Government must offer assurance and clarity as to whether and when Crossrail 2 will be built. As soon as this is offered, businesses can begin the necessary training and upskilling of workers needed to deliver the project.

The BSA urges the government to recognise the benefits of allowing for a seamless transition between major infrastructure projects. Crossrail and Crossrail 2 are an obvious example, being in the same geographical location, requiring the same equipment and demanding the same skills. The National Infrastructure Plan for Skills estimates a shortfall of nearly 400,000 construction and engineering jobs by 2020³. A lack of seamless transition between projects will exacerbate the problem.

The option of phased implementation should be looked at, which could mean that some of the Crossrail 2 infrastructure is not only built, but in operation ahead of 2028. This could allow for increasing London's transport capacity gradually and earlier than if the line was opened all at once. Particular attention should also be paid to development at key nodal points, where a number of major train lines will meet. This in turn should create 'spin-off' regeneration opportunities for housing and businesses to develop in these nodal points where they otherwise wouldn't have.

³ https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/464354/NIP_for_skills_final_web.pdf

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Tax Increment Financing (TIF) offers a particularly beneficial structure for funding large-scale transport infrastructure improvements in the capital. This is due to the relatively high-concentration of businesses, particularly around Central London. TIF works by dedicating a proportion of future tax revenues (normally business rates in the case of the UK) for infrastructure and development. The improved connectivity derived from such projects would usually see an increase in business rate revenue, providing a viable option for funding large-scale transport infrastructure. However, given that councils will soon be allowed to keep a portion of their business rate revenues, it will require coordination across all of London's boroughs.

In addition, opportunities for significant residential development at and around new stations and transport interchanges creates an opportunity to secure a mix of capital receipts and new revenue streams to support new transport investment.

As raised in the 2015 Autumn Statement and Spending Review, the pooling of local government pensions funds offers a potentially significant source of funding for infrastructure investment. Pooling the pension funds of London's local authorities, as well as possibly including other bodies such as Transport for London, will allow a greater single pot of investment. Pension funds have the advantage of being able to invest in projects which look longer-term. Infrastructure investment is ideal for pension funds as it offers very low risk due to being underwritten by the government and delivering steady, long-term returns.

In order to support the effective delivery of large-scale transport infrastructure, it is important that an ambitious but realistic time-frame for completion is put in place. A recent National Audit Office report said a project with lengthy timescales negatively affect the continuity, whilst short timescales can make delivery a virtual impossibility⁴.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied?

BSA members have experience of constructing major infrastructure projects across the globe, including, but not limited to, Canada, U.S.A. and Dubai. As with the UK, stability is key to the success of any infrastructure programme, with constructors reliant on the assurance that long-term projects will remain funded and immune from sudden changes or cancellations.

Singapore and Hong-Kong, as major, densely packed metropolises with high demand for transport infrastructure have taken the approach of 'upwards not outwards'. Given the limits on space that exist in both cities, particularly Hong-Kong, projects are being proposed and implemented that will see transport systems make use of space above the city rather than spreading outwards.

LONDON'S TRANSPORT INFRASTRUCTURE

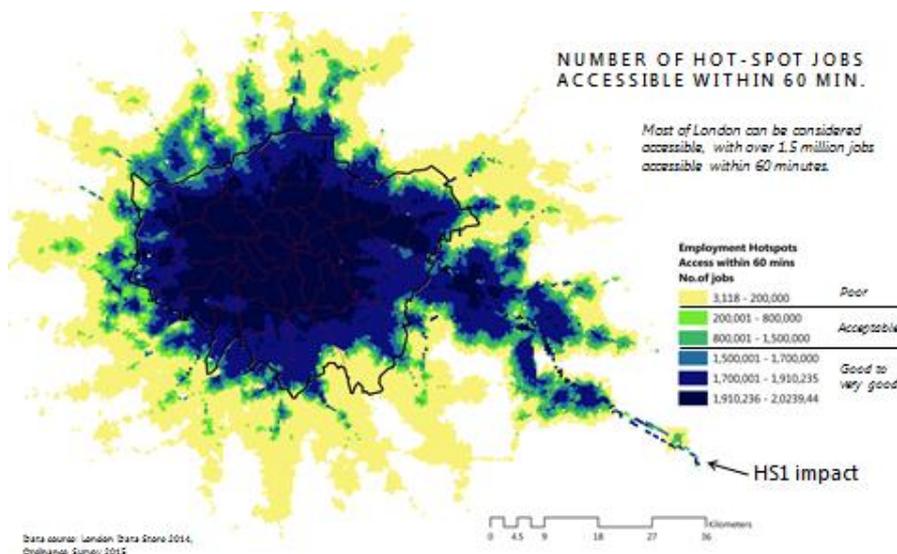

RESPONSE TO NIC CALL FOR EVIDENCE

JANUARY 2016

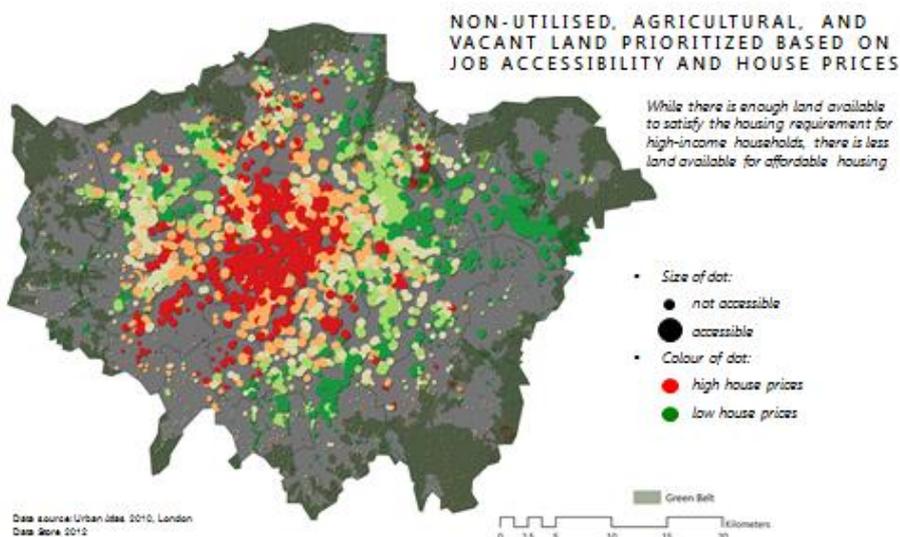

Accessibility to Employment

Current transport accessibility to London employment areas could be considered good for much of the capital, with most areas reachable by current and planned transport infrastructure within 60 minutes.

It should be noted on the diagram adjacent how HS1 and the Javelin services from Kent have had a strong impact on extending job accessibility.

Land Availability

London has a good supply of non-utilised, vacant and agricultural land that could be made available for housing. Much of it is blessed with reasonable (existing or planned) transport connectivity to employment.

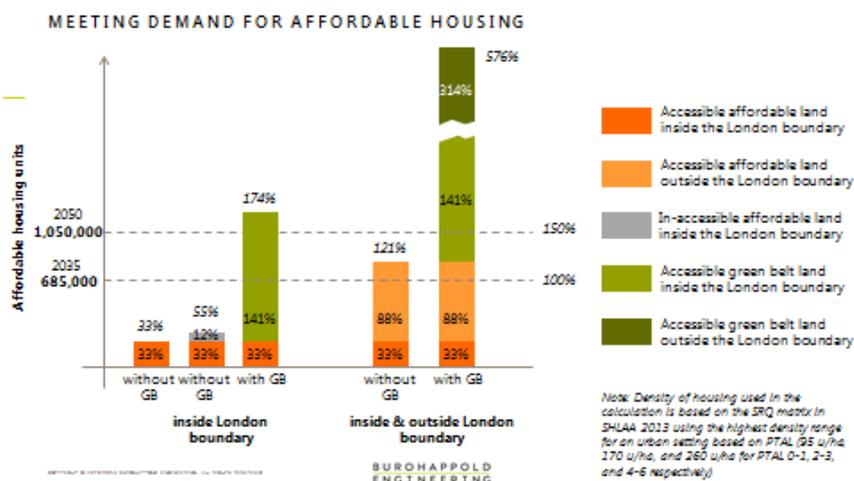

However, high land prices, particularly of sites close to the centre of the city, excludes many of these areas from being suitable for the development of housing that is affordable for those on anything other than

very high salaries or with significant funds to invest.

Meeting the Demand for Affordable Housing

Our modelling has identified the areas that are available for development, accessible to jobs via current and planned transport infrastructure (including Crossrail), and (crucially) affordable.

However, even if fully developed, this land will only meet 33% of the forecast needs for 2035. [NB Our calculations are based on the SRQ matrix in SHLAA 2013, using the highest density range for an urban setting].

Consequently, other options need to be considered if London's competitiveness and position as an economic powerhouse is not going to be compromised.

Examining other parcels of land within the London boundary, a further 12% of needs could be met - if they could be made more accessible to employment by improvements to the transport network.

We have also identified accessible affordable land outside London's boundary that, if made available for homes, could meet the housing needs of the City for the next 20 years. Looking further ahead to 2050, one could consider the transfer of a small amount of accessible greenbelt land for housing needs and this would enable London to accommodate, in an affordable fashion, all of its forecast population demands.

Although releasing greenbelt land is considered a tough political step to take, we believe it could be mitigated by creating equal or greater areas of amenity land within the London boundary (and elsewhere). This could be achieved either by remediating challenging brown-field sites or utilising sites which are likely to remain inaccessible through lack of good transport connectivity.

In summary, we see two key areas to focus on in order for London to continue as a world-leading city, namely:

1. Improvements to transport infrastructure particular linking affordable, available land with employment areas
2. Some future use of green belt land already accessible to major transport routes from central London, mitigated by land swaps to maintain areas of amenity.

We see Crossrail 2 and Cross City Connect – see later – falling into the first category.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2?

BuroHappold Engineering has invested significant time and resources to the examination of infrastructure improvements for London in two key areas:

1. An alternative to the London end of HS2 that will deliver much greater benefit, in terms of inter-regional connectivity, economic regeneration, vital additional capacity and network resilience, whilst requiring **no additional investment cost** than that forecast for the full delivery of the current terminus at Euston.
2. The use of low level bridges to unlock key development sites in East London – with particular emphasis on the priority development area known as 'City in the East'

A. Cross City Connect

The current proposals for linking the planned HS2 rail route into London represent a missed opportunity. This could be the foundation of an effective and integrated modern railway network for the UK. What's more, the proposed terminus station development at Euston not only delivers poor economic returns, but will become ever-more costly and difficult to deliver.

Working with tunnelling experts OTB, BuroHappold Engineering is promoting an alternative route which links with HS2 in the west of London, crosses the city in tunnel and links with HS1 in the east of London. Our Cross City Connect proposal has a single major rail interchange at Waterloo/ Southwark/ Blackfriars with substantially better onward connections into London as well as providing seamless access to Europe.

We have sought to address all of the major issues facing the current proposals for the HS2 terminus at Euston, and fulfil the original intent of HS2 project.

It is important that HS2 hits its ambitious timetable. With the right level of support and decisive commitment, it will be possible to deliver Cross City Connect by 2026 – the current timetable for the partial terminal at Euston promoted by HS2 Ltd. It is certainly possible to deliver the full scheme in advance of HS2 Phase 2 in 2033. From a timing standpoint, this will also enable additional demand to be met at a point when the current Crossrail route nears capacity.

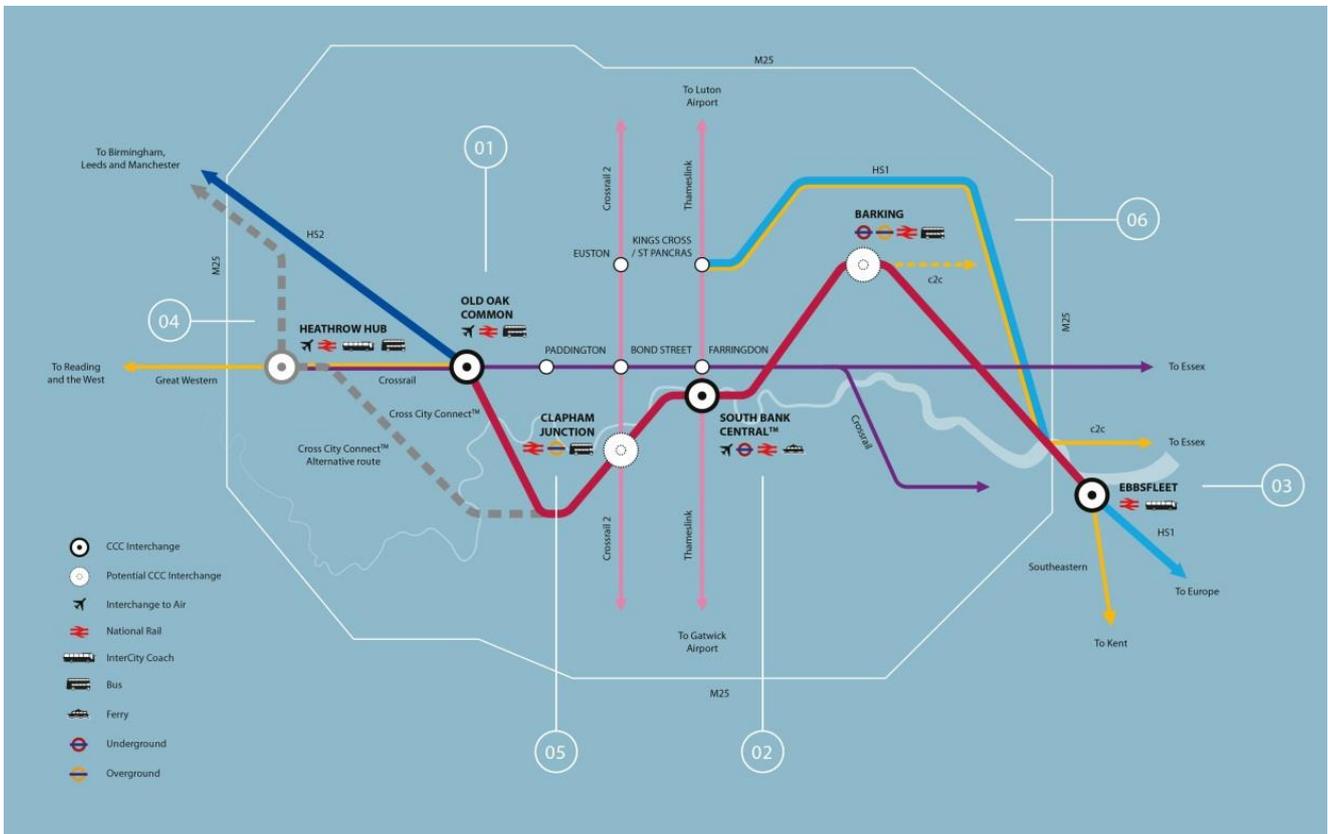

Euston HS2 major issues:

- **Delivery challenges:** Euston requires a massive land-take on a constrained and complex operational site. Adding eleven new HS2 platforms to the challenges of upgrading the underground station, delivering Crossrail 2, and regenerating the local area is a step too far.
- **Spiralling costs:** Land acquisition and construction estimates for the completion of the Euston terminal, from various sources, has risen from the original budget of £1bn to between £4bn and £7bn. Even the current partial build-out proposals tabled are acknowledged to cost well over £2bn –without including the costs of land acquisition nor the work required by others to complete the build-out.
- **London disruption:** Over two decades of misery for those living and working around the area and for commuters using the regional line into the existing station.
- **Connectivity:** Key link to HS1 has been dropped – removing the direct international link and also inter-regional connectivity.
- **Wasted regeneration boost:** To counter rising costs, significant over-site development is planned. Yet Euston is already benefitting from the regeneration around Kings Cross and may gain the benefit of a future Crossrail 2 station. The incremental value delivered by HS2 will be marginal.

The Cross City Connect Solution

We have taken a fresh look at some of the original aims of the HS2 project and drawn on our international experience and upon best-practice in urban infrastructure. Our solution, Cross City Connect (CCC), traverses London in tunnel construction from a link with HS2 in the West to Ebbsfleet Station in the East. It links directly to Europe via HS1, and connects regional services from Essex and Kent to the Thames Valley, the West, Midlands and the North. There will be a new central London hub on the South Bank beneath and between Waterloo and Southwark. It has the capacity to include additional interchanges to enhance regional connectivity and unlock much-needed growth areas.

Working closely with tunnelling specialists OTB, we have defined a route that is **deliverable for no more than the cost of the full delivery of Euston, within current HS2 programme timeframes.**

01 Western Hub - OLD OAK COMMON Option

Our proposal sees Old Oak Common become the western station for the CCC underground rail route.

- Key London HS2 station with connections to Crossrail and Great Western Mainline.
- Further boost to the area's massive regeneration potential
- The opportunity to create an interim terminus for HS2 Phase 1, allowing time for the delivery of a better solution ahead of Phase 2.
- Options to provide additional connectivity to the Bakerloo Line and to overground services at Willesden Junction. (See later section for more information)

02 Central London Interchange - SOUTH BANK CENTRAL™

A new central station that sits beneath and between four existing stations in the heart of London. Initial investigations demonstrate that this is a viable and economically beneficial option.

- Significant benefits in terms of connectivity, network capacity and resilience.
- Provides walking access to Central London.
- Links to 5 underground lines, Thameslink and overground services to the southeast and southwest.
- More efficient dispersal at Waterloo, Southwark / Blackfriars.
- Regeneration boost to the South Bank, and to the Elephant & Castle and Vauxhall Nine Elms opportunity areas.

03 Eastern Hub - EBBSFLEET

Coming to the surface near Rainham, where there is space to service and turn around trains, our route travels to the existing HS1 station at Ebbsfleet as a gateway to both international and inter-regional services.

- Connection to existing HS1 services to Europe.
- Inter-regional trains linking the Thames Valley and the West to Kent (Javelin) and Essex (c2c).
- Boost to the embryonic Ebbsfleet Garden City.
- Ease of access to M25 and other regional motorways.

04-06 Potential CCC Interchanges

Cross City Connect has been designed to enable significant future connectivity and regeneration to be delivered cost-effectively:

- **West London linkage option at HEATHROW HUB:** Depending on the final decision on the location of the future southeast airport, there is also an option to link directly to a new transport hub and employment site at Heathrow. Heathrow Hub could provide a direct rail link to this major international gateway for the south-west, midlands, north and south-east via HS2, GWML, Crossrail and Cross City Connect, as well as easy access from the motorway network. This also has the advantage of space that is more easily developable than Old Oak Common, whose ambitious development plans are complicated by the large amount of live rail infrastructure, including the construction of a new Crossrail Depot.
- **CLAPHAM JUNCTION:** There is the option for an interchange with Crossrail 2 and the many overground services to South London and beyond.
- **BARKING:** There is the potential for a future station to provide impetus to The City in the East area to support London's projected growth.

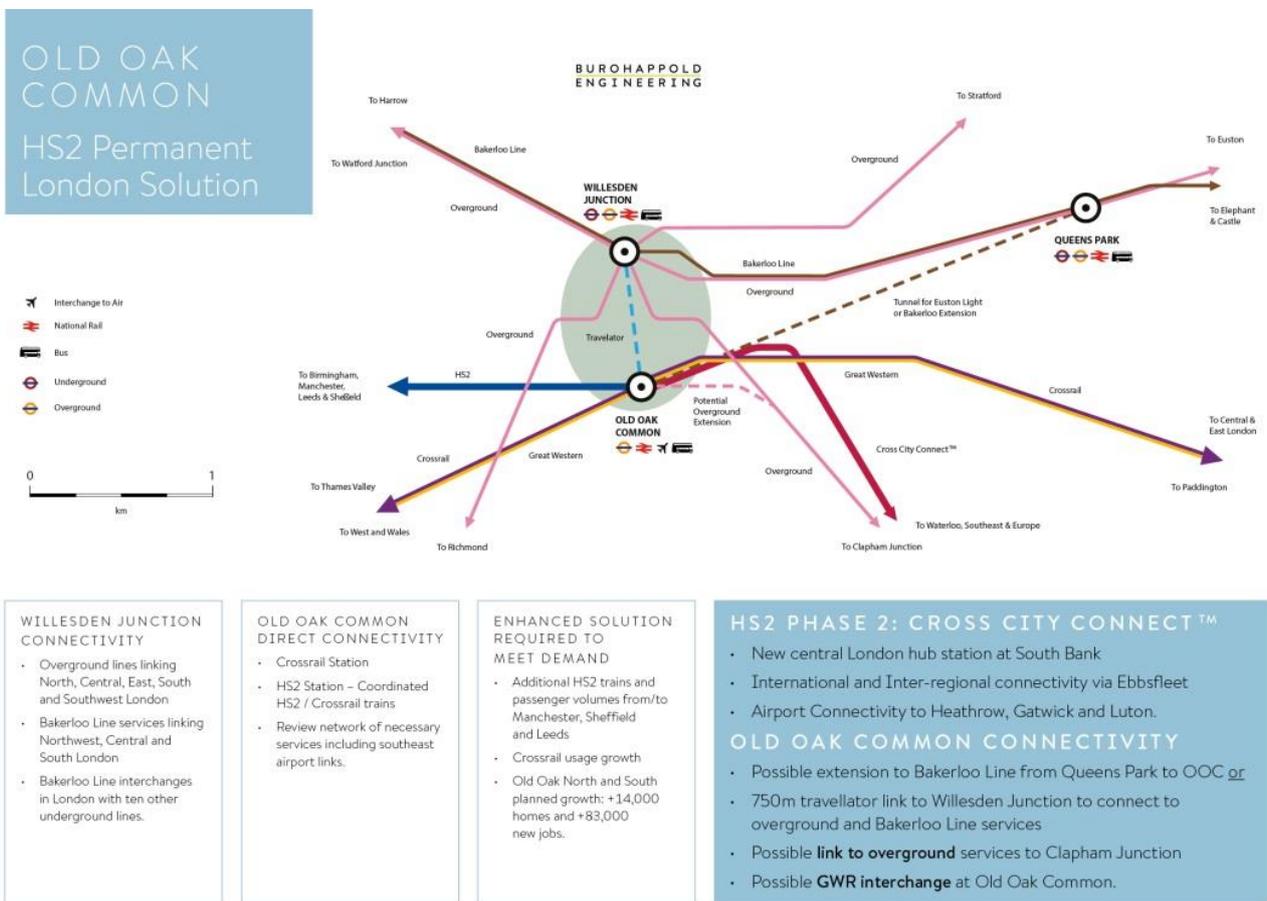

MEETING HS2 PROGRAMME TARGETS

It is important that HS2 hits its ambitious programme milestones. We are advocating a two-phase solution, that aligns exactly with the HS2 programme with an interim terminus at Old Oak Common for HS2 Phase 1, with the full Cross City Connect route open in time ahead of the opening of HS2 Phase 2 in 2033.

A Temporary Terminus at Old Oak Common

Old Oak Common presents a viable *interim* solution for the first phase of HS2:

- HS2 passengers transfer to a waiting Crossrail train for onward transfer to central and eastern London. Passengers can also travel west on Crossrail to Heathrow and the Thames Valley
- Turnaround of HS2 trains using the six HS2 platforms, supplemented by the first section of the CCC tunnel
- Options for increased connectivity via a traveller link to Willesden Junction, or an extension to the Bakerloo Line at Queens Park

Why Old Oak Common won't work as a permanent HS2 Terminus

By the opening of HS2 Phase 2, a new solution will be required to cope with significant additional volumes:

- HS2 passengers travelling to and from Manchester, Sheffield and Leeds.
- Crossrail will experience increased usage from residential and job growth along its route.
- The development of Old Oak Common North and South is predicted to add up to 14,000 homes and bring 80,000 jobs to the area.
- London's population is forecast to increase by close to 2 million additional residents by 2030.

By 2030, Cross City Connect will be ready to carry passengers to its central London interchange and on to Ebbsfleet with connection to HS1 and regional services to Essex and Kent.

Potential impact of Cross City Connect on employment, productivity and housing supply in London and the southeast?

Connectivity, capacity and resilience:

- Greater UK **regional connectivity**, from the northwest, northeast and Midlands to London, and to the southeast and southwest, slashing travel times and giving direct access to new markets.
- **Reduced traffic** volumes on the M25 and the wider southeast motorway network, increasing the efficiency of many business trips and commercial logistics.
- Broader and more **efficient dispersal** at Waterloo / Southwark / Blackfriars with more **effective access** to other services.
- **Reduced pressure on Crossrail** long term via our additional east-west route.
- Direct rail links between our regional cities and key **international transport gateways** via CCC interchanges, providing more efficient access to overseas markets.

Development and regeneration:

- Access to a larger labour pool supports the **enlargement of the London Economic Area**.
- **Supports trends** for flexible working, access to affordable housing and quality of life drivers.
- South Bank Central will **unlock the potential economic value** of the area around **Waterloo and Blackfriars** - A possible southern extension to The City's business and financial services district.
- A significant boost to the key regeneration sites at **Elephant & Castle, Vauxhall and Nine Elms**.
- Possible future station in Barking to drive **regeneration in the Thames Gateway**, providing vital access to employment opportunities and unlocking wider housing plans to the east of London.
- Euston Station and surrounding area can **be redeveloped with nearby Kings Cross** in a structured way without HS2 complexity.

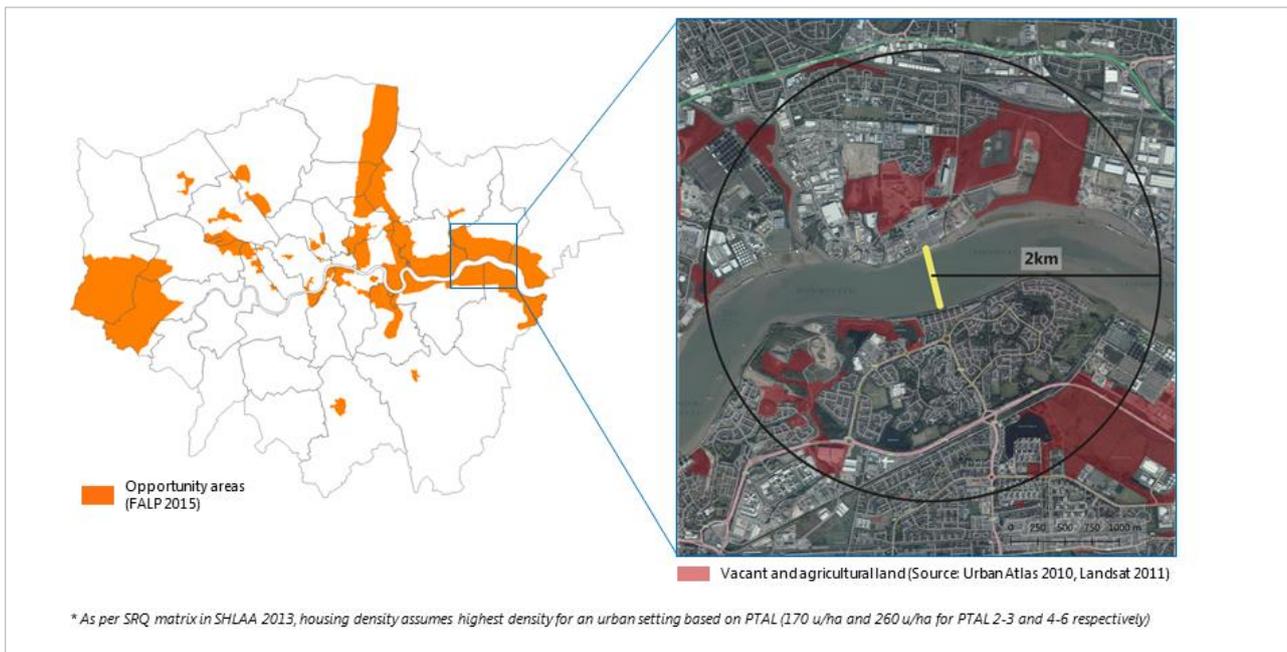

Cost Certainty and Minimal Disruption

- Tunnelling beneath London, following existing rail corridors **manages risk** more efficiently.
- **Through-running** at South Bank Central avoids the need for eleven platforms at Euston's terminus.
- Subterranean stations **minimise land-take** and provide greater opportunity for valuable Over-Site Development. And create significantly lower disruption to working London during construction.
- **Delayed expenditure** of significant public funds to the second phase of the HS2 programme.

B. Low Level Bridges in East London

Working with urban designers Farrells, we have identified how low level bridges will help unlock land for housing development and improve job accessibility for existing and future communities in East London.

As an example, our analysis has shown that within a 2km radius of a potential bridge connecting Thamesmead with Barking Riverside almost 50,000 new homes could be built. A bus connection over the bridge would link Abbey Wood Crossrail Station in the south with the future Barking Riverside overground station in the north and increase job accessibility. It will increase transport network resilience and also enhance access to London's waterfront for the benefit of local residents.

Initial findings have been shared with TfL and the Port of London Authority. More information on our recommendations can be found in a separate BuroHappold / Farrells NIC submission.

How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

There is an absolute need for the current Green Book methodology for the evaluation of transport infrastructure to be thoroughly revised to take into account the full range of benefits – and also to recognise value-destroyers that major transport infrastructure can represent for an area.

As was highlighted by the HS2 Growth Taskforce, and referenced in the NIC Terms of Reference, a major transport infrastructure investment delivers far greater benefits than greater capacity, reliability and faster journey times; In addition to connecting organisations to new markets, connecting jobs and labour drives significant economic value, and the role of interchanges as anchors of local regeneration has been clearly demonstrated in the case of Kings Cross St Pancras. Full business cases need to be created for all major investments, that enable far greater transparency in prioritisation and decision-making.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The currently proposed Crossrail 2 tunnel alignment focuses on locations where there is already substantial development (such as Chelsea and Victoria) and where regeneration is already in progress (such as the Euston Cross area). An alignment that runs further east in the city centre, both south and north of the river, would deliver far greater above station and area wide regeneration benefits. Furthermore, greater consideration should be given to locating underground stations for the tunnel section on alignments which give access to several existing stations. Assuming a route further South, an example might be a station between and linking Elephant and Castle Tube and Surface Rail stations.

To the east and north of the Thames one could consider something which links and integrates Tower Hill Tube, Tower Gateway DLR, and Fenchurch St stations. In this way, the new station can both enhance integration between existing services by creating mega hub stations, and spread over-station redevelopment opportunities over a much larger area. The benefits of such strategies would be considerable. Furthermore, whilst the costs of additional access and egress points might be slightly higher, these would be more than off-set by the reduced costs and disturbance at the existing interchange stations due to a more even distribution of interchange passenger loads, reducing the scale of works to increase local capacity.

4. What are the options for the funding, financing and delivery of large-scale infrastructure improvements in London, including Crossrail 2?

In terms of "Financing", recent major tunnelling projects in London, including Crossrail and the Thames Tideway Tunnel, along with developments in infrastructure financing in Canada, have in our view shown the way forward. Crossrail shows that construction risk, when going underground, is not as great as thought. Indeed, it can now be argued that staying at the surface is far more risky than going underground. Expected return from investors directly correlates to risk. We have seen with Thames Tideway that cost of capital on large tunnelling projects need not be excessively high. What is more, we have a growing pool of funds held by pensions. In Canada this has been mobilised to deliver much needed infrastructure via the major pension investment funds. Pension funds are the perfect vehicle for infrastructure funding of this type, not only creating stable long term returns for those depending on the pensions, but ensuring that contributions made today are being mobilised for the benefit of those making those contributions. A rare win:win.

With such a privately financed structure, one can move to "Delivery" via a public private project company model. If correctly structured in terms of risk allocation, this can deliver significant benefits in terms of ongoing innovation and whole life costing disciplines, while ensuring appropriate controls are retained within the public sector, thus ensuring a company that focuses on its specific business, yet operates within a structure that considers wider social and economic issues.

- What is an appropriate local and regional contribution – given the potential distribution of benefits to business, residents, transport users and the wider economy – and how could this be achieved?

It is clear that investment in transport infrastructure has wide and decisive regional catalytic impacts, enabling residents of both London and the peripheral commuting counties in the South East and Eastern Regions to access employment opportunities in the Greater London area. For example, it is clear that Crossrail 1 will deliver significant economic benefit to the commuting residents of Berkshire, Essex. What's more, if the proposed diversion of western Crossrail services to the WCML goes ahead, Bedfordshire, Hertfordshire and Buckinghamshire residents will also benefit, largely at the expense of London business ratepayers. One could also argue that as workers continue to move further out of London to find homes they can afford, such upfront match investment in transport infrastructure is essential if large employers in central London are to access one of the world's most cosmopolitan, diverse and skilled workforces – due to the many reasons cited in the call for evidence.

Therefore, we recommend that the South East and Eastern Regions are given utmost consideration when contemplating further infrastructure investment in London. As co-beneficiaries, and potential co-funders, of such infrastructure it is

important that their role is recognised in helping London deliver its strategic goals of affordable family housing and a competitive labour supply.

While we understand that there are fora for such engagement in decision making already in place, we think that their role and powers will need to be reviewed given the challenges faced. For example, many of the newly announced City Regions designated as part of the 'Northern Hub' policy constitute an urban city plus the peripheral and commuter hinterland in which significant parts of the labour market reside. These City regions will be given significant powers over infrastructure investment and service level agreements that London does not have over activities in the South East and Eastern Region. This presents a potential comparative disadvantage for London in the planning and funding of such infrastructure.

What is clear is that existing funding models will be insufficient for continued investment of the scale London has witnessed in the last few years. While the Crossrail 1 funding model has been lauded as particularly successful in enabling government to recoup some of the costs from beneficiaries in central London (employers and developers), the next stage will require this pool of beneficiaries to be enlarged further, given the scale of investment required. So, who are these potential additional beneficiaries? The Crossrail 1 experience has shown that they include a far more varied and geographically wider group than initially assumed: residents and employers in outlying commuter counties; speculative buy to let landlords near proposed stations; developers both in London and in outlying commuter areas; and property in London near stations who have seen phenomenally capital gains since the project's route was first announced.

There is an ever-increasing suite of mechanisms available to local authorities to capture value generation from new development – s106, CIL, TIF, and Incremental Business Rates. However, these do not work well when dealing with intra-regional infrastructure developments, such as the proposed Crossrail 2 and other infrastructure benefiting the capital's economic hinterland, or in capturing any capital gains. We recommend that further research is commissioned to investigate the innovative options available to London to both capture some of this capital wealth generation (potentially building on the recently published work of the Centre for Cities "*Beyond Business Rates: Incentivising cities to grow*") and also ensuring enhanced contribution from beneficiary counties on London's periphery.

The new profusion of Local Enterprises Partnerships is, for example, one way that London could seek to ensure that the funding of infrastructure is fair to all beneficiaries – as shown recently by the Hertfordshire LEP's funding contribution to the Metropolitan Underground works at Watford. We should recognise, however, that such arrangements will lead to local calls from the counties for greater scrutiny over such spending decisions, with a widely held assumption that transport services are often skewed in favour of the capital's requirements over these commuting counties. Such discussion over service level agreements and operations is best at the regional level, potentially using the regional fora discussed earlier.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

- Construction of rail stations underground is now well-established – eg The recent underground Magenta station in Paris between Paris Nord and Paris Est stations.
- Terminus stations in cities have been rejected in favour of through stations in a number of major European cities including Berlin, Vienna, Stuttgart and Marseilles.....and historically in Brussels, the old north and south stations were connected to make a through line.
- The 7 Line Subway Extension in New York is being funded with NYC funds from bond sales to be repaid with property tax revenues from development in the area around the new station (the Hudson Yards). Other transport projects in the US are similarly financed (e.g. Atlanta's Belt Line)..
- Hong Kong's MTR are developing real estate and transport themselves.
- BRT as a potential 'cheaper' option to connect areas of London that are poorly served by public transport. New York serves as a good example of how they are trying to upgrade their bus network to areas that are less served.

LONDON'S TRANSPORT INFRASTRUCTURE:
RESPONSE TO NIC CALL FOR EVIDENCE

CO N T A C T

Andrew Comer, Partner

BSA - The Business Services Association

Response to the National Infrastructure Commission Consultation

January 2016

Large-scale transport infrastructure improvements in London

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades.

According to Centre for Cities, between 2004-2013, London's population grew faster than any other of the UK's top ten metropolitan areas¹. The Greater London built-up area is nearly five times larger than the next largest of Greater Manchester. This means London has unique infrastructure pressures.

High house prices, coupled with population growth, will likely see more people move to the outskirts of London in search of cheaper dwellings. This development will necessitate improvements to suburban train lines such as Thameslink, Southern and Chiltern Railways in order to cope with increased demand along with a more positive and ambitious residential and mixed use development at and around local stations (both existing and planned). A limited amount of track space already hinders these often overcrowded services, a difficulty that will be exacerbated by a lack of investment and redevelopment.

This picture of steady, rapid growth means London's already strained transport network will face increasing pressure. Crossrail will add 10% capacity to the capital's rail network, however former TFL Commissioner, Sir Peter Hendy, has previously said that it will be 'immediately full' upon opening. This therefore suggests that a second major rail line is needed across London and the BSA welcomes proposals to explore the construction of Crossrail 2.

As with the first Crossrail, refurbished and increased station infrastructure will be a critical component of the project. Stations should be viewed as centres of their community, providing a basis for growth and development. New and improved stations with stable levels of investment can act as a catalyst for both housing and business development. In London especially, proximity to a train station is often a key consideration for someone looking to buy a home. Similarly easy access to transport links often affects a business' location decision. It is imperative that decision-makers take a whole community view of an individual project when judging its merits.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Crossrail 2, similar to the original Crossrail, offers London an opportunity to add significant capacity to its transport network. As previously mentioned, if Crossrail is full upon opening in 2018, the need for additional capacity will be immediate. The BSA would therefore encourage the development of the Crossrail 2 project as rapidly as is appropriate and necessary. Crossrail 2 will mean the East-West and North-South corridors of London will be served by a high-tech, far reaching and modern rail

¹ <http://www.centreforcities.org/wp-content/uploads/2015/01/15-01-09-Cities-Outlook-2015.pdf>

service. It also creates an opportunity to plan significant new housing above and around many of the proposed new stations which needs to be seen as an integral part of the Crossrail 2 project and not just an afterthought.

Additionally, the Commission should examine closely options for renovating and rebuilding parts of Euston station. As a key hub station, providing access to the North West and Midlands it is already overburdened and in need of investment. Factor in Euston's role as HS2's London hub and proximity to a proposed stop on the Crossrail 2 route and the need to substantially upgrade the station is clear.

Crossrail should not be the only means by which London seeks to expand its intra-city rail service. The capital has already seen new rolling stock introduced on the tube network, such as on the Metropolitan Line, Hammersmith and City Line and Victoria Line in recent years. A number of planned extensions will increase the reach of the tube network, helping create jobs. According to TFL, the Northern Line's Battersea extension will create 24,000 jobs and 18,000 new homes by 2020². The National Infrastructure Commission should explore the possibility of further tube extensions as London continues to grow both in terms of people and square miles. The business case for individual projects and investment, particularly the strategic and economic case, are key to working through prioritisation and economic impact. It is crucial that the business case is cross-agency, able to compare a range of transport and other infrastructure investment.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Starting construction on Crossrail 2 sooner will increase the benefits of job creation and adding capacity. The original Crossrail provides a bountiful source of construction workers, designers and engineers with much needed experience of building a brand new, cross-city, subterranean railway line. Lengthy delays in beginning construction risks this pool of workers dissipating and being committed to alternative projects. Government must offer assurance and clarity as to whether and when Crossrail 2 will be built. As soon as this is offered, businesses can begin the necessary training and upskilling of workers needed to deliver the project.

The BSA urges the government to recognise the benefits of allowing for a seamless transition between major infrastructure projects. Crossrail and Crossrail 2 are an obvious example, being in the same geographical location, requiring the same equipment and demanding the same skills. The National Infrastructure Plan for Skills estimates a shortfall of nearly 400,000 construction and engineering jobs by 2020³. A lack of seamless transition between projects will exacerbate the problem.

The option of phased implementation should be looked at, which could mean that some of the Crossrail 2 infrastructure is not only built, but in operation ahead of 2028. This could allow for increasing London's transport capacity gradually and earlier than if the line was opened all at once. Particular attention should also be paid to development at key nodal points, where a number of major train lines will meet. This in turn should create 'spin-off' regeneration opportunities for housing and businesses to develop in these nodal points where they otherwise wouldn't have.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Tax Increment Financing (TIF) offers a particularly beneficial structure for funding large-scale transport infrastructure improvements in the capital. This is due to the relatively high-concentration of businesses, particularly around Central London. TIF works by dedicating a proportion of future tax revenues (normally business rates in the case of the UK) for infrastructure and development. The improved connectivity derived from such projects would usually see an increase in business rate revenue, providing a viable option for funding large-scale transport infrastructure. However, given that councils will soon be allowed to keep a portion of their business rate revenues, it will require coordination across all of London's boroughs.

In addition, opportunities for significant residential development at and around new stations and transport interchanges creates an opportunity to secure a mix of capital receipts and new revenue streams to support new transport investment.

As raised in the 2015 Autumn Statement and Spending Review, the pooling of local government pensions funds offers a potentially significant source of funding for infrastructure investment. Pooling the pension funds of London's local authorities, as well as possibly including other bodies such as Transport for London, will allow a greater single pot of investment. Pension funds have the advantage of being able to invest in projects which look longer-term. Infrastructure investment is ideal for pension funds as it offers very low risk due to being underwritten by the government and delivering steady, long-term returns.

In order to support the effective delivery of large-scale transport infrastructure, it is important that an ambitious but realistic time-frame for completion is put in place. A recent National Audit Office report said a project with lengthy timescales negatively affect the continuity, whilst short timescales can make delivery a virtual impossibility⁴.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied?

BSA members have experience of constructing major infrastructure projects across the globe, including, but not limited to, Canada, U.S.A. and Dubai. As with the UK, stability is key to the success of any infrastructure programme, with constructors reliant on the assurance that long-term projects will remain funded and immune from sudden changes or cancellations.

Singapore and Hong-Kong, as major, densely packed metropolises with high demand for transport infrastructure have taken the approach of 'upwards not outwards'. Given the limits on space that exist in both cities, particularly Hong-Kong, projects are being proposed and implemented that will see transport systems make use of space above the city rather than spreading outwards.

Large-scale transport infrastructure improvements in London

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London is likely to continue to face issues associated with accommodating increasing population and in-commuting. Important among these will be the issue of air pollution.

Transport for London has reported that the number of trips made in London in 2013 averaged 26.1 million per day, an increase of 1.2 per cent over the previous year (including residents and non-residents).

Within this, there are a number of important trends. Over the 10-year period from 2003-2013, total trips increased by 11.4 per cent, with rail increasing by 52.3 per cent, Underground /DLR by 32 per cent and cycling by 53.9 per cent. By contrast, car driver trips decreased by 12.7 per cent over the same period. [<http://content.tfl.gov.uk/travel-in-london-report-7.pdf>]

Despite the fall in car numbers, legal compliance with air quality limits remains a very significant problem. The national Air Quality Strategy, published by DEFRA in 2015 [https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/486636/aq-plan-2015-overview-document.pdf] reports that the Greater London urban area currently has the highest NO₂ exceedance in the UK and that the capital's transport networks and construction activity means the task of reducing NO_x emissions, and NO₂ concentrations, is the most challenging in the country.

The London Mayor is taking forward a package of measures to bring London into compliance with NO₂ limit levels in the shortest possible time. This includes reducing emissions from buses and taxis, and introducing an Ultra Low Emissions Zone from 2020. Despite these initiatives, air quality is not expected to be compliant with legal standards before 2025.

In sum, new transport infrastructure and initiatives will be needed to move increasing numbers of people around greater London while actively reducing air pollution and its impact on human health. Increased demand for rail, Underground and cycling together with a marked fall in car driving all have the potential to help achieve this goal.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

It is vital that investment priorities are clearly aligned with wider policy objectives and legal requirements. In keeping with our response to Q1, potential schemes should be prioritised with clear regard to legal responsibility concerned air quality and long term trends away from car use and toward public transport. In this regard, we are concerned by plans for further Thames crossing schemes based on road transport which stand to break positive trends away from car reliance and increase local air pollution concerns. More detail is given in our response to the river crossings consultation in 2014

[http://bettertransport.org.uk/sites/default/files/research-files/CfBT_TfL_River_Crossings_Consultation_Sep2014_FINAL.pdf].

Open Consultation

National Infrastructure Commission call for evidence

London's transport infrastructure

The National Infrastructure Commission is a new, independent body which will look at long term infrastructure needs and provide impartial advice to ministers and Parliament. Before next year's budget they will publish a report on *large scale transport infrastructure improvements in London*.

You are strongly encouraged to provide details of the evidence and data to support your arguments to enable the Commission to understand more fully the basis on which conclusions have been reached.

Please note, the Commission will not be considering questions relating to airport capacity. The Airports Commission has already examined this issue in detail.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

<p><u>Reduce journey numbers</u></p>

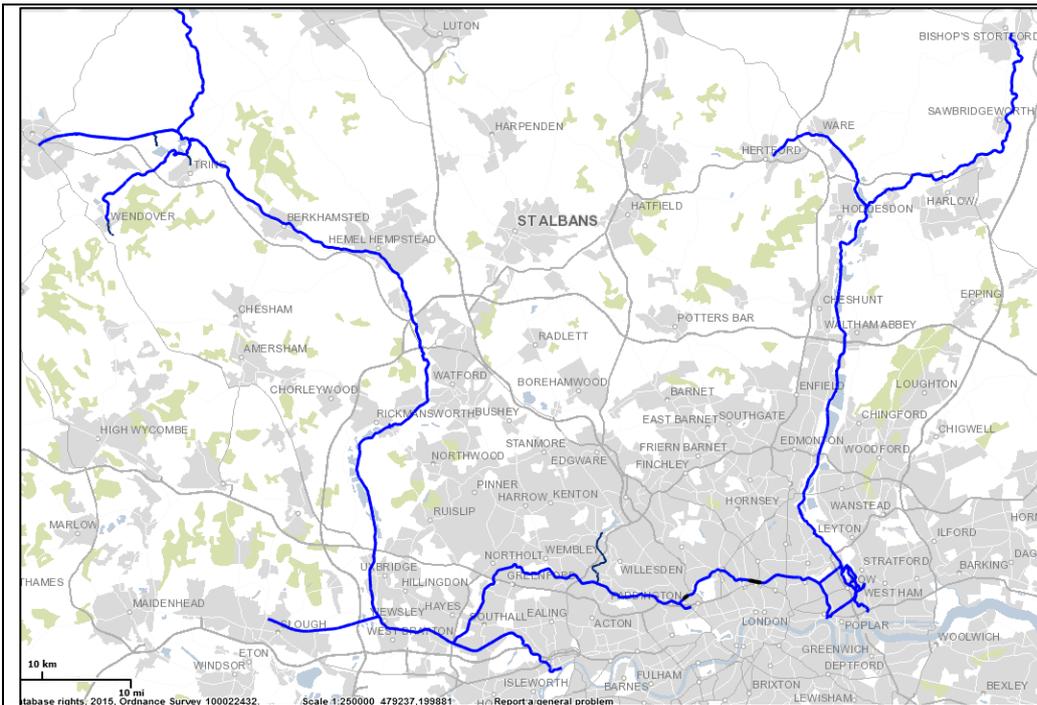

<p>What further measures can be taken to better integrate land uses (residential, employment, education, health etc) to reduce the need to travel, including use of technology and flexible working.</p>
--

<p><u>Cycle-friendly public transport</u></p>

<p>Consider further how trains and buses can better accommodate carriage of bikes as a means of continuing journeys with a view to relieving peak pressures on rail and road.</p>

<p><u>Sustainable Travel</u></p>

<p>Canal and river towpaths offer attractive traffic-free routes for people to travel to work, school and for leisure. Canal & River Trust's has around 100 miles of waterways and towpaths in the Capital and surrounding areas, including around 65 miles within the fifteen London boroughs north of the Thames. These waterways connect the Lee Valley, Central London and the West (see map below)</p>

The Trust's Waterways in the London Area

Waterways support London's growth, connecting people to key employment, opportunity and visitor destinations such as:

- London Docklands
- Meridian Water Enfield
- Tottenham Hale
- Stratford and the Queen Elizabeth Olympic Park
- Kings Cross
- Paddington Basin / Little Venice
- Old Oak Common & Park Royal MDC
- Southall Gas Works
- Crossrail western extension – Hanwell, Southall, Hayes, West Drayton, Iver, Langley, Slough

Cleaner Air for London

Along with other measures, towpaths contribute to reducing vehicular congestion and air pollution within London. For example, the Environmental Audit Committee's Action on Air Quality Report mentions a broader role for LEPs and Regional Growth Funds to achieve cleaner air quality alongside their jobs and growth targets.

Value for Money

The past 15 years has seen significant growth in popularity and use of London towpaths, in particular on the Regents Canal which serves Central London and the City. Some London towpaths are expected to receive investment from the Mayor of London's Cycling Vision as Quietways. However, the Regents Canal (expected to remain the most heavily used) and the River Lee Navigation are excluded – both could be improved significantly for commuter and local journeys on foot and bike.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2?

Adequate cycle storage for peak time travel on public transport.

Consider interchange facilities at public transport hubs for connections to nearby canal towpath routes for walking and cycling, including provision of appropriate cycle parking, cycle maintenance services, lockers, toilets and showers to encourage onward bicycle journeys.

Information on links to walking & cycling routes for leisure passengers should be made more easily available on public transport – for example for journeys made one way by train and return by foot or bicycle along towpaths.

2a. How should they be prioritised, taking account of their response to London’s strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

No comments

2b. What might their potential impact be on employment, productivity and housing supply in London and the southeast?

No comments

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Freight Transport by Water

The Trust believes that the environmental impact of the construction phase of Crossrail 2 can be reduced by taking advantage of the River Lee Navigation (a Commercial Waterway).

The Trust has engaged in preliminary conversations with the Crossrail 2 team regarding the opportunity of using the River Lee Navigation as a freight transport corridor to move materials (both construction materials and waste) from the tunnel portal in the Tottenham area out onto the River Thames, via a transfer facility that could be constructed in the Bow area of East London. We would very much like to continue this dialogue and would suggest that the NIC/Crossrail 2 team commission a feasibility study to look at this (and other) options in more detail. Our experience of projects of this nature in the past has led us to conclude that this feasibility study work needs to be undertaken several years ahead of the proposed start of construction.

Safe and sustainable routes to work

We believe that part of a sustainable transport policy during the construction phase of Crossrail 2 should include the provision safe and sustainable routes to work – providing opportunities for the workforce to move away from cars and trains and over to walking and cycling to work. The towpaths running along waterways of London could be part of an integrated Crossrail 2 workforce

transport network and we would like to work with the NIC/Crossrail 2 to develop this concept further.

Utility Corridors

Beneath many of the Trust's London towpaths there are buried utilities such as fibre optic and high voltage electricity cables. These take advantage of direct and straightforward routes around and through the Capital. The Trust believes that further development of these utility corridors could be undertaken to allow improved communications and/or asset resilience.

Energy Production

The water flowing through the Trust's 3200 kilometres of waterways (of which around 100km which pass through and around London) contains enough thermal energy to produce approximately 640 MW of energy. This has attracted a number of businesses which now utilise this low carbon source to heat and cool their buildings. DECC to have acknowledged this potential in their Heat Map which includes a specific canal layer <http://tools.decc.gov.uk/nationalheatmap/>. The energy is extracted using water sourced heat pumps which are very efficient compared to conventional forms of heating and cooling. These efficiency improvements will help reduce the electricity demand and assist in balancing electricity supply. In order to realise this benefit the Trust would urge the NIC to recommend that the renewable heat incentive (RHI) is retained so that this nascent technology can be deployed more widely and possibly assist with the energy requirements of Crossrail 2.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

No comments

4a. What is an appropriate local and regional contribution – given the potential distribution of benefits to business, residents, transport users and the wider economy – and how could this be achieved?

No comments

4b. What innovative funding mechanisms could be considered to support delivery of key schemes?

No comments

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

No comments

Response by Canary Wharf Group to National Infrastructure Commission

0 Summary

0.1 Canary Wharf Group Limited (CWG) is pleased to respond to the call for evidence from the National Infrastructure Commission (NIC) on London's future transport infrastructure. The key points are:

- According to the London Plan, London's housing growth will be primarily focused in east and south east London, highlighting the need for additional transport infrastructure to improve access to areas, particularly those adjacent to the Thames on both sides of the river
- Even with planned rail improvements, there is still a need to enhance orbital rail routes/capacity as a means of providing a better alternative to road travel across Greater London as a whole and also reducing pressure at Central London termini and interchanges
- Crossrail 2 is supported as a means of providing additional rail capacity, but in its original north east – south west orientation.
- The costs of Crossrail 2 could be reduced by:
 - reviewing the alignment in south west London and restricting tunnelling to the section north of Clapham Junction
- The benefits of Crossrail 2 could be enhanced by:
 - extending services in the north to Stansted
 - providing a new eastern branch to serve London Riverside
- Other priorities for transport investment include:
 - New road/rail river crossings east of Tower Bridge
 - Improved orbital and radial road capacity
 - Extension of Crossrail 1 to Ebbsfleet, subject to further capacity studies and provision of at least 30 trains per hour through the Isle of Dogs
 - Further extension of the Bakerloo Line (over and above the recently announced extension to Lewisham) to include a route through Surrey Quays, the Isle of Dogs (and potentially beyond to open up areas adjoining the Thames including the Greenwich Peninsula and Charlton Riverside for housing growth and other development), linking a string of Opportunity Areas identified in the London Plan 2015
 - ensuring road capacity and accessibility meets the needs of essential servicing / delivery vehicles, buses and cyclists.

0.2 CWG would welcome further discussion with the NIC on the ideas presented in this response.

1 Introduction

- 1.1 This evidence for the National Infrastructure Commission (NIC) on London's future transport infrastructure is prepared by Canary Wharf Group Limited (CWG).
- 1.2 CWG is keen to ensure that over the next 30+ years existing and future transport infrastructure will support the Greater London Authority's ("GLA") and Transport for London's ("TfL") objectives as set out in the London Infrastructure Plan 2050: to ensure the foundations for London's continued success as a Global City; to help house a growing London; to support a better, not just bigger, London; and to innovate to develop a transport system of tomorrow.
- 1.3 CWG feel that infrastructure investment should facilitate the maximisation of development potential in the Opportunity Areas (OAs) identified in the London Plan 2015, in particular those in east and south east London.
- 1.4 We recognise that the Commission will not consider opportunities related to airport expansion, and have borne this in mind in preparing this response. We note though that when a decision is made, important choices will need to be made on the locations of transport infrastructure, to ensure flexible services are provided serving all of London's airports and potential expansion locations.
- 1.5 We note that the Commission is not currently tasked with looking at ways to reduce the need for major capital projects by better use of existing and future capacity. Technology and other measures should be explored to achieve better use of infrastructure capacity.
- 1.6 The response is set out as follows:
 - **Section 2** – London and its hinterland – major economic and social challenges
 - **Section 3**- Strategic large-scale transport options, including commentary on potential funding
 - **Section 4** - Crossrail 2 - improving the cost: benefit ratio.

2 London and its Hinterland - Major Social and Economic Challenges

High population and employment growth

- 2.1 The key transport infrastructure challenges, and underlying trends such as population and employment growth have been researched by the GLA and TfL and other interest groups, notably within the London Plan 2015. The GLA predict that London's population could grow from 8.6 million in 2015 to potentially 13.4 million by 2050. The GLA also forecast that the number of jobs within London could increase from 4.9 million in 2015 to 6.3 million by 2041.
- 2.2 Actual growth in travel has also been greater than the forecasts in the Mayor's Transport Strategy (source: GLA London Infrastructure Plan: Transport Supporting Paper (2014)). This further highlights the need to proactively plan and implement substantial improvements to transport infrastructure, particularly to accommodate growth in public transport trips.
- 2.3 TfL estimates public transport trips could increase by up to 60% by 2050, based on projected population growth, with continuing trend mode shift from car use given increasingly dense patterns of development. This underlines the need for further major investment in public transport.

Housing demand

- 2.4 London's forecast population growth will need 49,000 additional homes each year, but only 30,000 are being completed each year. The Future of London's London 2050 workshop concluded "supply of housing [is] an enabling tool for economic growth in London. Housing, taken as a piece of infrastructure, is one of the most (if not the most) important risks to London's economy." Housing demand into the foreseeable future exceeds supply, resulting in high housing costs. Effective transport investment can help by improving connectivity with lower cost areas in London's hinterland, opening up new areas for development and facilitating densification within London.

Ageing population

- 2.5 The London Plan estimates that the number of people over 64 is projected to increase by 64% (nearly 580,000) to reach 1.49 million by 2036. The over 90s are expected to grow in number over the same period, by 89,000. This will require further investment in accessible public transport including flexible demand responsive services and use of vehicles with wheelchair access.

Reducing commuting times

- 2.6 London has the longest average commute time in the UK - 56 minutes per trip each day. Lower value housing areas located along the radial road and main line routes out of London are increasingly being used by commuters, leading to transport infrastructure capacity constraints.
- 2.7 Transport investment should increase capacity on strategic routes, particularly underground and rail routes and this should be combined with high density development around stations. It should improve service reliability, reduce overall journey times, reduce congestion at terminal stations and improve interchange opportunities outside Central London.

Transit-oriented development

- 2.8 London needs higher density development around public transport nodes and increased public transport accessibility to redevelopment and regeneration areas. The focus for investment should be to unlock and raise the cap on development potential, especially within the Opportunity Areas and Areas for Intensification identified in the London Plan, potentially generating greater surplus value to help fund infrastructure delivery.

3 Strategic Large-Scale Transport Options

Priority Rail and Underground Schemes

- 3.1 Key rail and underground network interventions should improve capacity and connectivity within London and on radial links with its hinterland. These should be combined with strategic interchanges between radial and orbital routes to reduce pressure at terminal stations. National Rail's corridor upgrades as shown in the 2050 London Infrastructure Plan should be a priority for funding.
- 3.2 CWG supports Crossrail 2 in principle, as it opens up important connections needed to allow London to grow. However the planned scheme does not tackle the transport challenges outside central London/West End, nor does it address London's Opportunity Areas very well. Therefore, it needs to be complemented by new rail capacity to improve connectivity between and to other key centres of employment and major new development – the City, Canary Wharf (incl. Poplar and Isle of Dogs), City in the East/Tilbury Port, Euston/Kings Cross/St Pancras and Old Oak Common/Wembley.
- 3.3 CWG ask that the Commission consider in more detail the following rail, DLR and underground improvements that meet the strategic objectives by improving both accessibility and connectivity. Prioritisation should be given to schemes which provide improved connectivity, in particular reliability and speed of journeys and which unlock the delivery of housing and jobs within London:
- Crossrail 1
 - provide a new link to the West Coast Mainline from Old Oak Common
 - extend services east to Gravesend and Ebbsfleet, to provide interchange with HS1 services, subject to further capacity studies and provision of at least 30 trains per hour through the Isle of Dogs
 - Crossrail 2 (see more detail in section 4)
 - consider fuller scheme, with extensions to Stansted airport and to Barking Riverside / City in the east (supporting major housing development)
 - simplify scheme in south west London to reduce tunnelling costs
 - take over a Crossrail 1 branch as part of Crossrail 2, providing an interchange station between Crossrail 1 and 2 at Liverpool Street/Shoreditch and seek to avoid problems of turning trains and imbalances associated with Crossrail 1
 - Further east-west rail capacity in the areas adjoining the River Thames in east London in order to support development e.g. Crossrail 2 branch and/or Bakerloo line extensions
 - Bakerloo line extensions over and above the recently announced route from Elephant & Castle to Lewisham, to open up areas of development on the north as well as the south side of the river and improve transport capacity and resilience in east and south east London
 - A new Brighton – Gatwick – Stansted rail link via East London, interchanging with Crossrail 1 and Crossrail 2
 - New orbital rail routes including routes using new river crossings east of Tower Bridge with enhanced interchanges outside Central London, to improve peripheral connectivity and reduce congestion at main termini, such as extensions to the London Overground and improvements to interchange at locations such as Lewisham

- Upgrade main termini to improve passenger experience and reduce congestion
- Increase central /suburban rail capacity - through selective interventions, including capital investment and increasing train lengths.
- World class tube – fund signalling improvements and removal of congestion points to increase running capacity to at least 36 trains per hour on all routes
- Provide Northern Line Extension from Battersea to Clapham Junction
- DLR improvements including:
 - General capacity enhancements, improved service frequencies and upgraded stations
 - An extension from Bank to Euston, including a new station at Tower Hill (to facilitate closure of the Tower Gateway branch)
 - Further extensions to key centres such as Barking and Thamesmead.

Priority Road Schemes

3.4 CWG considers there is a need for a bold approach and agreement to a programme of schemes designed to bring London’s road network up to date including consideration of tolls, road pricing applied to all road users as well as extending the Congestion Zone in order to help fund improvements. Priorities for capital investment in road schemes should focus on providing and improving key links in the road network to improve connectivity, capacity, reliability and journey times, particularly for buses and essential servicing and delivery vehicles. It is particularly important to provide additional Thames crossings east of Tower Bridge to link the OAs in east London, north and south of the river, to maximise development capacity and improve economic synergies in the key development opportunity in London. Priority schemes include:

- Thames crossings in east London, notably at Gallions Reach
- Improved Orbital Routes, such as enhancements to the North and South Circular Roads:
- Underpasses / tunnels (to enhance capacity and improve urban realm), such as a link from the A13 to the A4 via Central London.

Key Funding Priorities

3.5 CWG ask that the Commission gives further consideration to several schemes which appear to offer the best outcomes relative to the GLA’s strategic objectives:

- Crossrail 1 extensions, particularly to Ebbsfleet and the West Coast Main Line
- Crossrail 2 extension to open up access to London Riverside
- Further extensions of the Bakerloo Line to serve planned regeneration areas and Opportunity Areas either side of the River Thames in East London.

Potential Funding Approach

3.6 London has an established framework for strategic spatial and transport planning, through the London Plan and the supporting Mayor’s Transport Strategy. The London 2050 Infrastructure Plan consultation sets the context for the development of the next London Plan and MTS.

3.7 It is imperative that strategic planning, and the infrastructure priorities that stem from this are supported by a long-term, consistent and sustainable funding stream. This means London needs more control over long-term funding and financing of strategic infrastructure.

- 3.8 The principle that the beneficiaries of major investment (people and businesses in London) should fund investment is compelling, and will ensure greater buy-in to infrastructure investment. Fiscal devolution would enable this, and remove some of the political uncertainty of major infrastructure decisions being made by Treasury, where long-term investment could be subject to political risk based on the false perception that investment in London is at the expense of other areas.
- 3.9 CWG support the ambition towards greater fiscal devolution of business rates and property tax revenues. Local income taxes are another option, which we think should apply regionally rather than just in London (as so many in the south-east commute into London, shop and use other services here).
- 3.10 In considering rail investment specifically, we note the recent successes of public/private approaches in London, including:
- Over-station development funding new stations, e.g. Crossrail 1 at Canary Wharf
 - Development cross-funding the provision of the station box at Woolwich Arsenal Crossrail 1 station
 - The anticipation that the Northern Line Extension from Kennington to Battersea Power Station will be fully funded by developments in the Vauxhall Nine Elms and Battersea Opportunity Area.
- 3.11 In considering road investment specifically, we also support the principle of road user charges to better manage London's road network (with tariffs allied to congestion) and to fund vital new road infrastructure. This would be more equitable than the current road tax and fuel duty.
- 3.12 In view of the desire to discourage private vehicle use, funding priorities should be focussed on increasing capacity on rail, DLR, tram and underground services, to open up new areas for housing and development, as well as addressing existing capacity constraints. Nevertheless, funding for roads should also be made to ensure sufficient capacity is provided for the needs of essential servicing / delivery vehicles, buses and cyclists.
- 3.13 Infrastructure providers should also consider ways for development opportunities, such as major housing schemes, to cross-fund new infrastructure.

4 Crossrail 2 – Improving the Cost: Benefit Ratio

Commentary

- 4.1 Crossrail 2 is currently proposed by TfL as a scheme linking Epsom and other locations in south west London with Broxbourne in Hertfordshire and New Southgate in north London.
- 4.2 Although a strategic north-south link will help London to grow and relieve congestion on key underground lines and at Network Rail termini, the proposed scheme misses the opportunity to help open up major housing and employment sites in east and south east London. It also does not serve major destinations such as Stansted Airport.
- 4.3 In south west London, there appears to be duplication with existing suburban services terminating at Waterloo. While possibly relieving congestion, this will add to operational complexity. The tunnelling options in south west London / Chelsea seem to be unnecessarily circuitous and lengthy. Consideration should be given to reviewing the proposals in south west London and providing the tunnel portal closer to Clapham Junction.
- 4.4 Crossrail 2 supports development of 200,000+ new homes along its alignment. It increases capacity between Clapham Junction and Euston, reducing pressure on the underground (especially the Northern and Victoria Lines) and freeing up track and platform capacity at Waterloo and Victoria stations. Connectivity is improved by new interchanges:
- **HS1** - at Euston/ St Pancras
 - **Crossrail 1** - at Tottenham Court Road
 - **Thameslink** – at Euston/ St Pancras
 - **Suburban routes - south** - at Wimbledon /Clapham Junction
 - Suburban routes - north - Tottenham Hale.
- 4.5 It is essential that the new interchanges are designed with sufficient capacity to comfortably handle anticipated passenger flows. This is particularly important at Tottenham Court Road where Crossrail 2 would interchange with Crossrail 1, the Central Line and the Northern Line and the expected numbers of interchanging passengers will be very high.
- 4.6 As currently proposed, Crossrail 2 would provide the primary route to Canary Wharf from the majority of south west London, with passengers interchanging onto Crossrail 2 at Tottenham Court Road. It would provide comparable journey times to the current route via Waterloo and the Jubilee Line, although waiting times for Crossrail 1 at Tottenham Court Road would be longer than those for the Jubilee Line at Waterloo.
- 4.7 10% of Canary Wharf employees currently pass through Waterloo, which the ‘Office of Road and Rail’ recently identified as Britain’s busiest rail station (99.2m entries/exits between 1 April 2014 and 31 March 2015). Recent analyses of TfL Railplan data by CWG have also highlighted that the Jubilee Line is likely to experience increasing congestion in the future in the absence of Crossrail 2. Therefore, CWG sees Crossrail 2 as important for providing journey choice and resilience and reducing waiting times for passengers joining the Jubilee Line at busy times, notably at London Bridge in the morning peak period, especially when Thameslink 2000 is fully operational.
- 4.8 The need to interchange at Victoria mainline station would also be reduced, which is currently Britain’s second busiest mainline station (85.3m entries/exits between 1 April

2014 and 31 March 2015). Particularly in the shorter-term, Crossrail 2 is also likely to relieve the Victoria Line and the Charing Cross branch of the Northern Line.

- 4.9 It is important that real-time information for all key routes is provided on trains on all lines including Crossrail 1, Crossrail 2 and the Jubilee Line. This will ensure that passengers can make informed decisions about which routes to use and where to interchange, based upon up-to-date knowledge of operating conditions and train occupancies.

Suggested improvements

- 4.10 CWG considers that the effectiveness of the current Crossrail 2 proposals could be improved as follows:

- Provide a branch from Euston/St Pancras to east London taking over the Crossrail 1 branch to Shenfield with a Crossrail 1/Crossrail 2 passenger interchange at Liverpool Street/Shoreditch. This would enable the Abbey Wood branch of Crossrail 1 to run with up to 30 trains per hour and would provide more rail capacity to and through the Isle of Dogs and Opportunity Areas in east and south east London
- Subject to further detailed capacity studies and provision of 30 trains per hour through the Isle of Dogs, it would be possible to extend Crossrail 1 to connect with HS1 services at Ebbsfleet and assist with regenerating North Kent Thameside
- If Crossrail 2 were to take over the Shenfield branch, it may also be possible to build another Crossrail 1 branch east of Custom House possibly taking over all or some of the c2c lines. This would support major housing development areas and higher density development in the east London Opportunity Areas including the Isle of Dogs, Royal Docks and London Riverside
- Extend Crossrail 2 services to serve Stansted Airport. This would significantly improve connectivity between central London/ City /east London and Stansted Airport and between Stansted and Heathrow as well as increasing the housing and employment development potential in the Upper Lee Valley Opportunity Area and beyond.
- Relocating the tunnel portal nearer Clapham Junction. This would reduce the costs of the route in south west London.

Infrastructure for a physically active nation

Submitted by Dr. Angie Page and Jess Read MSc., Centre for Exercise, Nutrition and Health Sciences, University of Bristol

Dr. Angie Page is Reader in Physical Activity and Public Health at the Centre for Exercise, Nutrition and Health Sciences at the University of Bristol.

Jess Read holds a MSc. in Nutrition, Physical Activity and Public Health with distinction from the University of Bristol. She has worked for 15 years as an urban planner delivering innovative “liveable cities” projects for cities such as Copenhagen, New York, Shanghai, and London typically using urban flood mitigation to co-finance walking and cycling infrastructure upgrades. She currently works at the Centre for Exercise, Nutrition and Health Sciences at the University of Bristol.

Physical inactivity is estimated to cause 17% of deaths¹ and costs the nation £20 billion per year². The government ambition set out in “*Moving More, Living More*” is for a more physically active nation with all the potential health, social and economic benefits this can provide³. National physical activity and transport surveys provide clear evidence that transport is one of the most important sources of physical activity for both adults and children⁴. UK policy endorses that transport should assume physical activity delivery as a primary objective⁵.

UK levels of physical activity are low for adults and children⁶. This disproportionately affects women and girls. For example, there are currently over 10 million adult women in England alone who do not achieve the national physical activity guidelines of 150 minutes of moderate-to-vigorous physical activity per week⁷. Gender inequity is evident across physical activity settings, socio-economic categories and age⁸, indicating that a gendered approach to facilitating physical activity is necessary to equally include women. As such, **walking and cycling infrastructure must be designed specifically to meet women’s needs present and future as walking is their single most important source of physical activity.**

Pedestrian and cyclist safety in England is poor in both absolute and relative terms. The rate of killed or seriously injured per billion miles is almost 20 times higher for pedestrians than car occupants (484 vs. 25 respectively) and 43 times higher for cyclists than car occupants (1080 vs. 25 respectively)⁹. These rates are 3 to 10 times higher than absolute traffic injury rates of European counterparts such as Sweden, Denmark and the Netherlands, and up to 19 times higher when comparing rates for children¹⁰. Even allowing for the methodological limitations of traffic injury rates per distance travelled, this international data clearly suggests that our national traffic safety ambitions can be improved. Many cities across the world are adopting **zero accident targets for pedestrians.**

The economic case for infrastructure investment can not be made effectively without considering impacts on health. This is equally true for all areas of England including the north.

To this end, the following actions should be embedded as part of the national infrastructure strategy.

- 1) The inclusion of walking and cycling infrastructure within the infrastructure plans at a scale sufficient to facilitate measurable population increases in physical activity year-on-year in line with UK policy and the national physical activity ambition and Chief Medical Officers' national physical activity recommendations for both adults and children.
- 2) Ensuring that design and access to new walking and cycling infrastructure is open to currently underserved groups, particularly women and girls.
- 3) New planned infrastructure will deliver improvement in safety for pedestrians and cyclists measured in absolute terms as killed or injury per distance travelled, with a progressive goal towards zero deaths and serious injury for pedestrians and cyclists.
- 4) Further development of economic costs for different forms of travel in relation to economic, societal, climate and health benefits. This should include assessment of impacts on health, health costs, productivity, local spending, congestion, accidents, and air pollution.

This is an incredible opportunity to put physical activity and the nation's health at the heart of this national infrastructure investment strategy. This is the type of joined-up, innovative response widely recognised as necessary to increase population levels of physical activity and reduce disease risk both of which contribute directly to economic prosperity.

Introduction

Over the past decade we have seen infrastructure creep up the agenda to a point that it is now firmly placed at the heart of the political debate. With investment in major transport, energy and utility projects increasing to record highs and the development of the National Infrastructure Plan to set out key Government priorities, we have reached a stage where infrastructure is a nationally significant issue that transcends party political ties.

The formation of the National Infrastructure Commission last year was greatly welcomed by the industry and provided a great level of confidence in the deliverability of major projects and enables the current Government and future administrations to speed up decision-making on vital transport, energy and housing programmes that Britain needs to continue to grow its economy.

CH2M is a global engineering and programme management company that works in the areas of areas of water, transportation, environmental, energy, facilities and defence. With over 2,500 people employed in the UK, CH2M is currently working on some of the most iconic infrastructure programmes including Crossrail, High Speed 2, Thames Tideway Tunnels, Crossrail 2, the decommissioning of Dounreay and was one of the leading partners in CLM, Delivery Partner to the ODA for the London 2012 Olympic & Paralympic Games.

Given our experience of working on the development and delivery of major UK infrastructure projects, we felt it may be helpful to share some of our thoughts around the points laid out in the NIC's call for evidence in order to share the lessons learned for the efficient delivery of future infrastructure priorities. In particular, this document presents our views for large-scale transport infrastructure improvements in London. We have made separate submissions outlining our views for infrastructure priorities for northern cities and electricity interconnection and storage.

Large-scale transport infrastructure improvements in London

Q1 – What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

In order for London's economy to continue to thrive and be globally competitive, London will need a step change in investment over the next thirty years that not just upgrades existing infrastructure but catalyses the city's growth through intensification of development in opportunity areas outside the central core.

The dense clustering of businesses in the centre creates synergies (agglomeration benefits) that make Inner London one of the most productive regions in Europe¹. These synergies are dependent on a network that efficiently moves millions of people per day to and from their place of work. Despite technology being available for employees to work remotely, strong demand for office space in Central London demonstrates that being physically present is as important as ever and the need to move large numbers of people to and from their places of work will likely persist.

London's robust economic growth, urbanisation and growing population is expected drive demand for additional transport capacity over the next three decades. London's transport stakeholders have risen to the challenge by delivering major projects such as Crossrail 1, Thameslink Programme and the Tube upgrade programme, which will provide London's residents with substantial improvements in capacity and connectivity across the network. Yet the capacity that these programmes deliver will not be sufficient to meet all of the expected demand. As London expands spatially and economically, further large-scale transport investment will be needed to deliver capacity on radial corridors that connect orbital routes to new urban employment centres while enhancing connections to the commuter hinterland. This will involve the proposed Bakerloo extension and Crossrail 2 to connect less well connected areas in the boroughs in the north, south east and south west where there exists potential for higher densities of housing and employment around transport interchanges.

As a global city, London's future competitiveness depends on being able to continue to attract and retain a high quality labour force which allows the city to sustain growth over the long-term. The cost of housing is a major challenge for London which leads to higher wage bills for employers and forces many of London's residents to move further out into the commuter hinterland to find affordable housing or migrate away from the city.

¹ Eurostat, 2015, Regional labour market statistics – GDP per person employed, NUTS2 level (2012 data)

Best-practice urban planning emphasises the importance of good public transport accessibility for the development of higher density housing. This allows residents to access their place of work within a reasonable journey time, and minimises the negative economic and environmental impacts of road congestion. Inevitably the Opportunity Areas where new homes are planned, many of which are located in outer boroughs, have lower levels of transport connectivity. To make these developments viable, London will need new high-quality rail links which connects these locations to employment centres in inner boroughs, and to ease congestion on existing routes.

Q2 - What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

CH2M's experience of evaluating and delivering some of London's largest transport infrastructure programmes informs us of the importance of closely aligning the timing of planned infrastructure improvements with strategic objectives. This involves prioritising transport projects such that their timing maximises economic benefits for the areas they serve and anticipating infrastructure requirements for the development of specific Opportunity Areas.

The Mayor's London Infrastructure Plan sets out the infrastructure projects that London will be required up to 2050 in order to sustain economic growth, maintain London's global competitiveness and provide for London's housing and employment land needs. However, a consideration for how these projects should be prioritised is not explicitly covered in the plan. Over the short to medium term, projects such as the Tube upgrade with clear benefits in terms of capacity, reliability and journey times should be prioritised, but over the longer-term this will not be sufficient to meet growing passenger demand and to relieve congestion. This is why larger scale projects such as Crossrail 2 and the Bakerloo Line Extension are being planned to deliver a step change in capacity.

Beyond providing extra capacity, further strategic and economic considerations must be taken into account. The London Plan sets out a spatial development strategy which focusses on the densification of urban centres with good transport links and the development of Opportunity Areas where there exists significant capacity to build new housing and employment space taking into account London's urban form which is bounded by a protected green belt. London's future development requires transport infrastructure with frequent, high capacity radial and orbital rail links to provide connectivity between these Opportunity Areas, to the urban core and to the commuter hinterland.

Some Opportunity Areas will develop with minimal public sector intervention while others will require substantial investment in essential infrastructure in order to be viable. This includes the Upper Lee Valley where it is recognised that a major improvement in transport accessibility via Crossrail 2 will be needed to unlock its housing potential. The Thames Gateway is another area with huge potential for residential development. However, over the years London's policy framework has not been able to unlock the full potential of the land. This points to the need for additional transport infrastructure beyond proposed schemes such as an extension of the DLR network in order to enable development in this area.

A key issue facing London in the future will be to find the space to accommodate a workforce that is expected to increase by one million over the next two decades². More people will put substantial pressure on London's already strained road network and pedestrian walkways, particularly in Central London. The historic layout of the city centre means that there is limited scope to expand road capacity. Strategy will therefore need to consider options that allow more efficient usage of existing roads, cycleway and pedestrian walkways supported by investment in smart road signalling technology and expansion of the cycle rental scheme and the cycle superhighways network.

Q3 - What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

CH2M is currently advising TfL on the business case for Crossrail 2 (CR2) which restricts our ability to provide detailed comments specifically about the costs and benefits of that scheme.

More generally, the DfT transport appraisal guidance (WebTAG) provides a robust and comprehensive framework that is comparable to the best in the world³. Recent changes have seen wider economic benefits appraised as part of the framework alongside direct transport user benefits. This represents a major step forward for the appraisal of major transport projects. However, it is acknowledged by the DfT that in some circumstances, the appraisal framework does not fully capture the economic growth impacts of transport projects⁴, particularly large projects

² GLA Economics, 2015, Updated employment projections for London by sector, Greater London Authority.

⁴ Department for Transport, 2013, Understanding and Valuing the Impacts of Transport Investment, DfT.

such as HS2 and Crossrail 1 that are expected to change the economics of private investment in areas along the route, and produce regional and national level economic growth impacts.

Major transport schemes provide not just transport benefits but also support sustainable economic development, housing development and regeneration. CH2M's experience working across development and infrastructure sectors including water and energy underlines our view that it is important to adopt a holistic approach to evaluating infrastructure investment which takes into account all the transport and economic benefits of proposed schemes. These benefits are not currently quantitatively evaluated as part of the WebTAG framework but methodologies have been developed by other Government departments including DCLG for valuing the impacts of transport schemes on additional housing supply and land values. This points to the critical need for cross-departmental appraisal guidance, which follows the principles of the Green Book and the subsequent Five Case model, and importantly takes into account the various non-transport based economic externalities facilitated by transport investments.

From CH2M's own experience in delivering some of the UK's largest infrastructure projects, and reflected in DfT's 2014 commissioned report⁵ on how to extend and improve appraisal techniques in order to fully capture economic impact of transport investments, it is acknowledged that new techniques will be needed to fully account for the all economic impacts of projects such as Crossrail 2. This will involve quantifying the 'real economy' impacts of proposed interventions, covering the interactions between infrastructure, land use and spatial development. This will require using models that predict changes in land use associated with the transport intervention and the resultant uplift in land value, as well as Spatial Computable General Equilibrium (S-CGE) models, which has been used in support of our work for Lower Thames Crossing, that measure the true impact of strategic transport investments at regional and national economies.

Regarding the scheme's costs, we are of the opinion that adopting innovative contracting methods and programme management techniques, like those introduced by CH2M for delivering critical infrastructure associated with the London 2012 Olympics, could bring some efficiencies. In particular, such approaches could encourage contractors to deliver and share cost efficiencies during the delivery stage. They could also enable the programme to roll on and off the contractors responding to the changing need over different delivery phases.

Q4 - What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

CH2M is currently advising TfL on the business case for Crossrail 2 (CR2) which restricts our ability to provide details regarding the proposed funding arrangements of that scheme.

That said, the funding and financing options for Crossrail 2 have been explored in the *Funding and Financing Feasibility Study*⁶ undertaken for TfL by PwC. This includes examining the potential of using funding mechanisms employed by Crossrail 1 and Northern Line Extension (NLE). In the case of Crossrail 1, local funding was raised from a Mayoral Community Infrastructure Levy (CIL), Section 106 developer contributions, a business rates supplement for Greater London and the sale of land and property used during the delivery phase along with major contributions from Canary Wharf Development Group and Heathrow Airport Ltd. The Northern Line Extension receives funding from long-term business rate increments and a proportion of borough-level CIL and S106 receipts related to new developments in the Vauxhall Nine Elms enterprise zone.

Compared to Crossrail 1, where large sections run through the city centre, the benefits of Crossrail 2 are expected to be more broadly distributed across London's businesses, residents, transport users and the wider economy. This will mean a different funding package will be needed relative to Crossrail 1. This could include section 106 developer contributions, the extension of the Mayoral CIL and introduction of borough-level CILs to capture value uplift in areas substantially affected by the scheme. The funding package will also need to consider other options which were not possible for the Crossrail 1 funding package.

One option that would have important benefits for transport infrastructure funding would be the devolution of some taxation powers to London. London is more dependent on central government funding and has much lower levels of fiscal autonomy than other major international cities such as New York or Paris. A 2013 report commissioned by the London Finance Commission⁷ shows that London collects the lowest municipal taxes per

⁵ Laird J., Venables J. and Overman H., 2014, Transport investment and economic performance: Implications for project appraisal, DfT.

⁶ PwC, 2014, Crossrail 2 Funding and Financing Study, TfL.

⁷ University of Toronto Institute on Municipal Finance and Governance, 2013, 'International Comparison of Global City Financing', London Finance Commission.

capita amongst seven major city comparators. Only 26.2% of London's funding comes from own-source revenues compared to 82.5% in Paris. This limits London's autonomy to be able to fund and finance large-scale transport infrastructure improvements in the capital and make strategic decisions regarding investments.

Private financing has been used successfully for the Thames Tideway Tunnel using a regulated asset base model, whereby the finance costs are covered through the regulatory system. An adapted approach could be used by Crossrail 2 to secure private finance by issuing bonds which would be repaid by the Mayoral CIL and Business Rate Supplement. This would be a departure from previous rail financing mechanisms, which have involved either the DfT, GLA or TfL securing loans from public sector sources such as the Public Works Loan Board which are repaid through fares or the business rate supplement. However, a private finance approach may provide advantages through transferring a portion of the risk away from the public sector.

Capturing land value uplift attributed to improved transport accessibility in station catchment areas could provide an alternative funding stream if it can be captured through Stamp Duty Land Tax and Council Tax increments. A report by GVA⁸ predicts that Crossrail will increase residential capital values around stations on the route by between 20% and 25% up to 2021. Capturing such increases in capital values will of course be dependent on the regional devolution of powers to collect this revenue.

The current council tax system (where bands are set using 1991 property values) makes it difficult for increases in tax revenues to be captured and directed towards funding major transport infrastructure. In the Netherlands, capturing land value increments are made easier through a local property tax which is calculated as a percentage of the real (inflation adjusted) value of the property.

A further possible step would be the removal of TfL borrowing limits while retaining prudential borrowing rules. This would have the effect of improving flexibility to fund major transport schemes. Fiscal devolution could also provide financial incentives for boroughs to take difficult planning decisions, which would benefit from retaining some of the increases in tax revenues. More flexibility on borrowing limits would also allow TfL to replicate the example of MTR (Hong Kong's metro operator), which develops the assets above and around underground stations into commercial and residential schemes in coordination with city authorities. MTR uses revenues from these investments to fund the cost of expanding the metro network. In areas where Crossrail 1 stations already exist such as Tottenham Court Road, land value capture could be maximised through strategic location of station entrances. While it is acknowledged that there are substantial differences between London and Hong Kong which makes the comparison difficult, most notably the fact that all land in Hong Kong is owned by the authorities, there does exist an argument around the more effective development of TfL assets, and this could be facilitated through greater borrowing freedoms for TfL and the GLA.

Submission by the Chartered Institute of Logistics and Transport

to the

National Infrastructure Commission call for Evidence:

London's transport infrastructure

Introduction

The Chartered Institute of Logistics and Transport (“the Institute”) is a professional institution embracing all transport modes whose members are engaged in the provision of transport services for both passengers and freight, the management of logistics and the supply chain, transport planning, government and administration. Our principal concern is that transport policies and procedures should be effective and efficient, based on objective analysis of the issues and practical experience, and that good practice should be widely disseminated and adopted. The Institute has a number of specialist forums, a nationwide structure of locally based groups and a Public Policies Committee which considers the broad canvass of transport policy. This submission has been prepared by the Institute’s London and South East committees.

1 What are the major social and economic challenges facing London and its commuter hinterland over the next two to three decades?

- 1.1 Continuing population growth due to migration from other parts of the UK, Europe and beyond, increasing life expectancy and increases in younger populations.
- 1.2 Acute accommodation shortages and/or major expansion of housing stock requiring major increases in transport provision (bus and all forms of rail) to meet the demand for ever longer commuting journeys.
- 1.3 Changes to personal mobility patterns due to driverless personal transport which could have major implications for transport requirements as well as causing major difficulties for road capacity and parking provision in congested areas. NB the technology is as yet unproven and could be of little use where there is conflict with pedestrians, cyclists and other non-automated road users.
- 1.4 Changes to relationship between UK and Europe and break up of UK could have a huge effect on the viability of London and the south East which could cause either a strengthening or serious decline in the importance of London as a world

class centre. The result of the European Referendum could lead to major changes to London's importance in the world that at this stage are difficult to quantify.

1.5 Technological changes that could disperse working locations, particularly the increase in homeworking although effects of this on commuting are as yet relatively limited.

1.6 Increasing inequality, which risks resulting in options for funding transport enhancements through charges or higher fares being rejected as unfair and politically infeasible.

2 What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail, and underground – including, but not limited to Crossrail 2

2.1 The options will depend on where the increase in the housing stock and in workplaces to accommodate the projected growth in London's population and employment is to be built.

2.2 Material increase needed in road and rail capacity on a number of routes within around Greater London. Currently capacity constraints are particularly acute on lower Thames river crossings as well as a number of key trunk routes in the South East and London. Whilst alternatives to car use and road freight transport need to be constantly sought to minimise the need for road capacity expansion it has to be accepted that free commercial traffic movement on key routes is essential for local, regional and the national economy.

2.3 Improved freight capacity and facilities needed within London and wider south East to cater for population increases, changes to travel patterns brought about by technological changes, particularly the move to online ordering and delivery. Transshipment between trunk and local movements will be essential both within road transport and between sea, rail and road. Ways of increasing non-road freight route capacity need to be found which could be around rather than across London. Ways would also need to be found to attract freight operators towards routes where there is greater potential capacity as opposed to routes already seriously constrained.

2.4 Future airport and runway decisions will have a considerable impact on transport flows in South East. Consideration needs to be given to developing other airports around London for freight and passenger movements (e.g. Stansted, London City, Luton and Southend) as well as the reopening of Manston, which could reduce traffic movements in critical areas of the road network. Building up some of these airports would also help strengthen local economies by improving local connectivity and job creation.

2.5 Greater use of River Thames and canal systems in and around London needs to be considered including what improvements to infrastructure are needed to make best use of these resources. The Thames can be used for passenger as well as freight flows. NB Wharfage has to be protected from high end housing schemes to allow future developments to happen.

2.6 Improvements to public transport in the areas outside the London boundaries would improve local connectivity and reduce car dependency which would reduce pressure on road and rail infrastructure within Greater London (See Section 6 below).

How should they be prioritised, taking into account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

What might their potential impact be on employment, productivity and housing supply in London and the South East?

2.7 Assuming that the current demographic and employment trends continue housing supply throughout the south East will need to grow considerably although a change to London's economic performance could slow this down or even reverse the requirement although population increases are likely even if the economy weakens considerably

2.8 Automation and homeworking could reduce the pressure within London and encourage more people to live further out. They would also materially affect the transport network and future assumptions regarding network capacity.

2.9 Unless there is increased public and private investment there will be a considerable housing shortage for the foreseeable future

2.10 Both Transport for London and the Department for Transport have well-established decision-making processes set out in the respective organisation's Transport Business Case. Priorities should continue to be determined against these criteria.

3 What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme

3.1 Integrate as much as possible with existing rail infrastructure and any disused rail corridors still extant to minimize construction costs

4 What are the options for the funding, financing and delivery of large-scale Transport Infrastructure improvements in London, including Crossrail 2

- What is the appropriate local and regional contribution- given the potential distribution of benefits to business, residents, transport users and the wider economy- and how could this be achieved?

4.1 Better cooperation and integration of planning, infrastructure, housing etc. between Greater London and surrounding authorities (as per City Regions in rest of UK). Also closer working between the authorities outside Greater London.

- What innovative funding mechanisms could be considered to support delivery of key schemes?

4.2 Regional/local taxation

4.3 Road user charging and expansion of congestion charge – This will be vital if automated personal transport takes off

4.4 More effective use of developer contributions which could include a levy on developers in addition to or as an alternative to the current mixture of measures, some of which encourage wasteful spending by developers.

5 How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there lessons to be learned and applied in London?

5.1 Do European and other major Regional Transport Authorities provide a model for London to follow or does the London model work just as well?

5.2 Highway planning and management and bus services are dealt with differently outside the TfL area which inevitably constrains development. Funding in Shire and unitary areas is seriously constrained and getting ever more so year by year. This needs to be reviewed and changed if necessary.

5.3 UK Transport policy is based on the premise of maximising farebox contribution (usually involving annual fares increases at above-inflation rates) which is not the case in many other countries, particularly in Europe. The benefit of minimising subsidy against the extra capacity that would be required to accommodate demand from greater support levels needs to be reviewed and whether the provision of greater passenger transport capacity at more affordable fare levels and resulting increased usage would free up alternative road capacity for freight movement. There is also an affordability issue for lower paid workers who are paying a larger proportion of their income on transport in London than in major cities outside the UK.

6 General Comments and Points for Consideration

- 6.1 Clarity is needed on what constitutes London and what constitutes the south East and how far away from London the review should consider. For example improved transport links between Oxford and Cambridge, East Coast ports and the Midlands, along the south coast and between Kent and the Crawley/Gatwick/South London areas could all reduce vehicle and passenger movements into and out of London. What is good for London may not be good for the South East as a whole and vice versa. Transport needs, funding, provision, infrastructure and charging regimes should be less constrained by political boundaries. If current population trends and housing supply constraints continue people will continue to migrate outwards from London although transport affordability and in many areas, availability, raises a constraint to such outward migration as does an overloaded road and rail network.
- 6.2 Relative employment opportunities between London and the South East need to be considered as a whole with a view to spreading benefits to reduce the effects of overheating on the London economy and strengthening other economies that have suffered severe decline (e.g. south eastern seaside communities). This also needs to take into account the economies of regions throughout the UK and particularly within the northern super-region i.e. joined up thinking is essential for the UK as a whole.
- 6.3 Spending money on improved infrastructure in the South east may be more effective and deliverable as well as cheaper than directing the lion's share of expenditure into the Greater London area.
- 6.4 More clarity is needed as well as consistency within the region on what the priorities for transport related expenditure should be e.g.;
- Public v private transport and the role of cyclists and pedestrians
 - Passenger v. freight
 - The level of constraint on demand and desire for sustainable transport options
 - Road v rail and water
 - Airport capacity and locations
- 6.5 Other infrastructure considerations that have to be considered include;
- Funding the effects of climate related issues including coastal erosion from extreme weather (the current closure of the rail link between Dover and Folkestone is an example) or the loss of bridges, road damage etc. from flooding. These problems appear to be increasing due to the effects of global warming.

- The potential to damage to transport or other subterranean structures as a result of the increasing amount of below-ground building to provide additional residential capacity by building down rather than extending upwards which would be unlikely to receive planning permission. Planning regulations are probably the solution to this issue.

6.6 Overall Connectivity both within the South East and Beyond

- A high proportion of total transport movements between the UK and Europe travel through South east England and Kent in particular. As was seen in summer 2015 these movements are prone to major disruption whether due to industrial action, security issues or severe weather in the English Channel. Adequate capacity for freight transport to and from Europe is essential, particularly parking and driver rest facilities as well as provision of improved terminal facilities at other ports to allow for use by large ships when problems arise at the regularly used ports. Strengthening of rail capacity to the channel tunnel and ports is also needed (including around London to encourage trunk movements from the rest of the UK) to reduce the dependency on road networks. Continued development of North Sea and Thames Estuary ports with improved rail links should also be encouraged.
- As already alluded to outside the Greater London area public transport provision is generally to a much lower level, particularly on the majority of routes that are not rail-linked. Bus services are generally infrequent outside urban areas and often non-existent outside the core Monday to Saturday daytime period. The bus network (as well as the local charging regime) is almost entirely designed around what the commercial operators deem to be profitable that may or may not be the optimum network for a particular area and provision levels can vary considerably between comparable areas and bus operator groups. The road network is generally full to capacity at busy periods, Funding within non-metropolitan areas has been to traditionally lower levels than in London and is declining annually at an alarming level. If the current culture of car-dependency with its consequent resulting in an inefficient and environmentally questionable transport network is to be tackled a rethink is needed on how South Eastern England's transport network is funded and managed and how the planning system could be improved to reduce conflicting travel flows. The alternative will be a declining local economy due to the difficulty of moving freight and people around the South east and increasing inequality of movement for those without easy access to private transport.

- Regardless of London the South East is a very diverse area economically and demographically. There are a limited number of large cities but some major conurbations covering wide areas including the Brighton/Hove/Worthing conurbation, the Medway Towns, the South Thames side area, the Crawley/Gatwick/Redhill area and further afield the Solent area conurbation that includes Portsmouth, Southampton, Eastleigh, Fareham and surrounding areas. Transport links in and to and from these areas are in most cases poor when compared with comparable areas in other parts of the country as well as being heavily congested.

6.7 Whatever changes are made to discourage unnecessary movements within the Greater London area a balance has to be struck between the core London economy and the economies of the wider South East (and beyond). Evidence has been found (and which has been used to make the case for Crossrail 2) that productivity is higher in central London than elsewhere, even when differences in skills etc. are accounted for and concentrating high value employment in high cost areas generates income and revenue to fund the level of infrastructure needed in central London which would be unlikely to be justifiable anywhere else. Therefore a balance has to be struck between the differing economies in different areas. i.e. there is a need for joined up thinking that crosses political boundaries, business sectors, vested interests etc. that leads to decisions that benefit the UK as a whole as well as both London and the outer South east.

National Infrastructure Commission call for evidence, November 2015

**Memorandum from the City of London Corporation
Response to Question 3: London's transport infrastructure**

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The City of London Corporation is committed to supporting and promoting the case for enhanced transport infrastructure, particularly in relation to rail services. As London's population grows and as the challenges of maintaining the Capital's status as a global city increase, a continuing programme of improvements will be needed to reduce congestion and free up capacity on rail routes serving the City of London and provide a stimulus to employment and housing growth in the London area.

The provision of adequate transportation infrastructure to cater for London's growing population and expanding employment base will continue to be a major challenge for the foreseeable future. Strong employment growth is already happening in the City of London; the City's local employment market is strong and total employment increased from 344,000 in 2008 to 414,000 in 2014. This is consistent with the aims of the London Plan 2015 and the City of London Local Plan 2015 which are both planning for significant office and employment growth and modest housing growth in the City of London by 2026. The range of office occupiers has broadened in recent years from its financial services base so that the City is now seen as an attractive business location for a wide range of companies. However, maintaining the City's competitive position as the world's foremost international business and finance centre is heavily dependent upon good transport links both within London and its commuter hinterland. In addition, the urgent requirement for additional housing in the London area will also increase the need for improved transport links between the suburbs and the central business district.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Although various important transport projects, such as Thameslink and Crossrail, are under way, the legacy of many years' under-investment in the Underground and National Rail means that the additional capacity provided by these projects is likely to be fully utilised shortly after they open. Thus a continuing programme of rail capacity enhancements is required with a particular focus on improving the accessibility of areas with potential for major housing development such as the Lea Valley, Ebbsfleet, Barking Reach in the east and Old Oak Common in the west. Additionally from a business perspective there is a need to improve rail links to London's airports.

The City Corporation's priorities include:

Crossrail - This project will significantly improve east-west rail connections across London but the proposed train service pattern does not make full use of the new infrastructure, as a significant proportion of trains from the east will not travel beyond Paddington. The following measures are therefore recommended in order to maximise the value of the project:

- Extension of Paddington terminating trains to Tring/Milton Keynes on the West Coast Main Line via a new connecting line at Old Oak Common. This improves utilisation of the Crossrail tunnels, improves accessibility of the Old Oak regeneration area, provides new direct links to the West End and the City for commuters from north-west London and beyond and reduces the number of trains terminating at Euston (thus releasing capacity for HS2 and other services).
- Extension of Crossrail from Abbey Wood to Ebbsfleet and Gravesend to facilitate housing development in North Kent, particularly the development of Ebbsfleet Garden City.
- Provision of a direct fast Crossrail service between Heathrow T5, central London and Canary Wharf. Current proposals only provide for a stopping service between Heathrow T4 and central London which will not meet the requirements of many business travelers. This may require the amalgamation of Heathrow Express services into Crossrail.

West Anglia Main Line – Four-tracking the West Anglia Main Line is a key priority as it will allow a significant increase in capacity by separating fast and stopping services on this congested corridor. This will meet the long overdue need for faster and more frequent services to Stansted Airport and Cambridge and allow the provision of enhanced commuter services which will open up the potential for significant housing development around stations in the Lea Valley regeneration zone. Four-tracking is a necessary precursor to the future extension of Crossrail 2 services beyond Tottenham Hale.

Crossrail 2 - Although Crossrail 2 does not serve the City of London directly, it will boost the capacity and resilience of the central London public transport network and help to relieve overcrowding on key rail and Underground routes which do serve the City. This in turn will increase the attractiveness of the City and help to maintain its position as the world's leading financial and business centre. The key benefits for the City are:

- a reduction in severe overcrowding on Northern line;
- relief of congestion on suburban services into Waterloo;
- relief of congestion on suburban services into Liverpool Street;
- release of capacity at Liverpool Street through the diversion of some West Anglia suburban services onto Crossrail 2 which will allow enhancement of other services, such as those to/from Stansted Airport;
- release of capacity at Waterloo through the diversion of some South West suburban services onto Crossrail 2 which will allow enhancement of longer distance services, such as those to Woking, Guildford etc.;

- potential relief of crowding on the Central line if the future Eastern branch of Crossrail 2 is pursued:
- a significant improvement in accessibility for neighbouring Hackney and the Upper Lee Valley which will assist with regeneration and housing growth.

London Overground – TfL's proposal to extend the Gospel Oak-Barking Line to serve Barking Reach is supported as a means of opening up this area for much-needed housing development.

London Underground – It is essential that there is continued investment in upgrading the London Underground network. Passenger numbers are at an all-time high and look set to grow further, so it is very disappointing that some planned improvements, such as the re-signaling of the sub-surface lines, have been seriously delayed. The following are key priorities:

- Bank Station Capacity Upgrade - Transport & Works Act powers were granted in 2015 and implementation now needs to be expedited to deal with critical congestion problems at this key interchange.
- Sub-surface re-signaling – urgently needed to increase capacity on the Circle, District, Hammersmith & City and Metropolitan Lines.
- Extension of the Bakerloo Line to Hayes to improve accessibility of south-east London and release capacity on National Rail routes into London Bridge.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The main opportunity to increase the benefits of Crossrail 2 is the proposed Eastern extension which will open up opportunities for regeneration in East London and help to relieve overcrowding on the Central Line and National Rail routes serving Liverpool Street.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

As has been seen with the Jubilee Line Extension and Crossrail, land and property values raise in expectation of future transport enhancements. There must be close coordination between the GLA, TfL, London Boroughs and other planning authorities outside of Greater London to ensure that planning policy is coordinated to maximise the benefits arising from infrastructure improvements.

To make sure that the benefits of future transport improvements are captured there needs to be an early comprehensive assessment of current land values, which should then be used to capture increases and recoup some of the uplift. The private sector should be expected to provide significant funding as businesses will directly benefit from such infrastructure improvements.

A key issue is to ensure that funding arrangements give the private sector certainty about their levels of contribution. In addition planning authorities need to develop policies (for example, in relation to social infrastructure and affordable housing contributions) which reflect changes in accessibility brought about by transport improvements.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

No comment

CECA Consultation Response

Civil Engineering Contractors
Association
1 Birdcage Walk
London
SW1H 9JJ

National Infrastructure Commission
1 Horse Guards Road
London
SW1A 2HQ

8 January 2016

Dear Sir/Madam

[National Infrastructure Commission call for evidence](#)

1. The Civil Engineering Contractors Association (CECA) welcomes the opportunity to respond to the above named consultation.
2. CECA provides the voice for those companies large and small who create, improve and maintain the UK's vital transport and utility networks. Our membership of more than 300 companies together delivers an estimated 70-80 per cent of all infrastructure construction work carried out nationwide. Our industry supports the employment of around 200,000 people with annual output of up to £25 billion.
3. We have long argued that the development of infrastructure in the UK has lacked long-term strategy. This has meant that large projects such as Crossrail and High Speed 1 have taken far too long to develop and build. Today, the delays we continue to see in solving the problems of airport capacity reflect this challenge.
4. Delays damage the construction industry's confidence in national infrastructure planning, resulting in lower investment in innovation and training within the industry.

The National Infrastructure Commission

5. CECA therefore welcomed the news in October 2015 that Chancellor George Osborne would establish an independent infrastructure Commission to help Government plan for the long-term. This is a policy change we discussed in our 2014 policy document, *The Infrastructure Decade*. It was also a recommendation of *Securing our Economy: the Case for Infrastructure*, CECA's joint report with the Centre for Economic and Business Research in 2013.
6. We anticipate that the new Commission will be given real authority to assess and make proposals for long-term major infrastructure projects alongside its development of innovative solutions to fund these infrastructure requirements.
7. In our view, the Commission should build on the existing National Infrastructure Plan to provide an overarching national infrastructure policy framework, linking to all Government departments and major stakeholders, helping to align strategies.
8. The new Commission must be empowered to become a truly independent expert body with a clear long-term role. This would give the construction industry, the business community and the wider public confidence in the direction of UK infrastructure for the long-term.
9. We recognise that the Commission has been established to advise on infrastructure, rather than to make decisions. It is appropriate that the final decision on matters related to strategically important infrastructure issues rests with those who have been given a democratic mandate to do so.
10. However, we also recognise that the credibility of the Commission, and its potential to build confidence in the long-term future of the UK's infrastructure planning, will be strongly linked to how the Government of the day responds to any advice that it provides.
11. As such, we would have concerns if the Commission's advice is not typically accepted and acted upon. Were this to be the case, there is a risk that the Commission would actually serve merely to perpetuate and amplify the political challenges that it has been established to help cut through.
12. **We anticipate that the Commission will prepare an annual report of its activities. We recommend that this report provides an item-by-item overview of the advice that has been provided to government, along with a RAG rating of whether that advice has been implemented in part or in full. This will allow stakeholders to have visibility of the Commission's views on whether its advice is being taken up.**

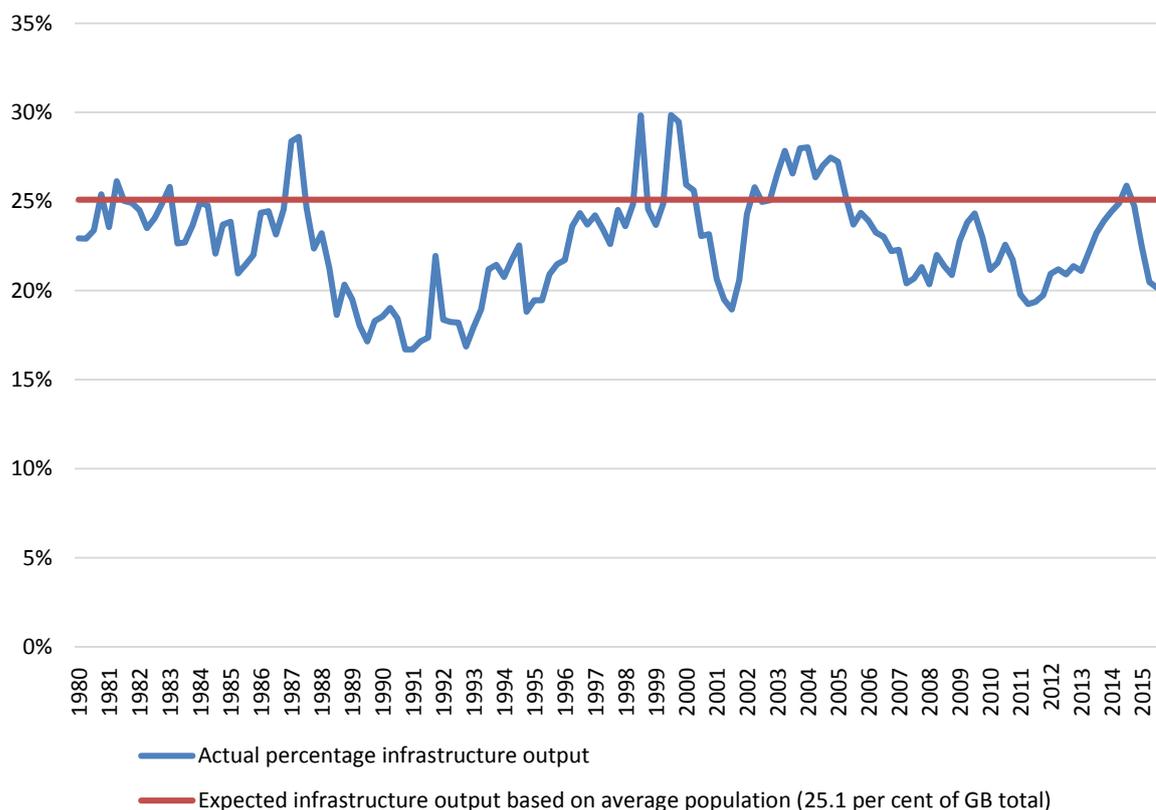

CECA response to the Call for Evidence

13. Much of the Call for Evidence focusses on issues related to strategic planning for infrastructure. While our members have an interest in these issues, we do not collect evidence that would be useful to support the Commission in these areas. As such, we have limited our initial response to those areas where we feel we can provide useful views from industry.

Improving connectivity between cities in the North of England

14. Our members have a dual interest in the issues of connectivity in the North of England. Members of our regional associations in North East, North West and Yorkshire & Humberside not only deliver an estimated 70 per cent of all transport infrastructure construction work in the North of England, but are also extensive users of the networks. As such, they have extensive experience of the challenges of connectivity between northern cities.
15. These companies recognise that the North of England has historically seen a lower level of investment in its infrastructure than elsewhere in the UK. The difference is particularly acute when comparing investment in northern England with that in the South East and London.

Northern infrastructure output as percentage of GB infrastructure output

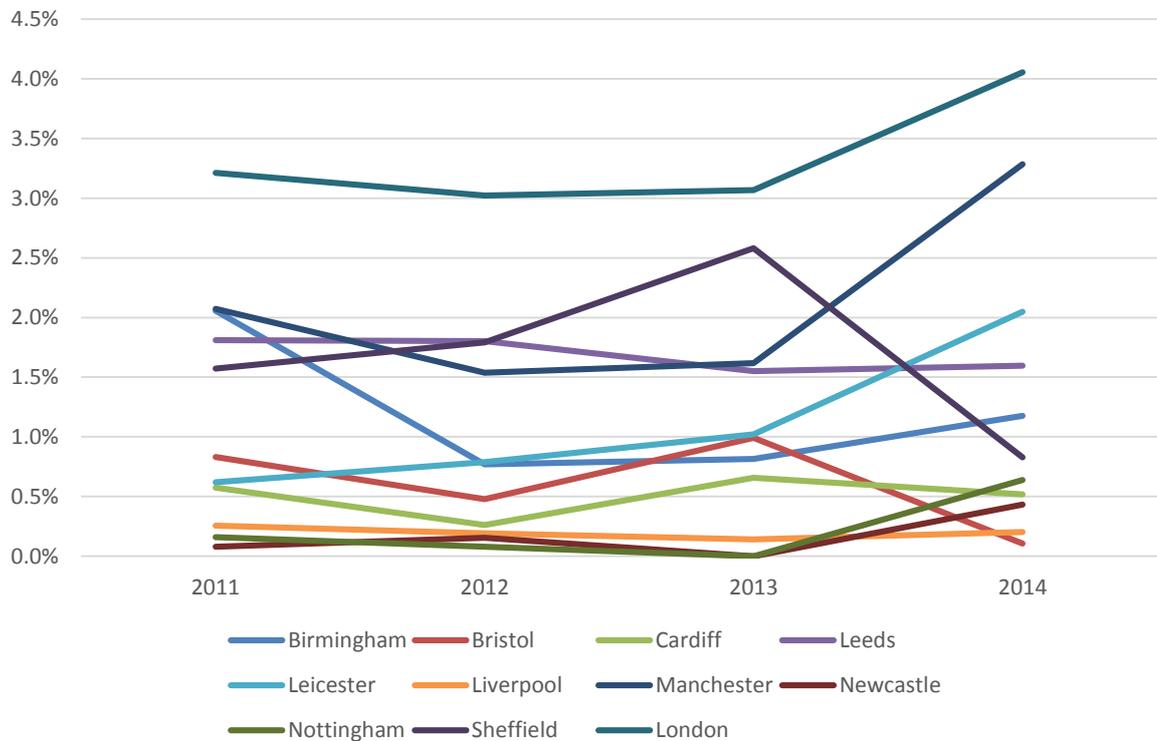

16. The graph on the previous page illustrates this issue. It shows that since the Office of National Statistics started collecting output figures for infrastructure in 1980, regional breakdown of the data shows that the North of England (North East, North West and Yorkshire & Humberside) has largely seen lower levels of output in infrastructure than would be expected based on its 25.1 per cent average share of the GB population.
17. There are many strong arguments why this may be the case. While many of the UK's largest cities are in the North, the most populous regions of the UK are the South East and London. This large and growing population creates additional pressure on infrastructure networks, necessitating investment to maintain network capacity and availability.
18. We see evidence of this in the levels of congestion on roads in London and the South East compared with the rest of the country. According to Department for Transport figures¹, 17 of the 20 local authority areas with the greatest delays due to congestion are in London and the South East.
19. Similarly, official figures² show that London experiences more overcrowding on its trains than any of the northern cities (although the most recent figures for Manchester suggest that it is starting to experience similar levels of congestion).

¹ Department for Transport - *Average journey times during the weekday morning peak on locally managed 'A' roads: by local authority in England, annual averages from 2006/07*

² Department for Transport - *Passengers in excess of capacity (PiXC) on a typical autumn weekday by city: annual from 2011*

Passengers in excess of capacity on a typical autumn weekday by city: annual from 2011

20. The economic geography of the UK also means that the business cases for investment in London and the South East are stronger, as assessments are built (in part) on the basis of economic impacts of investment on business users and private sector providers. The higher economic output of London and the South East therefore strengthens the economic case for investment as 'higher value' impacts will be achieved.
21. However, these factors create a self-sustaining vicious circle, with investment in housing and industry 'sticking' in London and the South East. This creates a more unstable economy in the region with rising population and increasingly costly infrastructure to mitigate the congestion this creates.
22. As we will discuss later in this paper, we do not believe that the response to this should be to transfer transport investment away from London. The factors that underpin London's rapidly rising population will take time to resolve, and it would be dangerous to remove the investment that ensures that the capital's transport networks can continue to function.
23. But we equally recognise that some of the pressure on London could be relieved if cities outside London, including those in northern England, offered the factors that currently attract people and investors to London. In doing so, they could draw people away from London, while stimulating more balanced economic growth across the country.
24. It is very clear that appropriate investment in transport is one of the most effective mechanisms to boost economic activity in a region. Our report *Securing our Economy: the Case for Infrastructure* found that for each £1 billion increase in infrastructure investment, UK-wide GDP increases by a total £1.299 billion. Furthermore, for every

£1 billion of infrastructure construction increases overall economic activity by £2.842 billion.

25. Importantly, investment in infrastructure boosts job creation. The same report found that for every 100 jobs created during the construction of infrastructure, a total of 305 jobs are created in the economy as a whole. There is also strong evidence of a link between infrastructure investment and the development of new housing.
26. **For the above reasons, we believe that the Commission may wish to consider whether future transport investment appraisal may put additional weight on the ‘rebalancing’ impacts that can be achieved through investment outside London. This should not be seen as a political fix to move investment towards the North (although it may drive a ‘fairer’ balance of investment across the country in the future). Instead, it is a way to give greater recognition to the rising costs to the wider UK of an overheating economy in London and the South East, while still expecting each project to demonstrate the value that it creates.**
27. We believe that part of the challenge for the northern cities in terms of their ability to present credible cases for transport investment arises as a result of a lack of coordination. Historically these cities have tended to compete for resources rather than collaborate effectively. As such, they have not had the ‘firepower’ to present a consistent vision for their needs, in a way that London has been able to.

28. For this reason, we have welcomed the development of Transport for the North (TfN). We believe that it has the potential to develop a credible vision for the future of transport in, and between, the major cities of northern England. If it functions effectively, it should be the best positioned body to analyse and determine what the most appropriate major transport interventions should be across the North of England, and build a credible case for how they should be delivered. But in order to do so, it is vital the TfN is provided with the appropriate level of resources to discharge this role.
29. To this end we would wish to see strong leadership and authority from the newly established TfN. Clarity must be given as soon as possible on the role of TfN and how it will interact with other regional transport bodies including Transport for Greater Manchester in this work.
30. Part of this work will necessitate TfN to consider how future investment will be funded. While we would anticipate that existing funding streams would continue or be replaced, this will not be sufficient to cover the full cost of delivering the TfN vision.
31. To ensure that resource constraints do not hold back delivery of this vision, we believe that TfN should build on the successful funding model for Crossrail. The large scale of Crossrail meant that it could dig deeper into who the beneficiaries were for the project, and therefore more closely tie the funding for the work to those who would see the greatest benefit. As a result, Crossrail's funding was drawn from a wide range of stakeholders including major companies (Heathrow, Berkeley Homes), wider industry (Business Rate Supplement), and the tax payer (DfT and GLA/TfL) with each paying a fair contribution based on the benefits they would realise from the project.
32. **As such, we recommend that TfN be given the freedom to consider a programme-level 'northern transport deal' that would look at the full range of beneficiaries from the plans, developing a mechanism that seeks contributions based on all stakeholders making a fair contribution based on the benefits that they will see from the programme being delivered. This model will also have the additional benefit of confirming the support of the population of the North of England for TfN's plans.**
33. CECA members are increasingly concerned about the deterioration of local roads in northern England due to decreasing local maintenance spend. The majority of vehicle journeys begin on local roads, and it is vital that these too are well maintained to ensure efficient journeys across national networks. There is an ever increasing backlog of local maintenance work which we believe must trigger an urgent rethink of the way repairs are funded.
34. To ensure there is enough money for highways maintenance alongside other major infrastructure projects, we propose wider use of prudential borrowing, while consideration should also be given to private finance models and the targeted use of local authority reserves.
35. We also feel that there are lessons from the water sector's transition from CAPEX to TOTEX spend, with greater consideration of the best way to invest to achieve outcomes, rather than purely looking at capital solutions.

London's transport infrastructure

36. As noted in our response above, we see transport congestion as a fundamental and enduring challenge to the future of London. This is not only a problem of London's future but one of its present, with increasing challenges associated with the use of the capital's road and rail networks. Already some of London's stations are overcrowded to the point that they are not accessible at certain times during the day, while commuters are unable to board some trains into the city at peak times. The capital's roads congestion is not only the worst in the UK, but is also higher than any other city in Europe³.
37. For this reason, as noted above, we believe that there needs to be a twin approach to resolving these issues. The first priority must be to ensure that demand continues to be met. This will require sustained investment in all of London's transport networks. However we also see the need to develop a strategic approach to divert population growth away from the capital by presenting viable opportunities elsewhere in the UK.
38. **We recommend that the Commission seeks evidence of the factors that are underpinning London's continuing economic growth. This evidence should then be analysed to consider how these factors might be replicated elsewhere, while using appropriate demand management to ensure that London's future population growth is better matched to its ability to respond.**
39. When looking at the specific large scale transport improvements that are required in London, we believe that decisions on which options to take forward should be based on which will deliver the best outcomes for London and the UK as a whole.
40. On this basis, the case for the delivery of Crossrail 2 seems very strong. The route targets an alignment that will tackle some of the most pressing congestion hotspots on the existing rail network, while also opening up significant tracts of land in north east London for the development of the housing that will be required to meet London's growing population, even if efforts to divert some population growth away from the capital are successful.
41. While recognising that the project will require significant upfront development funding, we understand that Transport for London forecasts that delivery of the project will largely pay for itself through a similar funding model to Crossrail, with those in the capital who will benefit from the project being asked to contribute towards its cost.
42. Through the recent/current delivery of Crossrail, Thames Tideway Tunnel and Northern Line Extension, London has developed a sustained pipeline of major tunnelling projects with continuity of workload for the sector. We anticipate that this pipeline will extend into the near future with works to deliver HS2 and the Silvertown Crossing.
43. However, there is a risk that the expertise that has built up in the UK may be lost if Crossrail 2 does not proceed. This would have negative consequences for the UK's

³ Europe's most congested cities in 2014 (ranked by annual hours wasted):
<http://inrix.com/press/scorecard-report-united-kingdom/>

ability to sustain this trained workforce to efficiently deliver other future tunnelling projects.

44. We also believe that there are significant opportunities to increase the benefits and reduce the costs Crossrail 2. Experience from many previous large infrastructure projects shows that many of the opportunities for efficiency and additional benefit are constrained due to decisions made at the earliest stages of development. Choices around the route, access and broad construction methodology tend to be taken early in the project life cycle, yet these can have significant downstream impact.
45. The companies who are involved in the delivery of infrastructure will tend to have the best understanding of where these opportunities lie. However, the pressures of existing procurement regulation mean that project developers often find it difficult to engage suppliers early to seek advice, for fear of falling foul of rules intended to avoid later conflicts of interest.
46. We believe that the revised EU procurement regulations give greater clarity that such early engagement is acceptable, with appropriate safeguards.
47. **As such, we believe that Crossrail 2 should be used as an exemplar of what can be achieved by appropriate early involvement of the supply chain in the development phase. Our engagement with members indicate that such activity could reasonably be expected to deliver at least 20 per cent savings against typical costs for a more traditional approach.**
48. We believe that this engagement could be achieved through ‘ultra-early’ appointment of suppliers to work on the scheme right through from early development through to delivery. However, recognising that this may be perceived as closing out options for competition for the delivery phase, we also see options for appointing an independent panel of advisors, drawn from industry, who would provide buildability advice to Crossrail 2 Ltd. Such advisors could be appointed from a panel of volunteers that would be seconded from industry, selected for their specific expertise around a given issue, and paid on a consultancy basis via a standalone body to remove any issues around conflict of interest. This would allow Crossrail 2 Ltd to benefit from the insight that could release the cost savings outlined above, while avoiding any concerns that advice from individual supply chain companies could see those companies barred from bidding for future work.

**Community
Transport
Association**

Response to the

National Infrastructure Commission Call for Evidence

Closing Date: 08/01/2016

The Community Transport Association

The Community Transport Association

The Community Transport Association is the national body working with the providers of community transport helping them to remain relevant and responsive to key areas of public policy and make a big difference for people and families in the communities they work in. These are typically charities and voluntary groups rooted in their own local community.

The CTA is the UK's leading authority on the practice and performance of the UK's community transport sector and uses its research to gather insights and intelligence from local communities to inform the development of public policy.

We are for, and about, accessible and inclusive transport.

We work with people who all want the very best for their communities and see accessible and inclusive transport as part of the answer to the big questions about how we are all to live, learn, work, participate and belong.

We work for a better world where individuals are able to design their own ground-up transport solutions, placing accessibility and inclusivity centre-stage in a way that nobody else ever has.

Community transport

In all parts of the UK, on every day of the year - including Christmas Day – thousands of community transport staff and volunteers are helping people to stay independent, participate in their communities and to access vital services and employment.

Community transport is about providing flexible and accessible community-led solutions in response to unmet local transport needs, and often represents the only means of transport for many vulnerable and isolated people. Significant user groups are older people and disabled people.

Using everything from mopeds to minibuses, typical services include voluntary car schemes, community bus services, school transport, hospital transport, dial-a-ride, wheels to work and group hire services. Most services are demand-responsive, taking people from door to door, but a growing number are offering scheduled services along fixed routes where conventional bus services are not available, especially in rural areas.

As community transport works to a different business model to commercial passenger transport services - i.e. it is always run for a social purpose and community benefit, but never for a profit - it often a more reliable and resilient way of ensuring a broader range of transport needs can be met.

Whilst the journeys community transport delivers account for a small proportion of the total passenger journeys made every year by the public, their significance in improving the lives of the people who use these services is remarkable.

CTA's Response to the Consultation

The CTA welcomes the opportunity to contribute to the Infrastructure Commission consultation process.

Community transport in all its forms, has the potential to offer a more reliable and resilient way of addressing a growing number of transport needs and accessibility issues. The possibilities are immense. Services that are needs-led, community-run, not-for profit, highly collaborative with high levels of volunteer involvement are all getting a good hearing in the debates about building better and more sustainable transport which is accessible and inclusive. It makes sense that the Infrastructure Commission should also want to hear about and consider the contribution of this vital, but often low-profile, part of the transport network.

In responding to the Commission we have structured our response around the relevant questions in the consultation document. Where possible footnotes are provided that point to further evidence for consideration. This response refers to the heading "For future investment in the north's transport infrastructure." In addition we have also made some general comments in relation to section 3 on London's Transport Infrastructure which mirror some of our conclusions on the role of community transport in connecting northern cities.

To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?

Weaknesses in transport connectivity

- 1 Different stakeholders will view 'weaknesses' through different lenses. At the Community Transport Association we believe transport systems are weaker when:
- 2 The needs of vulnerable and isolated people and communities have not been at the forefront when public services and infrastructure have been designed. This includes older people, disabled people, those with long-term conditions, those living in social isolation and those who cannot access employment, education or training.
- 3 The system focusses solely on private car use and mainstream public transport and does not recognise and include activity from the ground up - community-led transport solutions and the local sharing economy. Not owning a car should not be a barrier to achievement or aspiration.
- 4 The result of these weaknesses is poor integration across and within different modes of transport with a lack of connectivity which, amongst other things, does not reconcile unused capacity with unmet needs.
- 5 The CTA's vision is of a more integrated transport network built from the ground up. The CTA believes the UK Government deserves a good hearing on its ideas for devolving more decisions about local transport and we welcome the moves by transport authorities and public bodies across the north to embrace the opportunities this may present.
- 6 However, we also know that many organisations are finding it hard to listen when faced with the reality of cuts to local government funding. The impact on the number and reach of bus services as a result of reductions in public spending have been well documented by organisations such as the Campaign for Better Transport.
- 7 As good transport links have a demonstrably positive link with employment we are worried that poor bus infrastructure will prevent many communities, particularly those in rural areas, from both supporting, and benefiting from economic growth. It is usually poorer people who are the most dependent on bus travel. Therefore there is a real danger that social isolation could quickly be translated into economic isolation for people who live in northern rural communities. Furthermore, as job seekers are dependent on effective infrastructure we believe that transport connectivity is vital for encouraging economic growth within northern city regions.

Social and economic benefits of community transport

- 8 We believe the social and economic benefits of community transport means that community transport should be considered integral to the debate about on how connectivity can drive economic growth.
- 9 Many community transport operators support local businesses through enabling people to access retail and other services on the high street. New research published in January 2016 estimated that for every pound invested by Devon County Council on community transport; almost £9 is spent in the local economy; with community transport services users spending an estimated £2.2 million in Devon high streets each year.
- 10 Councillor Stuart Hughes, Devon County Council Cabinet Member for Highway Management, in welcoming these figures said “Community transport is extremely important in Devon in helping people to maintain their independence and continue living at home. It provides a lifeline to those who may otherwise be isolated and, as these figures show, it is also important in supporting the local economy. Community transport... helps people who find it hard to get around to access their local shops and other services. The benefits to our local market and coastal towns are clear, and the success of community transport is thanks to the dedicated staff and volunteers.”
- 11 Community transport operators provide direct employment and opportunities for volunteers, which can enhance their chances of entering employment and reducing social security costs. Volunteers within community transport also benefit from social interaction that they may not otherwise get and provide a net economic benefit to society when the value of their time and contribution is monetised.
- 12 Poor access to private and public transport is a common labour market barrier for many young people. Community transport operators help them through initiatives such as Wheels to Work. South Yorkshire Wheels to Work has helped more than 500 people over three years to get to work, training or college through lending them a scooter and safety equipment and providing them with training.
- 13 Another example of a bespoke local service that addresses labour market barriers was set up by Ilfracombe and District Community Transport from Job Centre Plus. Local employers in the hospitality sector were having difficulty recruiting due to the lack of public transport in the evening. The community transport operator set up a late night minibus service running seven nights a week, picking up from several premises in the local area in order to take employees back to their homes in Ilfracombe.
- 14 In addition to investment in community leading to economic growth and job creation it can also lead to savings being made to the public purse by reducing spend in other areas.

- 15 Community transport services are of significant importance in supporting personal independence and tackling isolation. By supporting people to access vital services and social networks they enable them to stay in their own home which reduces the likelihood that they will need more costly publicly-funded care.
- 16 Community transport offers a wide range of benefits to local authorities and other public bodies. They are often less costly than their commercial equivalents and offer alternative solutions when conventional and subsidised bus services are withdrawn or are not viable, especially in rural communities.
- 17 Community transport operators will also often create value for some public services that have not had to make a financial contribution to receive those benefits. An example is in health, where the CTA survey of operators in England in 2014 found that 74 per cent of operators were enabling people to access health services, but only 24 per cent received any funding from the health bodies benefiting from this.

Improving transport connectivity

18. In improving transport connectivity within city regions we believe a number of actions regarding infrastructure are necessary. The first is that we believe local people should be given a greater role in shaping local transport that works for them. It is our belief that local infrastructure can only be improved through giving local authorities the power to develop integrated transport systems that include community transport from the outset. We believe that more has to be done to encourage more collaboration between the private sector and community transport operators, as a lack of collaboration leads to poor connectivity, inefficiencies and underused capacity in the system. We would contend that even though many mainstream public transport services have improved their inclusivity and accessibility in a meaningful and measurable way attention still needs to be given to all parts of the door to door journey. If people cannot get from their front door to the accessible train station because the first part of their journey cannot be made then the high profile measures taken to improve accessibility in public transport will not have fulfilled their promise or potential.
19. Looking at connectivity between northern city regions we know that poor access to private and public transport is a common market barrier for many young people. It has to be a particular concern that local authority cuts may make it impossible to simultaneously build affordable housing, and support effective transport, further decreasing mobility for many people. Community transport operations have a positive economic impact on city regions¹, and we believe that for this benefit to be felt between city regions it is necessary to consider how transport is regulated between city regions. We believe that regulation

¹<http://www.ctauk.org/UserFiles/Documents/In%20Your%20Area/England/State%20of%20the%20Sector%20for%20inhouse%20print.pdf>

needs to be proportionate to better recognise providers who work across town and city borders.

20. Fundamentally, capital infrastructure investment needs to ensure passengers are able to traverse the transport network by a range of different transport modes. Key to achieving this is investment in an intergraded transport system that uses accessible and integrated information technologies. Furthermore, any capital investment in infrastructure needs a revenue commitment to underwrite it, as Local Authorities continue to reduce bus subsidies this is likely to necessitate the need for partnerships with external transport providers.

What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.

21. In developing city-to-city connectivity we believe it is right that the commission looks at transport holistically, rather than individual services. It is our belief that it is necessary to significantly invest in public transport solutions that incorporate passenger preferences toward multi-modal, and integrated transport solutions. As transport consultants Frost and Sullivan point out this vision of increased public transport use is:
22. “realised by a convergence of four main mega trends that are being continually tracked by Frost & Sullivan research teams – urbanisation leading to an increasing population density and potential for new mobility business models, social preference changes, rapidly advancing technological developments revolutionising mobility, and smart governance to enable the legislative framework for social innovation in transport to flourish.”²
23. It is our belief that a cost-effective means of ensuring city-to-city connectivity is ensuring travel permits cover a broad geographical area, and a number of services. Clearly, if travel permits include trains, buses, and community transport operators people have a greater opportunity for a lower economic cost to travel between cities. As mentioned above investment in transport shows a generous economic reward to towns and cities and as such would be a cost-effective way to increase city-to-city connectivity.
24. The Chancellor has committed to building around 1,300 miles of additional road surfaces, as highlighted in our blog we believe that developing road infrastructure is important in increasing connections between cities³. It is a concern that the vast majority of transport infrastructure funding is being directed toward London, coupled with local authority cuts there is the possibility that northern cities will not see any improvement in city-to-city connectivity. In this light we believe that investment in better roads between northern cities is an obvious but important starting point. In addition to this we believe that there are benefits to providing financial encouragement for vehicles that carry multiple passengers to travel between cities.

² https://www.hitachi.eu/en/sib/whitepapers/downloads/whitepaper_002.pdf

³ <https://ctauk.wordpress.com/2015/11/30/autumn-statement-transport/>

25. Finally, it is important to consider digital infrastructure as integral to overall infrastructure investment. Personal devices are increasingly being used for planning journeys, buying tickets and providing users with flexible travel information. As these technologies advance it is necessary that digital infrastructure provides reliable, informative, and flexible travel information in order to optimise passenger travel experience.

What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?

26. We want to use the new impetus for greater integration arising from the Buses Bill to lead to the community having a greater say over what their local transport is like and, where they can, design their own transport solutions with accessibility and inclusivity built into them from the beginning.

27. We believe that governance arrangements should be responsive to the needs of vulnerable and isolated people and communities have not been always been at the forefront when public services and infrastructure have been designed. This includes older people, disabled people, those with long-term conditions, those living in social isolation, those who cannot access employment, education or training. As community transport operators have unrivalled insights into the broad range of needs and issues affecting these groups they would provide an ideal source of intelligence to inform the governance process and should be involved in it in some way.

28. In ensuring this can be achieved we believe that there should be a statutory duty on those charged with developing infrastructure in the north to ensure that community needs are considered from the design stage onwards.

London's Transport Infrastructure

29. Much of the discourse about transforming how transport is run in the north of England has been described as giving those areas "London-style powers". This is a reference to the perceived benefits for the public and passengers of the considerable powers Transport for London (TfL) to shape the transport system in the city region. Indeed, David McNeill, Director of Public Affairs and Stakeholder Engagement at TfL, spoke at length at our recent Westminster Conference about how London's experience with devolution and how its status as an integrated transport authority has enabled it to provide high quality and accessible transport for Londoners.
30. That said, we know that many people remain vulnerable and isolated with Greater London. Difficulties making the first or very last part of an entire journey might prevent them from ever benefitting from large-scale transport infrastructure improvements. Even if they can access the mainstream transport network over-crowding on some modes of transport makes it a daunting experience for some groups in the community.
31. We also know, however, that there is a vibrant community transport network across the capital filling gaps in mainstream services and meeting unmet needs and we know its work is understood and valued by TfL. Many of the social and economic benefits of ensuring community transport is part of the conversation about transport infrastructure, which we described in relation to the north of England, would also apply in Greater London. Indeed community transport operators in London have led the way in developing a robust methodology for demonstrating the social value of their services which will be published in January 2016.
32. The CTA would therefore wish to see these organisations with their unique insights into the lives and transport needs of vulnerable and isolated people fully included in the debate about economic and social challenges facing London to ensure that transport is as accessible and inclusive as it can be.

Sir Merrick Cockell
Chair of the Crossrail 2 Growth Commission
Crossrail 2
PO Box 72284
London
SW1P 9PB

17 December 2015

Dear Sir Merrick,

CBI London welcomes the opportunity to respond to the Crossrail 2 Growth Commission's consultation.

Across the UK, the CBI speaks on behalf of 190,000 businesses of all sizes and sectors which together employ nearly 7 million people, about one third of the private sector-employed workforce. In London, infrastructure investment is a key business issue and a recent CBI/ CBRE survey found London's transport infrastructure as the top priority for firms ahead of the mayoral 2016 election¹. In addition 94% of businesses see the quality of infrastructure as a decisive factor when planning future investment². Ensuring Crossrail 2 is developed so that it supports businesses as well as passengers creating homes, jobs and prosperity is therefore key.

The strategic role of Crossrail 2

Do you agree with the analysis of national/ regional economic trends which are integral to Crossrail 2's business case?

As some employees move further out of the city, reliable commuter routes to bring them into work are key

As some employees are forced to move further out of the capital due to rising housing costs, getting people from London's outer regions and from the wider country into London quickly and affordably is key. Increasing house prices are negatively impacting firms' ability to recruit and retain staff and the CBI/ CBRE London Business Survey found 32% of businesses saying that they are unable to offer flexible part-time employment due to the time/cost of the commute into London for employees who cannot afford to live locally. Similarly almost a third of firms said that employees are moving away from the local area and therefore having to leave their jobs as housing costs are too high. Transport connections are vital for commuters and Crossrail 2 will play an important role in facilitating these journeys.

Crossrail 2 needs to be viewed as a 'national' project

Highlighting the regional and national benefits of Crossrail 2 and ensuring the project supports the whole of the UK whether through transport links, jobs or supply chains is vital in getting public buy in to the project.

Crossrail 2 should be seen as a national project, supporting both the regions and the capital. Whilst the line will service greater London, it will also free up space on our national rail lines, indirectly supporting towns

¹ CBI/ CBRE London Business Survey 2015

² CBI/ AECOM Infrastructure Survey 2015

and cities such as Cambridge, Southampton and Woking. Crossrail 2 will also play a vital role in providing seamless connections from the new High Speed Rail line. 70% of high speed rail journeys will either start or end in London and so new infrastructure to support the influx of passengers will be vital.

The development of the line should benefit the regions through job creation and supply chains something that Crossrail was successful at doing.

Do you support a key objective of Crossrail 2, which is to ‘accommodate housing growth and regeneration across London and surrounding regions’?

Last year CBI London’s consultation response to the 2050 Infrastructure Plan argued that it was essential that our housing needs are incorporated into our wider infrastructure plans, with one of the key objectives of the plan being to unlock housing growth via infrastructure investment. Businesses cite ‘silo working’ as a key frustration and so we therefore welcome this objective of Crossrail 2 and would be keen to work with the commission to understand how we can accommodate housing growth and regeneration across London and surrounding regions. Almost 60% of businesses said that enhancing the housing offer including quality and affordability was a top priority for them ahead of the mayoral elections. Ensuring this Crossrail 2 helps to develop our housing offering is therefore key.

The local opportunities offered by Crossrail 2

To what extent is additional supporting infrastructure required to capitalise on the growth that Crossrail 2 could unlock?

As well as developing the new Crossrail 2 line, Transport for London must continue with investment across the wider tube network. Crossrail 2 will be just one line a commuter may use as part of a wider journey. We must ensure that journeys’ are seamless with a high quality user experience felt across the whole network. There will be little point having a good quality, fast Crossrail 2 if the onward tube connections are prone to signal failure, over-crowding and delays. Constant upgrades and developments must be factored in as a priority.

Resilient digital infrastructure and technology is key in supporting the opportunities that Crossrail 2 could provide

Investment in our digital infrastructure and ensuring our digital connectivity is resilient will be crucial ahead of the development of Crossrail 2. The successful running of these new trains will rely significantly on digital signalling. Ensuring we invest in good quality digital technology will therefore be fundamental to how well the new line operates.

Successful delivery and potential barriers

What potential do you think Crossrail 2 has to strengthen the employment market in your area of interest? Are any external factors needed to maximise Crossrail 2’s beneficial impacts?

Working with local leaders will ensure the project complements local growth strategies

The CBI has previously highlighted how national infrastructure projects must be integrated with local regeneration plans – this should apply to Crossrail 2 also. In order to get maximum bang for the buck that will be spent on Crossrail 2 we need to ensure that the project (local stations) are aligned with local priorities so that the full benefits are realised. It is vital that when choosing the location of stations, local council leaders are fully involved in the decision making process and can ensure that the plans will complement and enhance

growth strategies for the area. This will ensure that housing, jobs and growth will go hand in hand with the new station locations.

Crossrail 2 has the potential to boost local skills

Crossrail 2 has a key educational role to play in the local areas that it will impact. A concerted effort is required from businesses, government and other stakeholders to foster a long term culture of skills development to maintain progress towards Construction 2025, the industrial strategy for the sector. Many firms tell us their concerns regarding a lack of a talent pipeline in the sector. Crossrail 2 can help to encourage the future work-force by engaging them throughout its development.

Using digital connectivity to boost user experience

As route plans are made for the new line, Crossrail 2 must also outline how they plan to utilise 'smart' technology to boost user experience and passenger satisfaction. Smart technology has the ability to join up transport journeys with other transport suppliers and will enable real time information for passengers to make informed journey decisions. Not only would this help to improve journey experience, but it could also help reduce congestion across the network.

What are the most significant barriers to achieving any additional development opportunities that might come forward as a result of Crossrail 2?

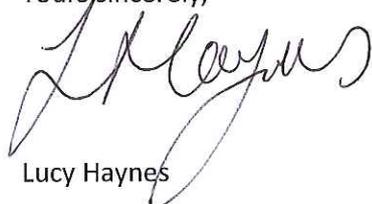

Joined up working is key to the development and success of this project. The Greater London Authority and Transport for London must engage early on with local stakeholders, businesses and local people to understand the additional development opportunities that might come forward as a result of the project.

A lack of investment in our digital connections will also negatively impact on the project. Ensuring we have quality and reliable digital signalling for the trains to operate effectively will be key.

CBI London would be delighted to discuss any of these points with the commission in greater detail.

Thank you for the opportunity to feed into the review,

Yours sincerely,

Lucy Haynes

CBI Director, London

Introduction

1. The County Councils Network (CCN) represents 37 English local councils that serve counties. CCN membership includes both upper tier and unitary councils who together serve over 25 million people across 86% of England. CCN develops policy, shares best practice and makes representations to government on behalf of this significant proportion of the country. CCN is a member-led organisation which works on all party basis and seeks to make representations which can be supported by all member councils. CCN welcomes the opportunity to respond to the consultation, and would also direct the National Infrastructure Commission (the Commission) to the responses submitted by our individual member authorities.
2. CCN councils account for 41% of England's GVA, a combined output of £527bn. Reflecting this county areas are also the nation's most significant contributors to the Treasury. County economies represent a very healthy mix of occupations – they have above average levels of skilled trades, managers and senior officials and private sector employment. Additionally the largest proportion of active enterprises in the country can be found in counties, the total number of which currently amounting to well over a million. To ensure that these opportunities are maximised we argue that the National Infrastructure Commission (the Commission) and government must work with county areas, alongside cities, to develop national infrastructure strategy and secure investment.
3. Within this submission CCN express our disappointment that the work of the Commission, leading into the 2016 Budget, will focus on London and big city regions. We set out a number of recommendations which would give a broader basis for the work of the Commission, to ensure that vital economic opportunities presented by county areas play a key role in national strategy.

The remit of the Commission – investing in counties and cities

4. Ensuring the right strategic infrastructure is in place will be key to the future economic health and competitiveness of the country. CCN therefore welcome the formation of the independent National Infrastructure Commission (the Commission) as a permanent statutory body. Government has an important role, working with local areas, to prioritise nationally important schemes, make capital available, encourage private and international investment and enable areas to raise investment in innovative ways.
5. The overarching role of the Commission is described as carrying out 'independent and unbiased assessments of the UK's long-term infrastructure needs ... to give clear strategic direction to industry and government and provide a firm basis for planning and investment.' The Chancellor has asked that the Commission undertake this role through five yearly National Infrastructure Assessments (NIA). In support of the first NIA the Chancellor has asked the Commission to propose some initial schemes for in-depth analysis in early 2016.
6. CCN welcome the introduction of NIAs, as they should ensure greater certainty for private investors, and provide greater assurance to local authorities and the development industry that

growth is deliverable in a sustainable manner, supported by existing and planned infrastructure. **We strongly suggest that the Commission thoroughly engage with the robust and evidence based priorities of counties in drawing up their NIA, and in making initial proposals for in-depth analysis in early 2016. CCN would be happy to facilitate and support such engagement.**

7. Additionally the Chancellor has written to Lord Adonis, Interim Chairman of the Commission, explaining that the Commission should concentrate its initial focus on three key areas; northern connectivity, London's transport infrastructure, and energy. As these are considered by central government to be the most pressing for the national economy, and these initial investigations will influence the 2016 budget. The Chancellor has issued the Commission detailed terms of reference for these first three projects.
8. CCN would like to express their disappointment that the work of the Commission has been so limited in the scope of its initial investigations, which will inform investment and priorities of the 2016 Budget. These initial inquiries focus entirely on London and the northern cities, without any regard to the rest of the country, except through references to 'commuter hinterland'.
9. We suggest that limiting the scope of these inquiries in such a way is not in the best interests of unbiased assessment of the UK's long-term infrastructure needs. We argue that strategic infrastructure investment is as pressing in county areas as it is city areas, that cities and counties function together, and that county regions represent substantial economic opportunities which must not be overlooked. These points are explained in further detail through this submission.
10. To address these points **we strongly recommend that the Commission takes a comprehensive, country-wide approach in making recommendations through its initial investigations, to inform the 2016 Budget. We urge the Commission to carefully consider the evidence put forward by CCN members to these initial inquiries, and broader evidence established through Strategic Economic Plans and other mediums to help inform this.**
11. **We also suggest that the Commission commit now to undertaking specific detailed inquiries into investment in county infrastructure as part of its next tranche of analysis and recommendations.**

Achieving our shared devolution goals

12. CCN share government's goals to devolve functions and financial freedoms, to bring decisions closer to the people and business they affect and to stimulate economic growth. To support this we must ensure that the Commission takes a localist approach and does not inadvertently centralise powers and decisions. Equally we must ensure that the work of the Commission and of government considers the economic opportunities in all areas and does not disenfranchise swathes of the country.
13. We note that government consider regional transport partnerships / Sub-National Transport Bodies to be an important stakeholder in the work of the Commission. We believe that in principle this is supportive of the devolution agenda. For example we are pleased to note that in its inquiry into infrastructure in the north the Commission will work closely with Transport for the North (TfN) to establish and evaluate options for investment.

14. We are also pleased that Sub-national Transport Bodies will involve joint decision making between the local elected representatives and businesses, the Department for Transport, Highways England and National Rail. These factors represent meaningful devolution and public service reform, which we hope will evolve over time.
15. To ensure that the best value is derived from these approaches **we strongly suggest that where counties wish to be a part of regional transport partnerships / Sub-national Transport Bodies they are encouraged to do so, and that government publically commits to promoting and listening to the important voice of counties alongside cities within these arrangements.**
16. In summer 2015 the Chancellor stated that TfN would be underpinned by 'devolving far reaching powers over transport to the North's Mayor-led city regions to deliver fully integrated public transport systems'. We must evolve this approach and ensure that the important economic and logistical hubs represented by counties are equally empowered, and able to contribute to regional growth. **We strongly suggest that transport and growth powers and budgets are devolved to counties where there are rigorous and appropriate governance measures in place and without a pre-requisite for metro mayors.**
17. In this context we are pleased that there has been a broadening of the membership of the TfN Partnership Board in recently months, beyond a city region focus to involve more county partners in the area. We would expect to see the role and voice of counties in such arrangements to growth over time, and would expect the Commission to fully consider the views of counties in its engagement with Sub-national Transport Bodies and individual areas.
18. **Where formal regional transport partnerships / Sub-national Transport Bodies are not in place, we still suggest that the Commission strive to engage groupings of local areas to help establish and appraise investment options put forward to government. CCN would be happy to facilitate such an approach.**

Counties role in sub-national transport and infrastructure governance

19. Counties are ready to take a lead role in driving sub-national transport and infrastructure, with local, national and international partners. Beyond the TfN example above counties have also been heavily involved with their city partners in the creation of Midlands Connect. This initiative has been promoted by Ministers and the Chancellor as a vital aspect of the 'Midlands Engine' for growth. We believe that Midlands Connect will play a key role in the infrastructure, transport and growth of the area, and would expect the Commission to engage with the board, in the same way they will engage with TfN.
20. Elsewhere in the country counties have come together to found England's Economic Heartland partnership. It is intended that this partnership will drive innovation in the area, as well as effective transport and infrastructure strategy. Forums such as this would be the logical point of contact for the Commission going forward, and help ensure that infrastructure opportunities from all parts of the country are considered.
21. In response to the national infrastructure, Sub-national Transport Body and devolution agendas more groupings of counties, counties and cities, or large county areas may begin to formalise sub-national transport arrangements. We must ensure that a one size fits all approach is avoided and that all areas have the chance to take on powers and influence national strategy.

The importance of county economies

22. To give a sense of scale, counties cover 86% of the landmass of England, they represent 47% of the country's population and are responsible for 70% of maintained roads. The combined population of counties now stands at 25.5m, and has grown 2.6% between 2010 and 2014, compared to 2.5% in metropolitan boroughs. It is estimated there are 10.6m households in CCN member councils, which is projected to rise 18% to 12.8m by 2037.
23. Using the latest data (2013) the economies of the areas served by the 37 CCN councils accounted for 41% of England's GVA, up 1% from the previous year, with a combined GVA of £527bn. This is strong performance compared to other areas of England. Further analysis of GVA growth since the recession shows that outside of London counties have seen the largest growth - 36% of GVA growth compared to 13% in the Core Cities. Equally county areas are the nation's most significant contributors to the Treasury. The latest breakdown of income tax receipts show that county populations contributed £66.4bn, which is 49% of all income tax in England and contributed 41% of all residential stamp duty.
24. County economies represent a very healthy mix of occupations – they have the highest levels of skilled trades in the country, above average levels of managers and senior officials and are only behind London for levels of technical jobs. Outside of London CCN members also have the highest levels of private sector jobs, and in counties the proportion of private to public sector jobs is steadily growing over time.
25. Additionally the largest proportion of active enterprises in the country can be found in counties, the total number of which currently amounting to well over a million. Outside of London counties hold by far the largest number of businesses created per 10,000 of population. There are countless FTSE 100 company headquarters based in county areas, to name a handful BAE Systems in Hampshire, National Grid in Warwickshire, Next in Leicestershire and Experian in Nottinghamshire.¹ Underlining this the Independent Commission for Non-metropolitan England stated 'Internationally mobile firms overwhelmingly choose non-metropolitan areas, not conurbations, as their base if they don't choose London'.
26. We argue that securing the national economy must take a broader view than simply connecting city regions together. Evidence is showing that county regions are growing faster than city regions and that the scale of business undertaken in counties is substantial. Equally evidence is showing that county areas are some of the most innovative² and that specialisation can be equally, if not more, successful outside of big city areas.³ We must ensure that infrastructure links cities and counties across sub-national areas and that business and commuting links for counties are built into infrastructure plans.
27. Rural areas, the majority of which can be found in counties, are set to become ever more important to the national economy according to DEFRA. A report of late 2014 found a net migration from urban to rural areas in England, stating 'whilst in many OECD countries there has been a trend towards greater urbanisation, the UK has been experiencing net migration from urban to rural areas'. This strengthening of the rural economy is associated with innovation, knowledge-based industries and a strong entrepreneurial make up. DEFRA conclude 'if harnessed, these trends could help drive significant growth in productivity, employment and output ... for the UK economy' and 'could offset aging demographics ... in such areas'.⁴

¹ The Independent Commission for Non-metropolitan England, Devolution to Non-metropolitan England : Seven steps to growth and prosperity, Final Report of the Non-metropolitan Commission, March 2015

² DEFRA, How increased connectivity is boosting economic prospects of rural areas, December 2014

³ Respublica, The Missing Multipliers: Devolution to Britain's Key Cities, September 2014

⁴ DEFRA, How increased connectivity is boosting economic prospects of rural areas, December 2014

28. Echoing these points the Independent Commission for Non-metropolitan England stated that 'non-metropolitan areas' high skills base positions them well for a world where trade is increasingly blurring the line between goods and services. They have an edge in knowledge intensive sectors, where getting people around the globe easily can be as important as moving goods ... Future transport investment decisions will be informed by local and global connectivity, including the role of regional airports in accessing global markets'.⁵
29. Many ports, freight routes, airports and logistical hubs sit within counties. These gateways to international markets must play a central role to infrastructure strategy and not just an afterthought as means of moving goods in and out of cities. Logistical hubs and routes present important economic opportunities in their vicinity, alongside their broader reach.
30. Alongside cities English counties have strong identities, commodities and brands which attract international attention. This is borne out by the number of FTSE 100 companies based in county areas, but has huge potential to continue to grow. Counties are iconic to British life and business; they represent the land and the mix of business and lifestyle opportunities which are attracting big business. They have the high value skills base and growing track record of innovation and specialisation to service start-up, growing and international business – we must ensure that physical and digital infrastructure keeps pace with this and helps the nation grow.

Capacity for improved productivity and growth

31. Despite counties' strong and vibrant economies delivering growth, employment and taxes for UK Plc, productivity remains a long-term weakness. Figures for counties show that their average productivity is 91, compared to the UK 100 Index. This is considerably below the London average of 122, and also the Core Cities average of 94.
32. A key factor in addressing this productivity gap is the right strategic infrastructure interventions. With this in mind central government and the Commission should work with county areas to secure investment in infrastructure priorities and devolve growth, infrastructure and transport powers. CCN have calculated that if counties were enabled to raise their productivity to the national average, this could contribute an additional £100bn to the UK economy.

The ability of local areas to invest in infrastructure

33. Alongside the devolution of transport, infrastructure and growth powers and budgets mentioned earlier in this submission CCN strongly suggest that national and sub-national growth will be maximised by equipping all areas with the fiscal tools they need to invest in infrastructure.
34. Greater London, and now Greater Manchester are able to raise a region wide CIL to fund strategic infrastructure projects. Equally the Chancellor has proposed that those areas with a metro mayor are able to increase Business Rates. CCN strongly argue that such powers must be extended beyond big cities, and must not be arbitrarily connected to the mayoral model of governance. **We strongly suggest that county areas are equipped with a full suite of fiscal freedoms, so that their businesses and residents are able to decide what measures are put in place to invest in strategic infrastructure projects.**

8/1/16

To Whom It May Concern,

Please find below my submission to the National Infrastructure Commission's call for evidence in relation to London's Transport Infrastructure.

Yours sincerely,

Rt Hon David Lammy MP
Member of Parliament for Tottenham

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London faces a wide range of economic and social challenges like any metropolitan city. But there are three specific areas where the challenges are so great that urgent action is required.

HOUSING: The housing crisis has been well documented, yet since 2010 no politician has implemented real solutions, either at national or mayoral level. Shortage of supply, driven by very low levels of house building, plus soaring demand, mean that the average property in my Tottenham constituency now costs more than £350,000, with prices up almost seven per cent in the past year. This not only means that far too many people will be denied the dream of home ownership; as prices and rents rise ever higher, it will also start to damage London's economy, as workers from all sectors and at all skill levels are priced out of the city's Labour market.

ECONOMIC DEVELOPMENT: We also need economic development and new jobs in relatively deprived areas such as Tottenham. The prosperity of the City still masks the acute problems for some people in my part of north London. Economic development here and elsewhere in London within commuting distance and north into the Stansted-Cambridge corridor is essential.

TRANSPORT: Clearly the pressures of population growth on the transport network are closely related to both housing and economic development. In Tottenham, pressure on the Victoria line and on rail services lengthens commutes for my constituents, causes delays and makes their journeys more crowded and stressful. Better transport systems would drive growth and jobs, as well as unlocking

significant new housing development and importantly would greatly improve the quality of life for many of my hard working constituents.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

I write this consultation in my role as Chair of the All Party Parliamentary Group on Crossrail 2. London needs full funding of its transport network – not the latest round of cuts imposed by the Chancellor. We need proper funding guarantees for Tube upgrades, including the Piccadilly Line, which some people in the western part of my constituency depend on. We also need network rail to upgrade the West Anglia Main Line to improve capacity, resilience and frequency across the area.

However, such transport projects alone will not be enough. Even though Crossrail will add around 10 per cent to the capacity of London's transport network when it opens from late 2018, we need a similarly transformative project to cope with the increase in demand a decade and more beyond that. Crossrail 2 is the obvious answer, and indeed the only scheme currently proposed which delivers a similar step-change in capacity. We need to get moving on making Crossrail 2 a reality.

Infrastructure should enable growth, and therefore projects should be assessed on their ability to payback the original investment. Static assumptions about how a place will function in future have been debunked by the Jubilee Line extension which transformed Canary Wharf. Our assessments should focus instead on a project's ability to create jobs, grow the economy and generate new tax receipts, allowing us to develop a more realistic view of the benefits of infrastructure investment. This would support investment not just in London but in other cities around the UK too.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The benefits of Crossrail 2 could be maximised by the project working closely with the boroughs and with local communities to make sure that it helps deliver the kinds of increased numbers of homes – and jobs – that it is capable of. We need to strike a balance between preserving communities and allowing development which makes their futures viable in a London of 10 million people.

In addition, it is vital that while Crossrail 2 will inevitably cause disruption to communities while it is being constructed: we must listen carefully to the communities affected about the impact the disruption will have and respond to those concerns where possible.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Delivery of Crossrail 2 and other large projects in London needs first of all to be as speedy as possible. We can't afford to delay the project any longer: we just need to get moving. The transport network is already under strain and even on the most optimistic projections, Crossrail 2 will not be in operation for another 15 years. Starting construction as soon as possible will mean lower prices, avoiding costly construction inflation.

That delivery can be ensured in the first instance by awarding the scheme substantial development funds in order to complete technical development and get planning consents through Parliament

before 2020. The majority of the wider funding package is already predicted to come from London, including contributions from the business rate supplement and Community Infrastructure Levy. I would like to see this augmented by fair devolution of business rates, as signalled by the Chancellor this autumn, and by radical new measures such as, for instance, the hypothecation of Stamp Duty in the capital, or a portion of it, for London to spend on such projects. Infrastructure projects such as Crossrail 2 have the potential to make a huge contribution both to the UK economy and to Treasury revenues, and funding of them should reflect that.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

I would like to see Transport for London take a more aggressive approach to using the profits of development to fund transport improvements, on the lines of that taken by Hong Kong metro operator MTR. Developers along Crossrail's route, for example, have already made a killing: we should be capturing much more of that to fund the transport projects transforming property values. But we also need to take a more long-term view of transport investments, as for example Paris does. There, the ambitious Nouveau Grand Paris project for extension of metro and suburban rail lines has funding for decades into the future, allowing much better planning – and value for money – of this kind of fundamental investment in the city's future.

National Infrastructure Commission call for evidence

Connecting Northern Cities and London's Transport Infrastructure

Submission from DB Schenker Rail (UK) Limited

January 2016

1. This is the response of DB Schenker Rail (UK) Limited (DB Schenker) to the call for evidence issued by the National Infrastructure Commission (NIC) in November 2015.
2. DB Schenker is the largest rail freight operator in the UK and is a wholly owned subsidiary of Deutsche Bahn, the second largest mobility and Logistics Company in the world. DB Schenker operates over 5000 trains per month in the UK conveying everything from cereals to coal, consumer products to biomass, petroleum to steel and is the leading rail provider to the construction industry in the UK. DB Schenker employs over 3300 people in the UK providing freight, infrastructure, rail support and charter passenger services within the UK and freight services to and from continental Europe via the Channel Tunnel.
3. DB Schenker, in common with other rail freight operators, is a wholly private sector activity receiving no material direct government support in the UK. In a heavily-capital intensive industry, DB Schenker owns and operates its own assets, including depots and rolling stock, and has invested heavily in new locomotives, wagons and facilities since UK privatisation.
4. DB Schenker's response is in four parts – general observations about the value and characteristics of rail freight, a description of the current demand forecasts for rail freight, observations on current government policy and rail freight's specific infrastructure needs and how these relate to two of the three national challenges set out by the NIC.

Rail Freight

5. Rail freight is a wholly private sector activity determined by customer and market needs. In this respect it is different to passenger rail and rail freight has a very different, less direct, relationship with Governments, funders and other devolved bodies as a result.
6. Rail freight generates over £1.5bn of economic benefits for UK plc every year through a combination of improved productivity, reduced congestion and wider environmental benefits. It is vital for the competitiveness of the UK economy and is an intrinsic part of everyday life in the UK.
7. Rail freight transports goods worth over £30bn pa, moving over 25% of the containers entering the UK and underpinning industrial sectors such as power

generation, construction and steel. Rail is a key supplier to UK manufacturing sectors such as the automotive industry and a major supplier to Network Rail and other Infrastructure Managers.

8. Rail freight has transformed itself since privatisation in the mid-1990s into a competitive and vibrant industry, recognised by the CEO of the Office of Rail & Road as “the most transformed sector in the rail industry since privatisation”. Total volumes increased by over 80% from 13.5bn ntkms in 1995 to 24.4bn ntkms in 2013-14.
9. The sector is changing as the UK economic base itself shifts, with reductions in traditional rail freight markets such as moving coal to power stations - where Government environment and other policy choices are driving conversion to biomass, renewables and other forms of electricity generation. Alongside this is an increase in the volume of containers moved for the growing retail/consumer sectors.

Continued rail freight growth will increasingly focus on the retail, construction and international sectors reflecting the general change in patterns of the UK economy.

10. This will have geographical as well as sectorial implications, as the concentration of the UK’s population south of a line from the Humber to Lancashire means that this will become increasingly significant for rail freight. Ensuring sufficient usable rail capacity is available south of this line to allow rail to compete with road will be more complex than ever over the next decade.
11. Rail freight is an intensely competitive industry – both within the mode and with road transport in particular. This strong competition has driven efficiencies, lowered prices to customers and reduced the costs of operation. The drive for longer and heavier freight trains is one example of how this has been achieved. In the decade after 2002/3 the number of freight trains on the network reduced by over 33%, whilst volumes increased by 17% - this meant (taking distance into account) that each freight train increased its cargo carried by over 50%.

These pressures will continue and the sectors offering the most volume potential for future rail growth are also those with the strongest price and service competition with road transport.

12. Intrinsic to maintaining rail freight growth and development will be continued private sector investment. Investment in rolling stock and facilities by freight operating companies such as DB Schenker is clearly understood - over £2bn has been invested by FOCs since privatisation.

In addition over £500m has been invested by Government (including EU funding) in Control Period 4 on freight specific network enhancements. In addition, a further £230m has been planned for Control Period 5 freight specific network enhancements by the UK Government and Transport Scotland.

Freight customers and suppliers - including ports and terminal operators have also invested heavily in rail freight facilities - over £250m in the last decade on port-related rail infrastructure alone. Investment in new rail-connected warehousing and terminals is critical for future rail freight growth.

Ensuring the private sector has the confidence to continue to invest to support rail freight - and rail freight growth in particular - should be a key consideration.

13. Rail can move freight in greater volumes, more safely and reliably than road transport. Each freight train removes up to 75 HGVs from the UK's roads – without rail freight over 7.5m additional road journeys would have been needed. Transporting freight by rail reduces CO2 emissions by 76% compared to road.
14. Rail freight operates in *response* to specific customer demand - a key distinction from passenger where services are planned in *anticipation* of demand. Many trains are customer-specific rather than multi-customer - so if a customer does not require a service on a particular day or week it will neither be scheduled nor operated. Rail freight's use of capacity is therefore often very different to that of passenger operators.
15. Both railway and political devolution pose challenges for national activities such as rail freight – for example in how an appropriate balance will be made between local/regional and national requirements/priorities in ways that best support both regional and national economic activity and growth.

Freight Market Study and demand forecasts

16. In October 2013 Network Rail published a Freight Market Study (FMS) as part of its Long Term Planning Process that (inter alia) contained growth forecasts for 2023 and 2043. These suggested that further rail freight growth of 2.9% until 2043 was possible. Government accepted that these forecasts were robust and should be adopted for planning purposes.
17. Crucially these were an *unconstrained* set of forecasts - i.e. current or anticipated future constraints were not taken into account.
18. In reality the railway is already constrained in many locations –e.g. the Midland Main Line which Network Rail has formally declared as “Congested Infrastructure” and for which there is increased current and forward demand for rail freight services. There are also well-known bottlenecks and capacity pinch points (such as the Felixstowe branch) that are inhibiting freight growth and development today.
19. The FMS forecasts were based on a series of key assumptions - two notable examples being the price of oil and its impact on road haulage costs/economics & the ability of the UK Planning system to enable necessary Strategic Rail Freight Interchanges (SRFIs).
20. The output of the FMS was consistent with previous studies in suggesting future growth will be concentrated in a relatively few key economic sectors - including Intermodal (the movement of goods in containers for both industry and the retail sector), Automotive, Construction (aggregates, other building materials and spoil/waste) and International (via the Channel Tunnel).

21. The FMS forecasts reflect the changing nature of the UK economy as it continues to develop and move away from traditional “heavy” industrial sectors such as coal and steel to a more service orientated composition which relates more closely to where people live and work.
22. Historic rail freight infrastructure provision reflected the role rail freight played between the 1960s and the 1990s; this has meant that the growth in intermodal traffic has driven the need for enhancement of rail infrastructure in other geographic areas, often in parallel with growth in passenger traffic.
23. The forecasts also highlight the critical and growing role of ports in the rail logistics chain; suitable and sufficient infrastructure connectivity to/from ports is critical for rail freight to be able to support the role the UK economy plays in global economic activity.
24. Appropriate connectivity between key UK ports and the main centres of UK population and economic activity is now a key imperative for future rail freight growth and the associated current (and additional) benefits for the UK economy.

This is where Government’s role - in terms of both policy support and funding - is key.

25. Alongside this, it will be necessary for continued investment in rolling stock and SFRIs (which will need to encompass both rail connected terminals + rail connected warehousing). The private sector will be willing to continue to invest in such facilities (both Freight Operating Companies such as DB Schenker and third parties) if both the investment climate and levels of political/regulatory risk are acceptable.

Government Policy and Rail Freight Infrastructure needs

26. The 2007 Rail White Paper defined the Strategic Railfreight Network (SFN) as “a core network of trunk freight routes, capable of handling more and longer freight trains, with a selective ability to handle wagons with higher axle loads and greater loading gauge, integrated with and complementing the UK’s existing mixed traffic network”.
27. The subsequent 2007 publication “Strategic Rail Freight Network - the Longer Term Vision” - was the then Labour Government’s expression of a long term rail freight policy. This policy was subsequently explicitly continued by the Coalition Government who (together with associated EU funding) invested over £0.5bn in rail freight infrastructure enhancements in Control Period 4.

The present Government is currently reviewing and reforming its rail freight policy.

28. Since 2007, UK rail infrastructure planning has adopted the central themes of the SFN;
 - a. Longer and heavier trains – with the standard length for intermodal trains becoming 775m;

- b. Efficient operating characteristics;
 - c. 24/7 capability;
 - d. W10/W12 gauge capability (including W9 gauge if Channel Tunnel traffic is involved);
 - e. New freight capacity where required;
 - f. 25kv AC electrification of freight routes (which provides opportunities for gauge enhancement as well as electric haulage).
 - g. The development of SFRIs, supported by the National Networks and Ports National Policy Statements;
 - h. Strategic Freight Capacity to protect necessary train paths.
29. These features remain relevant and usually form the starting point of rail freight infrastructure planning. This should continue to be the case, but the themes need regular review to avoid ossification.
30. European railways are already researching the feasibility of freight train lengths of 1500m on selected European mixed-traffic routes, and it is well known that North American practice remains to operate freight trains that are significantly longer than 775m.

Connecting Northern Cities

31. Northern cities are already important destinations/origin points for intermodal and other traffics to/from ports and the Channel Tunnel, with established services to & from key ports such as Southampton, Felixstowe and London Gateway (the three ports that currently dominate UK links to many global supply chains).
- Much of the Control Period 4 and 5 rail freight expenditure / plans have been targeted at improving gauge capability and limited capacity additions on routes to/from these ports. Some of the CP5 plans – for example gauge enhancement between Syston Junction (near Leicester) and Stoke-on-Trent - are currently being re-phased following the Hendy Review.
32. Planning freight trains into some existing terminals (e.g. at Trafford Park in Manchester) is already complex because of the sheer number of other trains at locations such as Manchester Piccadilly.
33. In addition, movements of bulk products such as aggregates and building materials also feature into cities such as Manchester and Leeds, although not to the extent currently seen in London and the South East.
34. The Humber ports – and especially Immingham – are the UK's largest rail freight forwarding locations with very substantial volumes especially of bulk products such as petroleum, coal, biomass and steel.

35. The port of Liverpool, with established rail traffics such as coal, steel and biomass, is investing in a new £300m deep-water container terminal that will double the port's container handling capability and a trial rail intermodal service to the West Midlands has recently been operated.

If the port's aspirations for growth are achieved, it is likely that there will be significant increases in rail freight volumes and these are likely to impact across the north of England and pose significant challenges for the rail sector.

36. Northern cities, particularly in the NW, are central to the FMS growth plans, whether from local ports or more distant ports or regions of the UK. Crucially capacity to accommodate this potential growth is limited/constrained on *all* the key routes.
37. Cross-Pennine transits have become especially challenging. It is not possible to obtain economically viable freight paths during the day on the main Manchester – Leeds route via Huddersfield (known colloquially as the “Diggle” route) and it is increasingly difficult to obtain freight paths on the Calder Valley route via Hebden Bridge.

The main “freight” cross-Pennine route has therefore become the more southerly Hope Valley line between Stockport and Sheffield. This is better located for (e.g.) aggregates movements from the Peak District rather than for intermodal or biomass movements. However access to, and capacity on, this route is not without its own challenges.

38. Studies into options for future cross-Pennine rail options therefore need to ensure that rail freight's needs are taken fully into consideration and that current routing assumptions should not be presumed to be ideal or even acceptable.
39. The West Coast Main Line (WCML) is the UK's principal freight artery, critical for intermodal and international movements and central to the realization of the FMS growth projections. Key elements in achieving this will include;
- a. Securing for rail freight an appropriate share of the capacity on the WCML that will be released after the construction of High Speed Two;
 - b. Ensuring that the introduction of classic-compatible HS2 trains onto the WCML north of the HS2 dedicated infrastructure does not result in a timetable that “squeezes” existing rail freight services or projected rail freight growth;
 - c. Ensuring sufficient connections for rail freight exist between the WCML and existing / proposed SFRIs in the North West.
40. Increased use of rail freight into and through Northern Cities would seem to offer potential additional benefits for customers/users if sufficient capacity could be developed. There would also be wider societal/environmental benefits in terms of a reduction in carbon and other emissions and improvements in air quality.

London's Transport Infrastructure

41. London's current rail freight activity falls into two distinct categories;
 - a. Trains that support the economic activity of London and the surrounding region.
 - b. Transit freight that passes through London because of its hub position in the UK rail network.
42. Very substantial volumes of construction materials are moved into London and the surrounding region and underpin much building and development activity. Trains come from Yorkshire, the Mendip Hills, the Peak District and Leicestershire as well as closer locations on a very frequent basis, conveying aggregates, cement and other building materials.

These are delivered to a network of relatively small single-user rail terminals where the product is unloaded, stored and then distributed by road to building sites. Physical space limitations at these receiving rail terminals mean that frequent rail deliveries are necessary and the operations often have characteristics similar to "just-in-time" deliveries. Many of these terminals also have operating limits imposed as part of planning consents which in turn impedes the relationship with the rail network.

43. In the opposite direction, rail can be an effective solution for the removal of spoil or waste from larger development sites, especially if the material is contaminated or requires special handling. For many years rail has moved containerized domestic waste from London for landfill.
44. Rail freight also provides substantial support for the Automotive industry in the London area, in moving automotive components and on occasion finished vehicles.
45. A notable exception to the commodities handled by rail in London is Intermodal or containerized goods. In part this reflects the proximity of London to the main Deep Sea ports, as well as the Channel Tunnel and short sea ports such as Tilbury and Purfleet. However the lack of any substantial SFRIs or terminals in the London area means that potential domestic intermodal traffics cannot be realized.

Strenuous attempts have been made over the past decade to develop new intermodal rail handling facilities in the London and South East. In particular, potential developments at Radlett and Colnbrook have spent years attempting to navigate the Planning System and being resisted by local authorities and residents at every stage.

46. A network of SFRIs, around London (perhaps in relation to the motorway or trunk road network) are a key requirement for the nation as well as the city/region to realise the economic and other benefits of modal shift to rail.
47. London's proximity to key ports such as London Gateway, Felixstowe, Tilbury and Purfleet also explains much of the transit freight that is routed via the capital. The broadly "hub and spoke" nature of the UK rail network means that there are few

routes between the arterial “main lines” outside of London.

Until relatively recently, some cross-London railways such as the West London Line & Gospel Oak – Barking Line were predominantly freight; however growth in demand for passenger rail services has led to dramatic increases in passenger use of these and other lines such as the North London Line, and increasing pressures between passenger and freight use. These routes are moving toward a very frequent ‘turn up and go’ passenger service which reduces capacity for rail freight services dramatically.

48. In addition, all rail freight services from the Channel Tunnel (whether traveling via High Speed One or Network Rail infrastructure) are routed via London.
49. Almost without exception, there are no alternatives to the current transit freight train routing through London. Development of the route north of Ipswich to Peterborough is aimed at accommodating *some* of the projected freight growth from Felixstowe – but none of the existing traffic.
50. Looking ahead, the volumes of rail freight in and around London will continue to increase.
 - a. The role of rail in moving construction materials will continue – DB Schenker, together with the construction industry, are developing new, larger & more efficient multi-user aggregates facilities at Bow, Cricklewood and Willesden. These will be capable of handling larger trains more quickly and will help to create the capacity required to support infrastructure growth in London. They will increase the product carried per train path into the capital and will provide modal shift potential. It is not clear if the development of these sites will create land capacity elsewhere for development or whether these will be in addition to existing facilities rather as replacements.

Without this movement of construction materials, planned developments and increases in housing supply are also likely to be impeded or frustrated.

- b. Rail will continue to support major infrastructure schemes – for example in the building of High Speed Two and associated developments such as the redevelopment of Euston Station or the Old Oak Common area.

This contribution can be maximized with early engagement within the Pre-Planning / Consultation process so that rail freight can deliver enhanced economic and environmental benefits to projects as proven by in the cases of Heathrow Terminal 5, London 2012 Olympics and Crossrail.

- c. DB Schenker is also investing in a new Railhub for automotive handling adjacent to the junction between Network Rail infrastructure and High Speed One at Barking. This facility will be able to exploit the movement of finished vehicles to and from the UK via High Speed One with its larger loading gauge which will increase the rail options available for use.

This facility will benefit Automotive manufacturers in the London area, but

also others across the UK and has the potential to become a vital node in imports and exports for a key UK manufacturing sector.

- d. When one or more SFRIs are finally opened, the potential for intermodal movements between London & the South East and the North West/Scotland will be significantly enhanced. Such movements are a key part of the forecast growth of the Network Rail FMS.
 - e. In addition, there is potential for rail involvement in “City Logistics” with rail movement of consolidated deliveries for retail outlets to terminal stations or other hubs, and then transshipment to (e.g.) electric or other vehicles for sustainable “last mile” delivery.
 - f. The continued development of London Gateway will also result in increased rail services, most (if not all) of which will be routed via London.
51. Increased rail freight services also offer the potential to reduce carbon and other emissions, improving air quality and supporting improved quality of life.
52. Together with the forecast increases in demand for passenger services, it is evident that much of London’s key rail infrastructure will remain mixed traffic in nature and operating at or near capacity, with potential implications for performance.

Increasing rail capacity in London via physical enhancement is expensive and disruptive; the deployment of ERTMS/ ETCS might offer some relief, but this is uncertain and some years away.

As a minimum, improved planning and co-ordination (within what is possible in competitive markets and customer requirements) would seem advisable.

53. On its own, it is unlikely that any rail freight developments will justify the level of capital expenditure in major infrastructure enhancement – but the benefits of rail freight may well make a substantial contribution to the benefits calculation of any wider business case and it is important that these are always carefully articulated and factored in.
54. Network Rail and other railway organizational forms typically follow the arterial route structure into London and hence cross-London movements such as rail freight will cross two, three or four railway organizational boundaries. It is important that any potentially negative effects of this are avoided as Network Rail devolves more power to its routes; this will be a key task for the System Operator function of the future.

The Benefits of Transport Investment: and why we can't build our way out of congestion

Submission to the National Infrastructure Commission by Dr David Metz, Honorary Professor, Centre for Transport Studies, University College London, formerly Chief Scientist, Department for Transport.

In this submission I offer evidence of the ways in which transport investment benefits individuals and society, in particular how this contributes to economic growth. I compare and contrast the rather different situations of London and the Northern cities.

Long term trends in travel behaviour

The Department for Transport (DfT) commissioned the first National Travel Survey fifty years ago and has repeated this regularly for forty years. Figure 1 shows the key parameters on a per capita basis covering all modes of travel (except international air). Average journey frequency has remained at about 1000 trips per person per year over the period. Average travel time has held steady at around 370 hours a year or an hour a day, a figure found globally for settled populations. What has changed is the average distance travelled, which increased from 4500 miles a year in the early 1970s to 7000 miles by the mid-1990s, since when there has been no further growth.

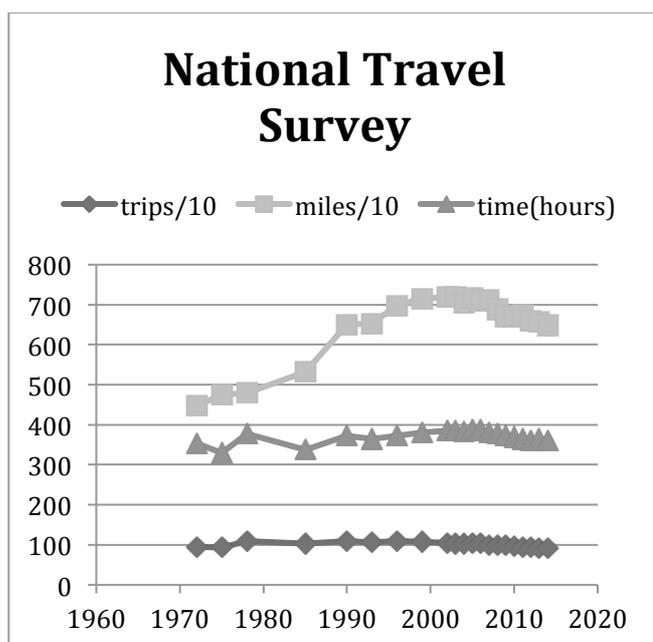

Figure 1 Source NTS(2015)

People have travelled further in the same amount of time because they have travelled faster, the consequence of investment in speedier forms of transport – private investment in cars, public investment in road and rail infrastructure and trains. It is important to recognise that people have taken advantage of higher speeds to reach more distant destinations, not to save time travelling to unchanged destinations. We travel further in order to have more access, opportunities and choices. For instance, by travelling faster on the journey to work, we have more choice of employment accessible from where we live in the time we allow ourselves for commuting, more choice of homes accessible from our workplace, and similarly more choice of shops, schools etc.

Figure 1 shows that there has been no growth in per capita travel for the past twenty years. Growing personal incomes are no longer an important factor in the growth of travel. Rather, population growth is now the main driver of overall demand growth.

Three-quarters of the average distance travelled in Britain is by car, hence we find that the average distance travelled by car has also ceased to grow, starting well before the recent recession. This cessation of growth of per capita car use is found for most of the developed economies for which data is available, a phenomenon known as ‘peak car’. A number of contributing factors have been identified, including less interest in cars by the urban young, changes in company car taxation (in the UK), saturation of demand for access to daily travel destinations, and technological constraints on faster travel (Metz, 2013).

Economic benefits of transport investment

The convention of transport economists, central to the DfT’s investment appraisal methodology, is that the main economic benefit of transport investment can be estimated as time saved through faster travel. Such time savings are valued because they permit more productive work or desired leisure. However, the evidence of the National Travel Survey is that there are no time savings in the long run, as seen in Figure 1, which is in effect an evaluation of the impact of cumulative investment over a forty year period. Time savings are therefore short run and mislead as regards the benefits of investment in long lived infrastructure.

People take advantage of higher speeds to travel farther, which results in changes in land use, development in particular. This is evident in the regeneration of East London, Docklands and beyond, the consequence of public investment in urban rail that has made brownfield land accessible for development by private sector developers who construct commercial and residential properties that accommodate jobs and homes for the city’s growing economy and population. The causal mechanism linking transport investment to economic benefit is via improved access and resulting development.

Notional time savings by those who, for instance, will travel from home to Canary Wharf using Crossrail when opened do not illuminate the case for this investment since these depend on both uncertain forecasts of passenger

numbers and problematic Stated Preference experiments intended to value individuals' trade-offs between time and money. Moreover, the 'wider impact' benefits that are conventionally added to the time savings are based on econometric estimation of agglomeration and related effects – further notional benefits, not directly observable.

Changes in land use and enhancement of land values are not included as benefits in conventional appraisal because this is seen as double counting benefits already included as time savings. However, this is a theory-based approach. An evidence-based approach would count what is real and observable, which would avoid double counting because people can do only one thing at a time – if they are taking the benefit of faster travel to gain more access, opportunities and choices, they cannot be saving time to carry out other activities, and vice-versa.

Investment appraisal of proposed transport investments should accordingly be based on evidence of expected benefits, as assessed from evaluations of outcomes of similar completed schemes. In general, changed land use and real estate development will constitute an important part of the benefits, which it would be misleading to disregard.

Road and rail investment

The case of investment to catalyse the development of Docklands is characteristic of new rail routes. Recall the USA in 1840, populated largely along the coasts and inland waterways, the economy about the size of that of Italy's. There followed a boom in railway construction that opened up the interior to agriculture, mining and industry such that by 1890 this was the largest economy on the world.

Rail investment can effect a step change in access. For roads, the effect is generally incremental. Consider England's Strategic Road Network (SRN) where much investment is planned to cope with forecast growth of traffic. Congestion largely occurs near to populated areas where local users take advantage of the network for daily travel, whereas remote from such areas the traffic generally flows freely. Thus about half the traffic on the M25 comprises long distance users, for instance between the south coast ports and the Midlands and the North, avoiding London, the purpose for which this orbital route was built. The other half is local traffic, in particular journeys to and from work giving rise to the familiar morning and evening peak congestion.

The conventional approach to investment appraisal sees a congested motorway as an opportunity for investment to increase capacity. Time savings per vehicle multiplied by the large number of vehicles, then multiplied by standard values of time savings, generate monetary values of economic benefits that are compared with the construction costs to allow judgment about value for money. However, the time savings per vehicle are quite small.

Evaluation by the Highways Agency of a large number of what it terms 'major schemes' indicates average time savings of 3 minutes at peak, less away from the

peak usage. There is debate about the significance of such small times savings. On the one hand, it is argued that these are too small to change behaviour and so should be disregarded. On the other, it is contended that small time savings add up and so in logic must be counted.

While 3 minutes saving on a long distance trip is immaterial in behavioural terms, such time saving is likely to be significant for a local user. The faster travel made possible by an extra lane or improved junction, for instance, allows more opportunities and choices, particularly when people come to change jobs or move house. More generally, in those parts of the country where demand for housing exceeds supply, it must be expected that local users will take advantage of additional capacity on the SRN to seek more distant housing opportunities that they can afford. A similar effect is seen with urban rail improvements such as London's Overground. Some of the largest percentage increases in house prices in London in recent years have been found near stations on this route south of Docklands, in locations like New Cross, of limited inherent attraction but with relatively low priced housing.

When analysing the case for road investment, it is important to consider the different kinds of user and how each may benefit (as is done for rail investment, where commuters are distinguished from long distance travellers). Available evidence is consistent with the proposition that the main benefits of investment in the SRN accrue to local users who are enabled to travel further on their daily trips. The extra traffic thereby generated is known as 'induced traffic', which is the consequence of road construction and arises because in the long run people take the benefit of faster travel by travelling further, not by saving time. This extra traffic restores congestion to what it was before the investment and is the basis for the maxim 'You can't build your way out of congestion', which we know from experience to be generally true.

The increased access made available to local users leads to changes in land use - property development where planning consent is granted, increased prices of existing property where not. Such development is largely unintended. There is, however, a case for intentional road construction to foster development, but this has to be led by the developers and planners. If they agree that a site is suitable and commercially attractive for development, whether residential or commercial, and if investment in road access is needed to permit the development, that could be an appropriate claim on a roads budget, whether local or national, subject to a value for money test.

An example is the plan for a new 'garden city' on a former military site near Bicester, where 13,000 new homes are to be built and where the DfT has allocated £44m for road construction, including a link to the M40. This illustrates both that new housing on greenfield sites will require road investment on account of car ownership by residents, and that decisions about the location of such investment must be based on the intentions of the planners and developers, bottom up, not as part of a top down national strategy.

Tackling congestion

The rationale for much roads investment is to relieve congestion. One stated aim of the Government's Road Investment Strategy is a 'free-flow core network, with mile a minute speeds increasingly typical'. But if we can't build our way out of congestion through investment in civil engineering technologies, how is this aim to be achieved?

One possibility would be to toll new road capacity, partly to finance the construction and partly to deter local users who impede long distance traffic. The M6 Toll road operates successfully in this way.

A second approach addresses the reason why congestion is a problem. Surveys of road users indicate that an important factor is lack of reliability - the uncertainty of journey time. This can be tackled by providing users with good predictive trip time information. An example is the motorway roadside variable message sign predicting the time to the next junction – albeit short range and hence of limited utility. A more ambitious service is provided for freeway users in the Seattle area of the US who can input to the Department of Transportation website the locations of their home and work, the time they wish to arrive at work, and are advised the time to leave home to be at work on time 19 times out of 20. A further example is Google Now, which includes predictive travel times on the road system.

As well as providing useful information to individuals that lessen unreliability associated with congestion, there are benefits to the network as a whole. There are two kinds of road user: those who need to be at their destination at a particular time (for instance, going to work, to a meeting, making time-critical deliveries), who can use predictive journey time information to decide when to set out; and those who are more flexible in trip timing (going shopping, making am/pm deliveries), who can use such information to avoid peak traffic. This is win-win since the more the flexible users can avoid peak times, the less the congestion experienced by those who cannot avoid them.

The scope for mitigating the uncertainty associated with congestion is indicated by the ability of efficient road freight hauliers to offer clients just-in-time delivery. A haulier may contract with a supermarket chain to deliver from the central warehouse to the stores within 30-minute time slots, which the haulier can achieve because of the good understanding of the network and the ability to manage the location and performance each vehicle in the fleet using real-time and predictive traffic data from commercial sources.

Transport and economic performance

This road freight example is one instance of the way in which investment, in digital technology in this case, can contribute to improving business performance. It should be seen in the broader context of retail distribution taking advantage of faster travel on the road network to optimise efficiency by

consolidating many regional depots into a few large central facilities, thereby saving estate and inventory costs while improving distribution to high street outlets, so enhancing competitiveness.

It is, however, difficult to generalise about how transport investment may be expected to improve economic performance where the road and rail networks are mature, so that investment is at the margin, rather than transformative. The What Works Centre for Local Economic Growth at the London School of Economics has reviewed 29 impact evaluations that met minimum standards of evidence (WWC, 2015). Key findings, mostly based on a small number of studies, include:

- Road projects can positively impact local employment. But effects are not always positive and a majority of evaluations show no (or mixed) effects on employment
- Road projects may increase firm entry (either through new firms starting up, or existing firms relocating). However, this does not necessarily increase the overall number of businesses (since new arrivals may displace existing firms).
- Both road and rail projects tend to have a positive effect on property prices, although effects depend on distance to the project (and the effects can also vary over time)

The general lessons from this review of transport investments are:

- The economic benefits of transport infrastructure spending – particularly as a mechanism for generating local economic growth – are not as clear-cut as they might seem on face value.
- Arguments for spending more in areas that are less economically successful hinge on the hope that new transport is a cost-effective way to stimulate new economic activity. We do not yet have clear and definitive evidence to support that claim.
- Our findings raise fundamental questions about scheme appraisal and prioritisation, and about the role of impact evaluation in improving decision-making around transport investment.

Transport investment in London

The population of London is growing quite rapidly, but the city long ago decided not to accommodate additional car use, so the share of journeys by car has fallen from a peak of 50% of all trips in 1990 to 37% currently, with further decline to about 27% expected by 2050 on the basis of forecast population growth (central case) and continuing policies to invest in rail but not increase road capacity. Figure 2 shows an estimate of the share of journeys by car in London over the century 1950-2050. This exemplifies the concept 'Peak Car in the Big City'.

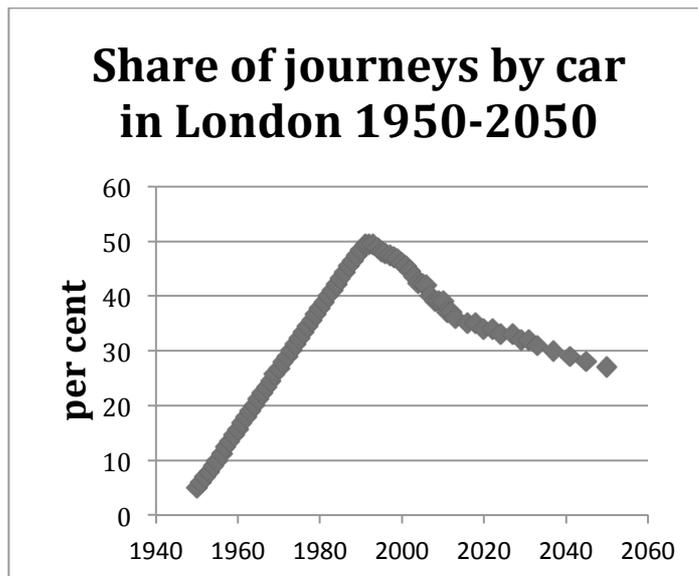

Figure 2 Source Metz (2015)

London is thriving - economically, culturally and socially – both despite and because of the decline in car use. Two key policies are largely responsible: a road capacity constraint plus parking controls in the inner boroughs and congestion charging in the centre; and major investment in rail that provides speedy and reliable travel for work trips, compared with the car on congested roads. As we see at Canary Wharf, well paid professionals can be attracted out of their cars onto trains through the stick of limited parking and the carrot of frequent fast rail services. In contrast, cities that rely on buses for public transport find it much more difficult to get commuters out of their cars.

The Mayor of London is responsible for both the transport system and for spatial planning, a helpful combination which contributes to the success of the city. The London Infrastructure Plan 2050 outlined options for investment in transport and other infrastructure to respond to population growth from 8.6m currently to 11.3m central estimate by mid-century and the corresponding growth in employment. This spatial plan provides a suitable strategic context for specific schemes such as Crossrail 2.

The economic case for each individual scheme will need to be made. This case needs to be grounded on evidence-based expectations of the benefits, in particular development of real estate (land and property) that will accommodate jobs and homes. Benefits from travel time savings should be counted only when these can be observed. Notional benefits from ‘wider impacts’ would be subsumed within market values of property and rents.

Given that the long term benefits from transport investment are found as real estate development, Transport for London should work closely with developers and planners to secure the benefits from its investment. In favourable cases, the enhancement of land values may be sufficient allow the developers to contribute to the cost of the transport investment.

Transport investment in Northern cities

The example of London argues for a spatial plan to provide the context and rationale for transport investment in the Northern cities to accommodate population and economic growth. One possible outcome, perhaps tacitly, would recognise Manchester as the main centre of the region, with an emphasis on the development of that city as a centre for business services. Another, perhaps politically more feasible, would be a multi-centric region of medium sized cities, somewhat analogous to the Thames Valley, with a mix of manufacturing and services. One key question is how to take advantage of the research potential of the universities, both for the cities in which they are located, and across the region. Related to this is the question of where to locate business in relation to the availability of skilled staff (it is noteworthy that Amazon has recently moved its UK HQ from Slough to central London).

At present there is no mechanism for spatial planning across the Northern cities as a group, and hence no consideration of options for location of population and economic growth across the region. Absent a spatial plan, decisions on transport investments will be an important influence on spatial development in ways that need to be addressed as part of the investment case.

It is not straightforward to develop a persuasive case for specific investments in the context of the Northern cities. Estimates of benefits based on travel time savings give no indication of the spatial location or likely scale of development. Estimates of 'wider impacts' depend on either rules of thumb or ambitious modelling which cannot be validated. It is therefore hard to say how transport investments will benefit the economies of these cities, based on conventional appraisal methods.

It is easier to predict changes in land use arising from transport investments that change travel to work patterns. Faster travel may be expected to result in people seeking housing and employment opportunities further afield. This would both improve the efficiency of labour markets and create opportunities for housing developments. For rail investments in particular, the location of new housing should be planned as part of the investment case.

Urban rail investments can allow cities to grow to higher density while meeting the mobility needs of the population. Regional rail plays a similar role. The tram-train being piloted at Sheffield-Rotherham is a relevant innovation. Bus rapid transit likewise provides speedy, reliable travel but at a cost lower than light rail (trams). Higher urban population densities generate agglomeration benefits, not only economic but also cultural and social, which enhance the attractiveness of cities, provided other aspects of urban liveability receive adequate attention. Accordingly, both urban and regional rail investments justify positive consideration.

What is unclear, however, is the extent to which better regional rail links that improve connectivity *between* cities would generate economic benefits over and above those associated with housing and labour markets for individual cities.

Road investments are even more problematic. For instance, the scheme to enlarge the M62 to four lanes along its entire length is intended to support the Northern economy but would induce local commuter use that would limit the benefits to long distance users. A new road link, largely in a tunnel, between Manchester and Sheffield might be of less benefit to commuters but would be expensive and hard to justify for improved connections between two cities that are otherwise well connected. More generally, road investments intended to improve connectivity within the region, whether north-south or east-west, are likely to be nullified by the stimulation of local use. Altogether, the ambitious plans for road construction set out in the Northern Transport Strategy seem of very uncertain benefit, albeit more consistent with a multi-centric region in which manufacturing remains important.

On the other hand, the plans for integrated information and ticketing across all public transport modes, part of this Strategy, are clearly sensible and, as digital applications, may be expected to be far more cost-effective than investment in civil engineering technologies. More generally, opportunities should be sought for other digital technology investments to improve the operations of the transport system and to enhance the experience of users. Predictive journey time information on the road network is one important possibility.

Modelling and forecasting

The standard approach to justifying transport investment of any scale involves modelling that compares a 'do something' case (ie with the investment) with a 'do minimum' case (without the investment). Most models estimate travel behaviour changes in the absence of land use change, generating travel time savings resulting from the investment that are used as inputs to the economic appraisal. However, for reasons previously discussed, assuming no changed land use is not consistent with evidence from completed schemes. Models that integrate transport and land use are available, although not generally employed.

Modelling involves much uncertainty, many simplifying assumptions and limited data for calibration. Transport models cannot be independently validated. Given the considerable judgement involved in generating plausible outputs, it is not surprising that modelling is generally found to support the inclinations of the authorities that commission the studies. When such authorities are bidding for central government funds, other people's money, modelling will generally be found to support the bid.

A further difficulty with transport models is the routine assumption that the future will be like the past, with change driven only by exogenous parameters such as GDP growth, population growth, oil prices etc. But if the future is different from the past, as is indicated by the peak of car use in London (shown in Figure 2) and similar indications for Birmingham and Manchester (Metz, 2013), then forward looking relationships (elasticities) need to replace historic calibration data. This is difficult to achieve in practice. For example, the DfT's

National Transport Model has not yet recognised the emergence of peak car use in London and so forecasts substantial increases in car traffic in this city.

Conclusions

The transport system moves people and goods through space. New investment adds to this movement, the benefits being reflected substantially in changed spatial distribution, not reductions in travel time. The difficulties that the Commission is likely to experience in making recommendations for transport investment derive in part from shortcomings in existing methodologies, in particular that conventional economic appraisal is based on estimates of notional times savings and disregards the evidence for changed land use and real estate development as important benefits of investment. Moreover, conventional travel demand modelling and forecasting does not recognise important recent changes in behaviour, as reflected in the peak car phenomenon.

For its medium term work, the Commission might wish to review these methodological issues. More generally, there may be a role for the Commission to act in ways analogous to the Office for Budget Responsibility and the Committee on Climate Change, offering advice to national and local government on the merits of infrastructure investment based on independent analysis, both of methodologies and of substance.

In London, expected economic and population growth is the main determinant of future transport investment, which is therefore relatively unproblematic in principle. For the Northern cities, such growth is less obviously a given, and a desired role for transport investment is to foster growth. However, the prospects for speculative transport investments are uncertain. Hence to secure the benefits of transport investments, decisions should not be taken in isolation but as part of planned real estate developments involving both developers and planning authorities. Decisions on urban and regional rail investments seem more straightforward than for road investments, for which there is a good case for preferring cost-effective digital to costly civil engineering technologies.

RE: NATIONAL INFRASTRUCTURE COMMISSION CALL FOR EVIDENCE

I am writing on behalf of the Ebbsfleet Development Corporation (EDC) in response to the call for evidence on National Infrastructure needs.

Ebbsfleet Development Corporation

The EDC has been established by Central Government to deliver Ebbsfleet Garden City: a development of up to 15,000 new homes in North Kent, with new employment opportunities and supported by transport, utility and community infrastructure. Blue and Green infrastructure will also be an important and defining characteristic. The recent announcement of Enterprise Zone status and securing £310 million of funding to support infrastructure will result in a high level of activity in developing the garden city and since is now over 1.2 million square metres of commercial, retail and leisure uses consented across the Garden City resulting in both residential and commercial growth.

Ebbsfleet Garden City is to be delivered at pace aspiring to provide a high quality built environment. It is anticipated that the impact of the Garden City will be felt beyond the EDC's boundary, with a positive ripple effect locally (particularly in Dartford and Gravesham boroughs), both in the residential and commercial markets. Whilst it is not possible to quantify this as this time, anecdotally a positive uptake in the housing development and developer interest is being reported locally following the Garden City announcement.

Existing Strategic Context and Connectivity

From a transport perspective, Ebbsfleet Garden City is very well located; existing rail connections provide both high speed (HS1) and conventional rail services into London from three local stations: Ebbsfleet International, Northfleet and Swanscombe. Central London is therefore within 17 minutes of Ebbsfleet Garden City, with excellent connectivity into the wider Kent region too. The presence of direct Eurostar services additionally means quick and easy access to continental Europe.

Rail infrastructure is therefore one of the key attributes and requirements of Ebbsfleet Garden City as future destination for living, working and leisure. In response to the questions asked by the NIC the following key infrastructure improvements are hugely relevant:

Upgrading the A2

Upgrading the A2 is identified as one of the top 40 infrastructure items in the NIC under the strategic road network capacity heading. The delivery of the Garden City is heavily dependent on there being sufficient capacity in the local and trunk road network. Whilst the primary infrastructure of HS1 will take some of the strain for the commuting population, the homes under development at Castle Hill, the National Grid site, at Northfleet and at Ebbsfleet and the rest of Eastern Quarry, along with the advent of the London Paramount resort in 2021, will mean that an improved A2 needs to be functioning at optimum levels. The two crucial junctions are Bean junction and Ebbsfleet junction which unusually for a dual carriageway are within 1 mile of one another on the A2 to the south of the Garden City and the sites referred to above.

Ebbsfleet International Station

Following initial studies by HS1, there will be a need to upgrade the station building at Ebbsfleet International should the major international resort London Paramount come to fruition, to ensure that it has sufficient capacity to cope with future customer projections. This will include changes to facilitate pedestrian flow, way finding and both core and non-core facilities to ensure an excellent service and environment for all types of customers, noting particular that the London Paramount resort proposals will mean a more two way flow, as opposed to the current, near tidal operation.

Rolling Stock

Following initial studies, it is apparent that new rolling stock and train services will be required to cope with the large increase in future customer demand, particularly at peak commute times and during new weekend peaks created by the London Paramount Resort. The quality of service delivered along the track and at stations, both during and after construction, must be protected to prevent disruption to train operations and the travelling public.

Lead in times for procurement of rolling stock are lengthy and need to be planned accordingly to avoid the negative public perception of the railway and corresponding detrimental impact on the new developments and the Garden City.

Crossrail

A safeguarded Crossrail route already extends beyond Ebbsfleet from Abbey Wood to Hoo Junction. When seeking to deliver a garden city in the 21st Century this route is seen as an obvious opportunity that the EDC should pursue. The EDC feel that extending Crossrail from its current terminus at Abbey Wood to the stations at Swanscombe or Northfleet or Gravesend along the existing protected route would be extremely beneficial to growth in the vicinity. An extension into Ebbsfleet International Station would connect much of the rest of Kent into this service, particularly to Heathrow.

This infrastructure is imperative to attract development and investment in the Ebbsfleet area and as such the EDC has joined with Bexley Council, Kent and TfL in preparing a joint submission sent under separate cover. Provision of this Crossrail extension provides a further direct route from London, improving the Ebbsfleet location for commuters and hereby increasing housebuilder confidence in the location. It further increases commercial and employment potential in the area and continues to assist in opening up North Kent/ East London as future centres for development. North Kent’s development plans and population growth form an attractive proposition for new companies from the UK and overseas to relocate or expand here. For this to happen road and rail infrastructure must be improved and capacity increased.

Yours sincerely,
Louise Wyman
Director of Strategy

England's Economic Heartland
Programme Office
c/o Buckinghamshire County Council
County Hall
Walton Street
Aylesbury
HP20 1UA

8th January 2016

Dear Sir,

National Infrastructure Commission: call for evidence
Response of England's Economic Heartland Strategic Alliance

The Strategic Alliance is a non-statutory partnership whose participants share a collective ambition to realise the potential of England's Economic Heartland. Its participants are committed to looking beyond current success and, through collaborative working to a common purpose, raise levels of productivity to match, and where possible exceed, those of global competitors by addressing the identified barriers to economic growth.

As an Alliance of strategic authorities and their constituent LEPs, the partnership represents almost 3.5 million people from:

- Oxfordshire
- Buckinghamshire
- Northamptonshire
- Milton Keynes
- Luton
- Central Bedfordshire
- Bedford
- Cambridgeshire

It is an expressed aim of the Alliance to seek to become a statutory Sub-National Transport Body. The Alliance partners are also committed to developing a strategic infrastructure plan whose scope reflects that of the Commission: a recognition by the partners of the critical importance that strategic infrastructure has to play in supporting planned growth.

Given these ambitions, the proximity of the Heartland to London, the Midlands and North and our shared issues with connectivity, London transport infrastructure and energy supply, the Alliance looks forward to working closely with the Commission as it looks to advise Government on future infrastructure investment priorities.

Connecting Northern Cities

1. ***To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?***

2. ***What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.***
3. ***Which city-to-city corridor(s) should be the priority for early phases of investment?***
4. ***What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?***
5. ***What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?***

The Alliance makes no response to these questions but raises the matter that the success of economic initiatives in the North are in no small part dependent upon the infrastructure connections through and across the Alliance area, particularly through improved radial and orbital movements from London and the South Coast by road and rail.

London's transport infrastructure

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London and its commuter hinterland face significant economic and social challenges in the short, medium and longer term. Unless drastic changes are made over the next two to three decades, congestion will have a severe impact on the economy and people's daily lives, with many journeys being effectively impossible. Forecasts show that additional transport capacity is required across the wider South East but this should not necessarily be through continued emphasis on focusing exclusively on radial connectivity. New or improved strategic road and rail infrastructure across the wider South East will change travel patterns thereby supporting economic development in the wider South East and at the same time provide some relief to the demand on traditional radial corridors serving London. In addition to giving rise to wider beneficial impacts for London and England's Economic Heartland, such an approach would be consistent with the Government's ambition to rebalance the economy.

It is clear from our engagement in the emerging London Plan, that the economy will continue to be over-heated in the city and there will be difficulties in meeting the housing demand that comes with this. It has also been accepted that the South-East supports London growth by delivering homes to meet the current and planned growth through our own housing allocations. A sub-national approach to strategic planning will be needed to avoid offsetting this economic growth by extending radial links outward to bring labour to jobs; rather there needs to be a shared aim to re-balance the economy across the South East (and indeed to the north as well) and seek to reduce the need for journeys through/to London by providing much needed infrastructure to support economic growth in the wider South East. This will allow London to meet more of its own need whilst supporting a more balanced economic approach.

Some of the fastest-growing towns and cities in England are located in a belt to the north of London which already enjoy some strong, albeit well-used, links which support London. England's Economic

Heartland – with an economy worth £90bn but with the potential to grow another 20 per cent - clearly has the potential to help offset some of the over-heated economic impacts on London so that existing radial networks can more efficiently serve in and out-commuting to meet demand. The economic potential of the Heartland area reflects its competitiveness in global markets, driven by its leadership in the digital economy. Our approach to investment in transport infrastructure must avoid reinforcing traditional patterns of movement when economic growth derives from the new economy.

England's Economic Heartland sits on the busy road and rail transport corridor between the south coast ports, the Midlands and the north and enjoys easy links to London and the West Midlands via the M40. However, it suffers a lack of east-west connectivity, in particular to the high-value growth areas around Milton Keynes and Cambridge, and also in terms of access to/from the international gateway at Luton Airport (including business aviation needs arising from businesses in the Heartland area operating in the global market).

There are currently no direct rail connections between the centres of Oxford and Cambridge and to the areas in between (forcing commuters to travel into London in order to come out again), while travel by road involves cross-country single-carriageway routes or use of the M25 around London. Improving the connectivity on this corridor – through East-West Rail and the Oxford to Cambridge Expressway projects - will place the authorities in the Alliance at the centre of the south-east orbital corridor as a key hub for south-west to north-east transport. As a result, England's Economic Heartland would realise further improvement in agglomeration opportunities for jobs, growth and innovation, with its vastly-improved road and rail links to these high-value centres of the UK economy.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

The focus for investment to help London should not solely be within London. Existing radial routes, much the focus of current and previous national investment, serve to provide vital lifelines for labour supply to meet London's booming economy. While the Heartland area has good radial connections into and out of London, the service level on transport connections across much of the area - for example, including between major economic hubs such as Oxford, Cambridge, Aylesbury, Milton Keynes and Luton – is notably poor, a consequence of existing high levels of economic activity and travel demand already looking to avoid the need to transit the London area.

The lack of transport for people and freight between these areas creates an artificial barrier between hubs of knowledge-based growth. This area was recently recognised as being the most innovative part of the UK - connectivity between this area, and particularly north London, will not only reinforce London's and the UK's attractiveness in terms of investment, but as the area also links very well to the North West and North East, it provides a good platform for linked innovation growth in the Midlands and Northern Powerhouses.

Pushing forward with plans to complete East-West Rail and the Oxford to Cambridge Expressway (including vital links to the A34 linkage to the South Coast ports) provides a critical and long overdue outer-orbital that complements growth in London by reducing the need for traffic to transit through

it, supports the Alliance partners to realise the potential of England's Economic Heartland, as well as enabling the logistical needs of the national economy to be supported.

- ***How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?***

East-West Rail will reconnect Oxford to Milton Keynes and Cambridge by rail, and direct rail access from the west into Heathrow. This is due for completion in Control Period 6, post 2019 and must not slip any further in delivery.

In addition, work on the Oxford to Cambridge expressway is underway and we are working with Highways England to develop a route based strategy linking Southampton and the East Midlands, which will include improvements to the A34 and the development of an expressway to connect the two growth centres, linking up major economic hubs along the way (i.e. Milton Keynes, Aylesbury, Luton). England's Economic Heartland will put forward an initial statement of investment priorities in autumn 2016 as part of the input into the review of the Road Investment Strategy (due to be reviewed in 2017) and the related review of the rail infrastructure review.

- ***What might their potential impact be on employment, productivity and housing supply in London and the southeast?***

Work to date has demonstrated that improvements in economic productivity across the Heartland area would generate an additional 20% GVA per annum – equivalent to c£10bn per annum. Just as important, a failure to invest in the Heartland will result in the level of service on existing infrastructure declining making existing business activity increasingly uncompetitive in global markets. A decline in economic performance would reduce the Heartland's net contribution to the Exchequer, thereby reducing the scope for investment by Government across the UK.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

No comment.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- ***What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?***

If there was to be evidence of a proper regional distribution of investment and growth in support of London, then regional contributions to the solutions would be defensible and fair. The uplift in growth realized through delivery of both East-West Rail and Oxford to Cambridge Expressway will be significant and would need to be reflected in some way. The Alliance members already have a well-established partnership in support of East-West Rail contributing over £45m to its delivery. Furthermore, the likelihood of such an arrangement would be improved should the Alliance be

successful in its attempts to become a Sub-national Transport Body as provided for in emerging legislation.

- ***What innovative funding mechanisms could be considered to support delivery of key schemes?***

Notwithstanding the potential to deploy innovative financing mechanisms to deliver key schemes, the cost of those schemes will ultimately have to be met from one of three funding sources – the user or beneficiary of the infrastructure, local sources of funding (council tax payers or local businesses), or central Government investment.

5. *How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?*

No comment.

Electricity Interconnection and Storage

The responses in this section are based on our experience of the grid or distribution network in Oxfordshire, however they are reflective of the challenges faced across the Heartland area. The Alliance partners commitment to develop a strategic infrastructure plan reflect a recognition on their part that the issues need to be addressed at a sub-national scale

The questions below assume that the installation of renewable energy generation is proceeding unhindered so as to provoke the need for balancing of supply and demand, including deploying energy storage. Unfortunately, this is not the case.

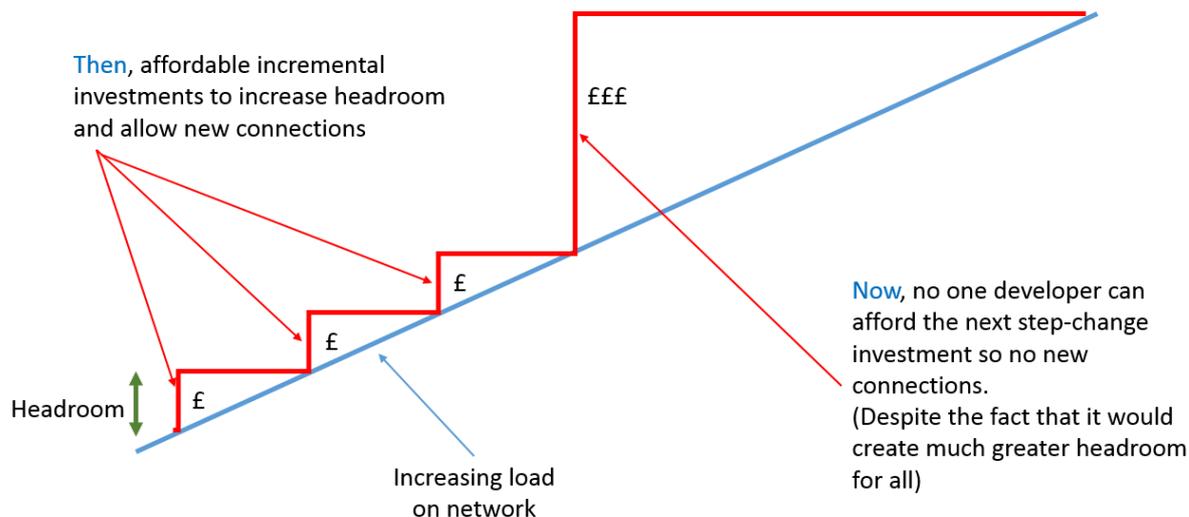

It is worth pointing out that there are two fundamental issues:

- There is an acute need to invest in renewable energy to diversify and add to current supply to meet demand; and,
- There is a need for additional capacity full stop to support large scale economic/housing growth.

The local market for connecting new renewable energy schemes to the distribution network has effectively failed. All of the sub-stations operated by Scottish and Southern Energy Power Distribution (SSEPD) across Oxfordshire for example, are constrained by fault levels. So, in practical terms, there will be no new large installations (above 50kW) in Oxford for the foreseeable future. In Bicester, there will be no new renewables, nor allocation of new supply connections until 2019 at the earliest. There are similar examples from elsewhere in the county: In November, a £240k solar PV scheme in Chipping Norton, Oxfordshire, was recently quoted a connection cost of £437k with a delay of two years, making the scheme unviable.

As elsewhere across the Heartland area, Oxfordshire's local grid needs significant investment to make it fit for the 21st century. It needs to move from a centralised energy system designed to distribute electricity in one direction to the smart system needed to manage embedded generation and storage, as well as the increasing up-take of electric vehicles. At present, this is funded by individual developers as they request a connection. We have reached the point where no one individual developer can afford the cost as shown in Figure 1 – The Investment Hurdle

Figure 1 – The investment hurdle

We also believe there is a significant information failure in this market: scheme developers are unaware of each other, making it difficult to pool resources. The Distribution Network Operator (DNO) reacts only to firm requests to connect rather than taking a strategic view based on the much wider range of information available. The Alliance suggest that the regulatory framework within which the 5-year investment plans are prepared by the operators (and approved by the Regulator) must be required to take into account the strategic growth identified by local partners. We feel the most efficient and effective way of doing this would be at a sub-national level reflecting the reality that networks extend beyond individual local authority boundaries.

The current approach is inefficient thereby increasing costs to developers – in re-scaffolding when limits on schemes size are relaxed or in abortive costs when schemes turn out to be financially unviable because of the high cost of connection.

To develop as it should, the energy grid needs mechanisms to facilitate funding in advance of a connection request, based on a strategic vision of the development of the grid. There may also be a 'public good' argument for investment in the grid, analogous to investment in other infrastructure such as roads and broadband.

The strategic vision needs to be owned by local stakeholders as much as the DNO. This requires much greater dialogue between planners, the DNOs and major users to avoid pinch-points blocking development, as is happening in Bicester with knock-on impacts on Oxfordshire's economic growth.

The Alliance suggests that an obligation should be placed on the DNO to work with sub-national bodies to identify the longer term strategic needs for additional installed capacity – and then a requirement on the regulator to take that into account when agreeing to specific 5-year investment plans. The Alliance partners are keen to work with the Commission to develop its thinking in this area with a view to shaping the remit of the Commission moving forward (and ensuring future legislation is fit for purpose).

We would also like to see greater use of the Ofgem innovation funds to help support the area's long term innovation and growth strategies. Exploring smart solutions to fault-level constraints is key as is

supporting the innovative work we are doing in the electric car market which impacts on the grid and could provide a balancing function. In this example, the electric car is part of the storage chain and adds a wider value to the energy use/storage cycle without the need for wider storage investment. This presents a huge opportunity, so reinforcing the point that forward planning must improve.

1. *What changes may need to be made to the electricity market to ensure that supply and demand are balanced, whilst minimising cost to consumers, over the long-term?*

Investors need a secure and equitable investment environment with clear long-term signals within which to plan multi-year projects that have investment and construction timescales that extend well beyond the timeframes associated with regulatory reviews. The recent reviews on rail infrastructure investment have noted the difference in terms of cost and efficiency of large scale investment schemes handled outside the 5-year regulatory framework (i.e. Crossrail and Thameslink) with those handled as part of the regulatory framework (i.e. GWML electrification) – if Government is sympathetic to shifting more strategic schemes outside of regulatory frameworks then one could see a similar approach being applied to other sectors. The Alliance wants to work with the Commission to explore this opportunity further. Without this environment, new energy supply projects will not come forward at the rate needed

At the local grid level, for example, Oxfordshire's thriving community sector is already demonstrating balancing projects which have significant potential:

- Project **ERIC** (Energy Resources for Integrated Communities) is an initiative bringing solar PV power and smart energy storage to up to 100 homes in Rose Hill, East Oxford. Project ERIC is led by Moixa Technology and Bioregional and is part-funded by Innovate UK. Using domestic Maslow batteries and a new software platform, Project ERIC aims to demonstrate how distributed storage in a community can be managed to reduce average peak grid load by 65% and increase self-consumption of local PV energy across the community by twofold¹.
- The award winning **Energy Local** project aims to use smart technology systems to pool community demand so that members can access the time of day tariff and locally generated renewable power directly, adjusting demand to reflect local generation².

The market needs to facilitate local initiatives such as these by minimising the cost and resources needed to participate. Whilst they will initially contribute to local balancing, they can of course contribute to the national balancing market at scale, which is the long term intention.

What role can changes to the market framework play to incentivise this outcome:

- ***Is there a need for an independent system operator (SO)? How could the incentives faced by the SO be set to minimise long-run balancing costs?***

There is a major need to upgrade the local grid in Oxfordshire so that it facilitates new approaches to the generation, storage and use of electricity rather than blocking them as at present. Such an upgrade will also require a change in the role of the District Network operator (DNO) to an

¹ <https://localisedenergyeric.wordpress.com/>

² <http://www.energylocal.co.uk/>

independent system operator, if not a new operator. The incentive scheme should encourage the strategic rather than reactive management of the network in partnership with local stakeholders. It could also remove the barriers in the current system which mitigate against long term strategic investment.

- ***Is there a need to further reform the “balancing market” and which market participants are responsible for imbalances?***

As above

- ***To what extent can demand-side management measures and embedded generation be used to increase the flexibility of the electricity system?***

Oxfordshire has shown that community energy initiatives, such as ERIC and Energy Local, can make a significant contribution to both demand-side management and embedded generation. In particular, the Low Carbon Hub has demonstrated that there is a strong demand for local investment opportunities. It must be recognized though that this is only part of the supply offer to meet what will be significant growth in the Alliance area.

At present, this is held back by fault level constraints and by the failure to develop a smart grid in the county.

2. What are the barriers to the deployment of energy storage capacity?

- ***Are there specific market failures/barriers that prevent investment in energy storage that are not faced by other ‘balancing’ technologies? How might these be overcome?***

Battery-based storage is still expensive. Further government investment in battery innovation, testing and de-regulation are required for example to meet the challenge of creating a step change and shift away from carbon-based engines. The Alliance area is at the forefront of this and needs continued investment to succeed.

Some energy storage devices, such as batteries, can contribute to fault levels. At present, fault level constraints in Oxfordshire and the consequent market failure limit the roll-out of such devices at scale. This basic issue needs addressing as described above.

- ***What is the most appropriate scale for future energy storage technologies in the UK? (i.e. transmission network scale, the distributed network or the domestic scale.)***

All scales are appropriate to make the best fit with the technology and source of funding eg pumped storage will work at the transmission network scale. In contrast, businesses, schools and households will invest in small-scale battery storage which in aggregate will make a significant contribution.

3. What level of electricity interconnection is likely to be in the best interests of consumers?

- ***Is there a case for building interconnection out to a greater capacity or more rapidly than the current ‘cap and floor’ regime would allow beyond 2020? If so, why do you think the current arrangements are not sufficient to incentivise this investment?***

- ***Are there specific market failures/barriers that prevent investment in electricity interconnection that are not faced by other 'balancing' technologies? How might these be overcome?***

We assume these questions relate to interconnection at the level of the transmission network and therefore have no comment.

4. What can the UK learn from international best practice in terms of dealing with changes in energy technology when planning to balance supply and demand?

How best to roll out and use a smart grid to make more efficient use of the grid asset.

The Alliance partners look forward to working closely with the Commission as it discharges its functions. If you need any further information in response to this submission please contact me on [\[email redacted\]](#)

Yours sincerely

Martin Tugwell
Programme Director

National Infrastructure Commission
1 Horse Guards Road
London
SW1A 2HQ

Dear Sir/Madam,

Response to the National Infrastructure Commission Call for Evidence - future investment in the London's transport infrastructure

Enterprise M3 is responding to the National Infrastructure Commission Call for Evidence and in particular the request relation to future investment in the London's transport infrastructure.

Enterprise M3 is the Local Enterprise Partnership for an area which covers parts of the counties of Hampshire and Surrey, including north and central Hampshire, and western Surrey up to the M25. The LEP area includes major centres such as Aldershot, Winchester, Basingstoke, Woking and Guildford. In total, the LEP area encompasses over 1,600,000 residents and 86,500 businesses; accounting for nearly 20% of the South East's economic prosperity.

The LEPs remit is to support and sustain economic growth at a local level and Enterprise M3 has set out its vision, key priorities and actions in its Strategic Economic Plan, which was published in March 2014. The SEP sets out a clear vision of what the LEP and its partners plan to do over the period up to 2020/21 to create new jobs, increase the number of business start-ups and improve the productivity of local businesses. Improvements to transport infrastructure to enhance connectivity are a key part of this Plan, which identifies a series of infrastructure improvements that are part of the 'strategic ask' for transport investment, to improve connectivity within our area, to ensure that the LEP can thrive economically, maximise job creation and attract inward investment from businesses.

The work of the Enterprise M3 LEP is endorsed by government as part of its strategy for developing the UK economy and is driven by close collaborative working with local authorities, the business community and other stakeholders in the area. The Enterprise M3 Growth Deal encapsulates the priorities that have recently been agreed with government in response to the needs and priorities that we have identified with our local, public and private sector partners.

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Enterprise M3 is particularly concerned by the potentially dismissive reference in the question to the South East as London's "commuter hinterland." If the Commission is going to achieve its aims it is essential that it recognises that the importance of the economy of the areas around London in its own right and not merely as an area that serves the needs on London. Economic success in the wider South East benefits London and indeed the whole of the UK. It is worth highlighting that the South East pays considerably more in taxes than it receives in public spending – creating a net 'profit' for the Treasury. Indeed the South East was the biggest net contributor over the 10-year period 2002-12, generating a profit of £80bn for the Treasury; this compares to London's £74.8bn over the same period.

Notwithstanding this, key social and economic challenges the LEP would highlight are:

- Meeting the Government's productivity aspirations and encouraging a higher-skilled workforce for contribute to the local economy.
- Provision of new homes and business space in appropriate locations.
- Delivery of a very large expansion in the supply of housing.
- Enhancing economic interactions and labour mobility through connectivity improvements.
- Being able to deliver transport infrastructure and capacity so that it does not act as a constraint on economic growth as well as meeting the skills and housing challenges identified above.
- Achieving certainty over expansion associated with increased airport capacity in the South East and ensuring that associated infrastructure is provided.
- Improvements to cross country road and rail routes linking South East economic areas without the need to travel via Central London reducing associated congestion.
- Better road and rail access to nationally important ports and airports to boost their attractiveness as business locations and improve connectivity to international markets.
- Reducing congestion and removing bottlenecks on strategic road corridors.
- Improved journey times on the major rail lines into London for business travellers and commuters.
- Enhancements to the attractiveness of the area for new investment, including foreign direct investment.

Improving strategic transport routes in the South East will support economic growth both nationally and locally bringing a significant return on investment for public funds. By failing to invest there is a risk of adding to the congestion, frustration and costs that businesses across the UK face when using the South East strategic transport corridors including as gateway routes to London and the South East's international ports and airports. Investment is needed to maintain the attractiveness of the area for business and to secure the delivery of key development sites, new homes, new commercial floor space and new jobs. Without strategic investment in high quality transport infrastructure London and the South East runs the risk of losing businesses to international competitors.

It is no accident that the world's leading companies see London and its surrounding areas, including the Enterprise M3 area, as the place to locate and do business. The halo effect of London supports jobs in the wider South East and the whole UK. Enterprise M3 would also advocate stronger collaborations between London and the LEP areas that surround London.

What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Enterprise M3, Coast to Capital, Solent and Thames Valley Berkshire Local Enterprise Partnerships, working closely with the local highway authorities, have jointly commissioned an economic impact study that addresses exactly this question for our area.

The work will identify, describe and quantify the economic case for improving connectivity in major strategic movement corridors across South East England.

The work is developing an economic methodology to identify and define the movement corridors. The development of the corridors will address known and forecast problems such as improved connectivity through faster and more reliable journey times. They will be prioritising the corridors, identifying potential solutions for delivering change and providing an outline business case for potential infrastructure investments. This study is due to report early later this month and the LEPs will be happy to share the results of this work with the Commission.

What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Enterprise M3 is also responding to the consultation on Crossrail 2, so attached is a copy of our response, which addresses this issue in relation to the benefits of the proposed Crossrail 2 scheme and the need for investment in other rail infrastructure on the South-West Mainline.

What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Investment in infrastructure is fundamental to achieving economic growth. Key to success in funding its provision is de-risking investment and development and creating more certainty about funding for infrastructure provision. This will ensure that the infrastructure of the area is able to support, enhance and facilitate economic growth, boost productivity and improve the standard of living.

There are many different funding models available but Enterprise M3 believes that the type of approach used to fund schemes is not as important as having certainty that funding will be available over a sustained period of time. This will ensure that infrastructure schemes can be developed, with certainty that the funding is in place for their delivery. Such certainty engenders confidence and will allow scheme promoters to commit resources to scheme development and enable businesses to plan for the future, assured that the infrastructure needed for economic growth will be forthcoming.

This is of particular important to secure housing growth and in this instance it may be that Government needs to effectively underwrite public/private funding sources, to provide a level of certainty for the accelerated delivery of housing by the private sector that is being sought.

How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

No comment

Yours faithfully,

A handwritten signature in black ink that reads "Kevin Travers". The signature is written in a cursive style with a long, sweeping underline.

Kevin Travers
Project Manager Transport Enterprise M3 LEP

London's Transport Infrastructure

Essex County Council Submission to the National Infrastructure Commission Call for Evidence
11 May 2016

1. **Essex County Council (ECC) welcomes the opportunity to contribute to the national debate on transport infrastructure via the inquiry being undertaken by the National Infrastructure Commission. Improvements to transport infrastructure in and around Essex are vital to unlock growth in the London City Region and connecting London businesses and communities to these centres of economic opportunity, international gateways and key labour markets.**
2. **Given the key role that infrastructure in Essex (for example London Stansted airport, the M11, A12, West Anglia Mainline and Southend airport) play in enabling growth in the Capital, we would be delighted to provide further evidence to the Committee in person.**
3. Greater Essex connects businesses across London and the South East to world markets through airports at London Stansted and Southend and major port clusters in South Essex and Haven Gateway. It also provides a labour force of more than 149,000, contributing some over £10bn per year to the capital's economy. However, to sustain this connectivity our infrastructure needs investment.
4. The rail network in Essex that connects commuters to London and beyond is already operating at capacity, on the West Anglia Mainline [WAML] journeys between London and Stansted airport are longer than some of the flights to destinations the airport serves, reducing the attractiveness of this as a place to live, work and travel from and to.
5. Our ports are some of the largest in the Country connecting businesses to London but, without investment in the surrounding road and rail network we risk being left behind as logistic operators choose elsewhere with better, more reliable connectivity.
6. Stansted Airport is the only major airport in the Southeast that has the immediate capacity to grow within its existing permissions. It has capacity to take a further 13 mppa, from 22 mppa to 35 mppa within current planning permissions and has permissions to operate 264,000 Air Traffic Movements (ATMs) per year (243,500 passenger ATMS and 20,500 cargo ATMs) without the need for major further capital investment in the airport. However, improvements to surface access will be required.
7. Southend airport already has the immediate capacity to grow within its existing permissions. It can double from 1 million passengers per annum (mppa) to 2 mppa within current planning permissions and has permissions to operate 53,300 Air Traffic Movements (ATMs) per year without the need for major further capital investment.
8. However, whilst both airports have the capacity to grow within existing permissions and realise wider economic benefits for the London-City region, they are constrained by surface access.

9. Stansted airport is constrained by capacity on the strategic road network particularly the M11 J8, A120, M11 J8 – J9 and A14. It is further constrained by capacity, reliability and journey time of the West Anglia mainline “Stansted Express” service from London Liverpool Street. Southend airport is constrained by the capacity and reliability of the A127.
10. The Dartford Crossing is the only fixed road crossing of the Thames east of Greater London, however it is the busiest estuarial crossing in the United Kingdom, with an average daily use of over 150,000 vehicles.
11. Our response lays out our proposals on improvements to transport infrastructure in the London City-Region for consideration by the Commission and centres on opportunities in the following areas:
 - **West Anglia mainline four-tracking** - along the Lea Valley between at least Tottenham Hale and Broxbourne. However, Essex County Council supports the view of Harlow District Council that a feasibility study is required to explore the option of extending Crossrail 2 and 4-tracking to Harlow Town station. Overall Harlow has an increasingly important economy, with the success of their Enterprise Zone, and the relocation of Public Health England. At the same time the town has major ambitions around housing growth, which will support growth locally and within the London labour market. Harlow Town station also has existing and capacity for further stabling for trains. Four-tracking would provide rail capacity to bring forward the delivery of 6,000 – 12,000 new homes and 2,000 – 5,000 additional jobs to support growth along the Lea Valley and wider London Stansted Cambridge corridor and, to enable a London – Stansted journey time of 30mins.
 - **A120 corridor dualling** – we ask HM Government to consider our specific proposals on dualling the remaining sections of the A120 between Braintree – A12 and Hare Green to Harwich; the ports and logistics sector in this corridor has a turnover of £3bn per annum and employs over 32,000 people. With investment, the economy could grow by £1.3bn.
 - **Capacity improvements to M11 J8** – the junction is already at capacity and improvements would support growth at Stansted airport, unlock opportunities for local housing growth and improve connectivity between London, Stansted and Cambridge.
 - **Creation of M11 J7a** – to provide stronger links between London and Stansted airport and between the capital and the economic opportunities that exist within the Harlow Enterprise Zone.
 - **Upgrading of the M11 north of the airport between J8 – J9** – to provide stronger and more efficient links between Stansted airport, and the economic opportunities between London, Stansted and Cambridge.

- **A127 improvements** – the A127 has significant capacity and reliability issues, as highlighted in the Inner Thames Estuary [ITE] Study on Surface access, and flows which need to be addressed if it is to maintain current jobs and aid the delivery of new jobs and housing growth along the corridor. The A127 carries in excess of 70,000 vehicles per day which exceed those on many urban motorways elsewhere in the UK.

12. We are pleased that the importance of infrastructure is being considered by the Commission. Our evidence shows that there are already examples of ambitious projects based on robust understanding of local needs and that demonstrate joint working across a range of partners.

Cllr Rodney Bass
Cabinet Member for Infrastructure

Cllr Kevin Bentley
Cabinet Member for Economic Growth

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

- 1.1 Covering an area more than twice the size of Greater London, Essex has diverse strengths and is positioned to exploit an equally diverse range of opportunities. The county provides an excellent location for connecting businesses to centres of economic opportunity, including London, and internationally via the London Gateway and Harwich ports, and Stansted and Southend Airports.
- 1.2 Being so well located means that Essex is a significant contributor to growth; currently it supports 677,750 jobs; some 76,750 businesses. In 2013, Essex's businesses generated Gross Value Added (GVA) of £32.5 billion.
- 1.3 The commuting relationship between Essex and London is reciprocal; each year 149,000 Essex residents commute into London which approximates to £10.4bn GVA whilst 38,800 London residents commute to Essex which approximates to £2.7bn GVA per year¹.
- 1.4 By 2021 we are planning for over 117,745 new jobs; and over 81,310 new homes. Independent projections suggest that Essex will experience substantial demographic growth between 2014 and 2021. Analysis of 2013-based forecasts from the East of England forecasting model for the period 2014-21, suggest that Essex can expect to see growth in:
 - overall population of around 71,000 (4.9%);
 - the working age-population of 13,000 (1.4%); and
 - the number of households of some 33,000 (5.5%).
- 1.5 This amount of growth will exert pressures on our infrastructure, not only transport but education, health and social care and digital connectivity.
- 1.6 Due to the inter-connected relationship between Essex and its neighbouring counties and London growth in these areas will also affect our economy. For example the Upper Lea Valley is forecasted to generate 15,000 jobs and 20,000 new homes by 2021² whilst London Riverside is forecast to generate 16,000 jobs and 26,500 new homes.³
- 1.7 To keep businesses and commuters moving between Essex, London and beyond and ensure strong economic growth significant infrastructure investment is required:
 - improvements to surface access at Stansted airport – would enable the airport to grow its capacity;
 - the Lower Thames Crossing – would relieve congestion and speed up logistics;
 - a comprehensive solution to the lack of capacity at Junction 30/31 of the M25;
 - corridor improvements on the A12, A120 and M11 (including Junction 7a) – to connect centres of economic opportunity;

¹ Regeneris (2015) *Greater Essex External Economies Commission – Economic Linkages*

² City in the East

³ City in the East

- capacity improvements and integrated transport initiatives on the Great Eastern Mainline (GEML), West Anglia Mainline (WAML) (including 4 tracking) and opportunities offered by Crossrail 2 – to improve commuting and reduce journey times to London Stansted and London Southend airports and;
- investment in the London Underground Central Line and rolling stock, including station travel planning and interchange enhancements at Epping, Loughton, Buckhurst Hill, Chigwell and Roding Valley Stations – to improve commuting and support the night-time economy.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- **How should they be prioritised, taking account of their response to London’s strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

2.1 We believe that future investment in large-scale transport infrastructure improvements in Essex will support growth in London and across the South East.

2.2 Essex County Council has identified four growth corridors where investment could help stimulate and support growth:

- London Stansted Cambridge Corridor (M11 and West Anglia Mainline)
- Haven Gateway (A120)
- Heart of Essex (A12 and Great Eastern Mainline)
- Thames Gateway South Essex (A127, A13 and Essex Thameside Mainline)

London Stansted Cambridge Corridor (M11 and West Anglia Mainline)

2.3 The west of Essex is part of the London-Stansted-Cambridge Corridor (LSCC), connecting London, Stansted and Cambridge, via the M11 and the West Anglia Main Line (WAML). The Corridor has enormous growth potential, particularly in Harlow, building on the local strengths in life sciences and other high value sectors for example Public Health England is moving its headquarters to Harlow.

2.4 London Stansted is the only airport in the South East with immediate capacity for significant growth. With a current planning application to support 35m passengers per year (up from 20m currently), there is capacity to increase this to 45m passengers per year by 2030. This could create an **extra 10,000 jobs** and **£4.6bn in additional economic activity**.

2.5 London Stansted airport is already successful in the leisure and tourism but future plans focus on attracting more business customers and increasing the number of long haul flights. The growth of both of these areas could provide a catalyst for growth across the East of

England, attracting inward investment and supporting key sectors such as life sciences (amongst others).

- 2.6 London Stansted is also a key handler of freight, handling 220,000 tonnes last year (the third biggest after Heathrow and the East Midlands) and there is potential with surface access improvements to grow this market as well.
- 2.7 Surface access improvements are critical to growth at Stansted Airport. The Airport will not be able to realise its true potential without investment in the following:
- M11 improvements focusing on junctions 7 and 8
 - A120 improvements, improving connections between the Haven Ports and the Airport
 - Four-tracking of the West Anglia Mainline, which will result in faster journey times from London
- 2.8 The Harlow Enterprise Zone provides a focal point for key sectors of significance to the UK and sub-regional economy including life sciences, advanced manufacturing and ICT with the potential to deliver over 51 hectares of employment land. Delivery has the potential to create over **5,000 jobs** and lever in over **£150 million in private sector investment**.
- 2.9 Improvements to M11 J7 and delivery of M11 J7a are required to realise the site's full potential.
- 2.10 It is hoped that Crossrail 2 will bring the desperately required four-tracking of the West Anglia Mainline to the London Stansted Cambridge Corridor and this should be prioritised.

Haven Gateway (A120)

- 2.11 The Haven Gateway Growth Corridor includes the districts of Braintree, Colchester and Tendring, and links Harwich International Port in the east to Stansted Airport and the M11 in the west via the A120. It is one of the key international gateways to the UK; home to Harwich International Port, one of the UK's leading multi-purpose freight and passenger ports, and supporting the neighbouring port of Felixstowe.
- 2.12 There is significant potential for growth at Harwich Port. Harwich has the potential to make a significant contribution to the offshore energy sector and is already supporting over 260 turbines, more than any other UK North Sea Port. It is well located at the centre of Europe's offshore wind activity and provides the sheltered conditions to support the growth of the offshore renewable sector. Harwich has recently been designated as a Centre for Offshore Renewable Engineering (CORE). This will provide additional support for businesses looking to invest in manufacturing for the offshore renewable energy industry, helping this sector to grow.
- 2.13 In the longer term, Bathside Bay has the potential to create a deep sea container port with road and rail links to the rest of the country. Around 101h additional land adjacent to Harwich Port is available which could attract **£300 million investment** and create at least **500 direct jobs** and many more indirect employment opportunities.

- 2.14 The **A120** links London Stansted Airport with Harwich International port and the local economies of Braintree and Colchester. Improvements along this route has significant potential to secure employment and housing growth along this corridor. It will connect the local workforce to two key international gateways and drivers of growth for Essex. Without the required improvements to the A120, the region will lose out on £1.3bn in growth and nearly 13,000 new jobs.
- 2.15 ECC is leading on the design and preparatory work for improvements to the A120, however firm commitment from Government to fund the scheme is required to ensure success.

Heart of Essex (A12 and Great Eastern Mainline)

- 2.16 The Heart of Essex growth corridor runs through the centre of Essex, linking London to the Haven ports, and onwards to Norfolk and Suffolk. The A12 and the Great Eastern Main Line (GEML) rail services link the key urban centres of Brentwood, Chelmsford, Colchester and Maldon to London.
- 2.17 The corridor has strong links with the London labour market, supporting substantial commuter flows to and from the capital. These links will grow and strengthen as Crossrail is completed, when new services will stop at Brentwood and Shenfield, both of which will benefit from planned improvement works to facilitate these new services
- 2.18 Additional investment in rail and road infrastructure is essential for unlocking the full economic potential of the Corridor, and a package of investment is proposed to address bottlenecks on the A12 to support growth.

Thames Gateway South Essex (A127, A13 and Essex Thameside Mainline)

- 2.19 The districts of Basildon, Castle Point and Rochford, along with the unitary authorities of Thurrock and Southend, form Thames Gateway South Essex (TGSE); part of Thames Gateway, the largest regeneration opportunity in Europe. Along this corridor the A13 links the key port infrastructure of Tilbury and London Gateway with London, while the A127 corridor connects the capital to the manufacturing hub of Basildon, and to Rochford, Southend, London Southend Airport and surrounding employment areas. Improvements to the road network in this area are vital to securing growth and inward investment.
- 2.20 London Gateway is the UK's first major deep sea container port and Europe's largest logistics park. It will provide access to the largest consumer markets in the UK and internationally. A significant port development for the UK, it occupies a 1,500 acre site and will provide 2,700 metres of quay and six deep water berths. The logistics park could provide nearly 1 million m² of accommodation. Together the development has the potential to create more than 12,000 direct, permanent jobs and more than 20,000 indirect jobs. The site is supported by the country's largest Local Development Order, developed by Thurrock Council to give confidence to occupiers to invest.

- 2.21 Port of Tilbury is one of the largest deep water ports on the River Thames and is the UK' leading port for forestry products with excellent links throughout the supply chain including shipping lines, importers, merchants and distributors. Work is currently underway to develop more than 940,000 sq. ft. of new high quality distribution facilities and 17 acres of haulage facilities adjacent to the port of Tilbury. The London Distribution Park development is expected to generate up to 1100 jobs and secure the long term prosperity of the port.
- 2.22 London Southend Airport has been one of Europe's fastest growing airports in recent years with over 1 million passengers in 2014. It has received over £130 million of investment since it opened in 2008, mainly from the private sector. A Joint Area Action Plan (JAAP) sets out detailed proposals for the development of London Southend Airport and the surrounding area. The Airport itself has capacity to support up to 5 million passengers per annum and 2 million by 2030. By 2021 it is expected that the airport will support an additional 2,000 jobs.
- 2.23 There is significant potential for growth, not only at the airport site but in areas surrounding this key hub. The Airport Business Park (ABP) to the North West of the Airport will create a million sqft of high quality employment space and over **6,000 jobs**. The proposals include a site for the Anglia Ruskin Medtech campus, which will create space and support for businesses in the medical technologies sector.
- 2.24 Currently, development is constrained by the limited capacity of the strategic road network, particularly J30/31 of the M25 and the dual carriageway stretch of the A13. The A127 also carries a volume of traffic comparable to a motorway in other parts of the country and has significant capacity issues which need to be addressed, particularly around Basildon, London Southend Airport and the Southend Central Area. Southend Borough Council and Essex County Council have developed a joint "A127 Corridor for Growth" economic plan to identify, plan and coordinate investment decisions and manage the asset.
- 2.25 The **A127** corridor which connects Basildon with Southend is vital to the economic competitiveness of the Thames Gateway South Essex sub-region and indeed to the economy of the County of Essex and beyond. It is located in the heart of the Thames Gateway which has been identified as being of national significance. Thames Gateway South Essex has an ambitious growth agenda to build on existing strengths and make the most of a unique combination of opportunities. Investment to improve capacity and flows along the A127 is therefore required to secure jobs and housing growth.
- 2.26 Bordering London to the west, the **A13 corridor** links the key port infrastructure of Tilbury and London Gateway with the capital. The corridor provides a significant growth opportunity and already benefits from major planned and committed private investments such as London Gateway (£1.5bn), Thames Enterprise Park (£1bn), Lakeside (£1bn), Purfleet (£600m) and Canvey Gateway (£110m). With the right investment, the A13 corridor will deliver 4,150 homes and 11,000 jobs by 2021. However, the road is currently constrained by its capacity. To unlock this growth potential, local authorities will invest £300m, however additional funding is required (in the region of £87 million).

2.27 Furthermore, the potential impact of the Lower Thames River crossing would be significant on transport routes in this corridor, with one of the two short-listed options being to connect the M2 in Kent with the A13 and the M25 between junctions 29 and 30.

2.28 In summary our priorities for investment are:

- **A127 improvements** – the A127 has significant capacity and reliability issues, as highlighted in the Inner Thames Estuary [ITE] Study on Surface access, and flows which need to be addressed if it is to maintain current jobs and aid the delivery of new jobs and housing growth along the corridor. The A127 carries in excess of 70,000 vehicles per day which exceed those on many urban motorways elsewhere in the UK.
- **Lower Thames Crossing** – another crossing is required to ease congestion across the Queen Elizabeth II Bridge and provide resilience in the area.
- **A120 corridor dualling** – we ask HM Government to consider our specific proposals on dualling the remaining sections of the A120 between Braintree – A12 and Hare Green to Harwich; the ports and logistics sector in this corridor has a turnover of £3bn per annum and employs over 32,000 people. With investment, the economy could grow by £1.3bn.
- **A12** – we are working closely with Highways England to design the improvement schemes announced in the 2014 Autumn Statement.
- **Creation of M11 J7a** – to provide stronger links between Stansted airport and the economic opportunities that exist for Growth within the Harlow Enterprise Zone.
- **Capacity improvements to M11 J8** – improvements on this already at capacity junction would support growth to Stansted airport as well as providing opportunities for housing growth locally.
- **Upgrading of the M11 north of the airport between J8 – J9** – to provide stronger and more efficient links between Stansted airport, and the economic opportunities that exist for Growth within the Harlow Enterprise Zone, Cambridge and wider region.
- **West Anglia mainline four-tracking** - along the Lea Valley between Tottenham Hale and Harlow to provide rail capacity to bring forward the delivery of 6,000 – 12,000 new homes and 2,000 – 5,000 additional jobs to support growth along the Lea Valley and wider London Stansted Cambridge corridor and, to enable a London – Stansted journey time of 30mins.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

3.1 We believe that delivering four-tracking of WAML outside of the Crossrail 2 programme would lead to an increase in benefits as commuters and airport passengers could travel more easily and reliably to and from the capital.

3.2 Further, there is potential to reduce costs by undertaking a scoping study into extending four-tracking and Crossrail 2 services to Harlow Town Station where there are marshalling and servicing facilities for trains already present that TfL could use.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

4.1 We have a strong track record in forward funding and part funding large scale infrastructure projects and would be happy to share this knowledge and experience with the Commission.

4.2 As well as leveraging investment from local authorities, businesses, developers and (in the case of rail) operators we see no reason why additional taxation (enabled by Business Rate Legislation) could not be used to part fund significant infrastructure projects such as Crossrail 2 or a new Lower Thames Crossing. This has already been successfully applied for the funding of Crossrail and the London Olympics.

4.3 There is a robust evidence base to support the use of user charging to recoup the construction costs and pay for ongoing maintenance of road and river crossing infrastructure projects. This approach should not be discounted.

National Infrastructure Commission – Call for Evidence

Subject: London’s Transport Infrastructure – **Connecting East London – Low Level River Crossings**
To: National Infrastructure Commission (londonevidence@Infrastructure-Commission.gsi.gov.uk)
Prepared by: Farrells and BuroHappold Engineering
Date: January 7th, 2016

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London’s population growth has accelerated to an extent much greater than anticipated, to a Victorian rate of change. A year ago, London’s population surpassed its 1939 peak of 8.6 million and latest predictions foresee London’s population exceeding 10 million by 2035. This creates opportunities, but also brings with it major challenges. London is one of the most thriving and growing urban economies. It is a centre for innovation, creativity, and culture. In order to remain the global city London is today and to lead the world in sustainable, resilient urban growth, London however needs to address its **most pressing challenges: Housing and infrastructure provision for a growing population and economy, social and economic inequality, and the impacts of climate change.**

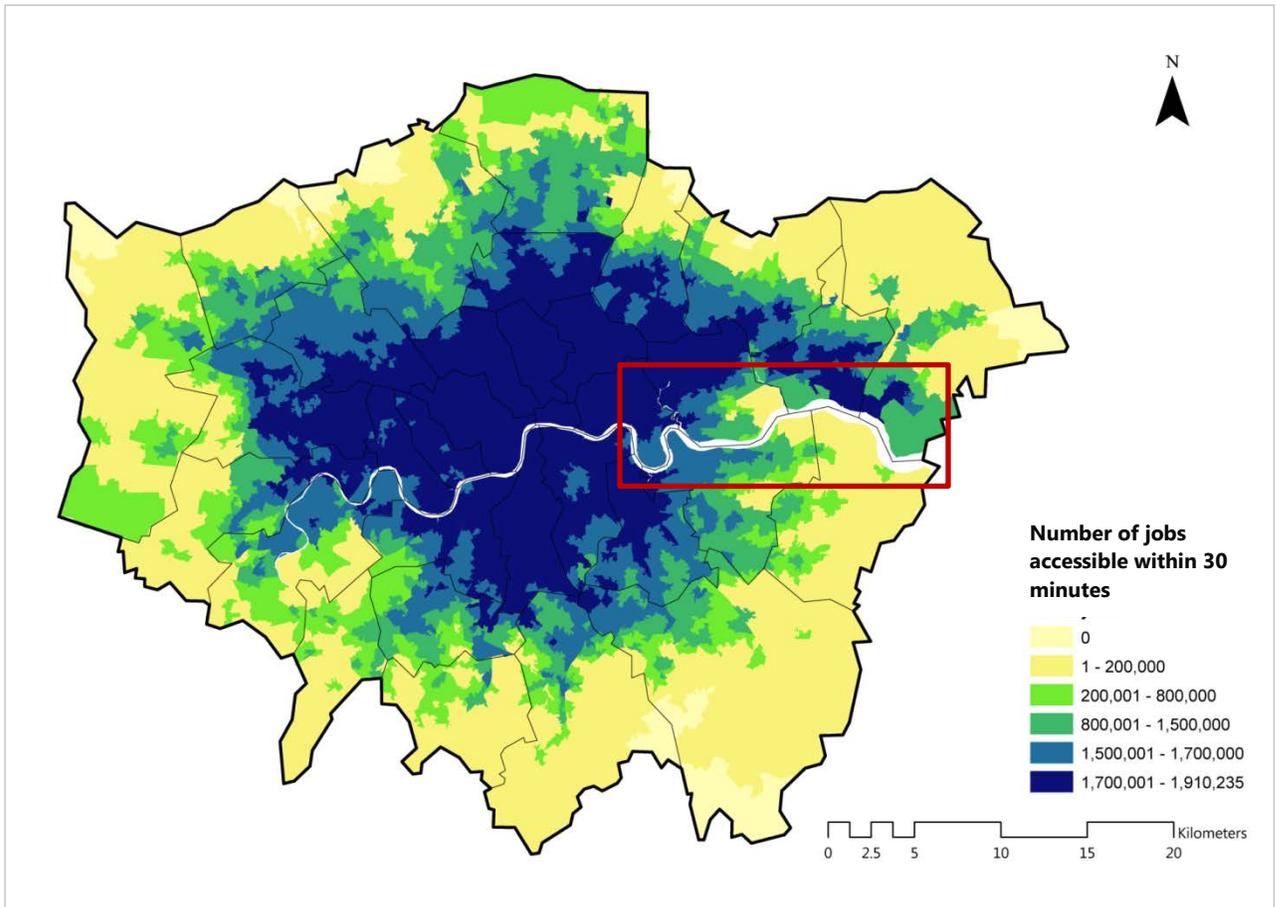

Providing **housing** for those already in London and its future population growth is one of the key challenges that London faces today. Official estimates assume the need to build almost 50,000 homes a year over the next twenty years, supply levels far beyond those currently achieved. With local authorities reducing or abandoning their housebuilding activities since the early 1990s, the private sector and housing associations have not managed to build more than 20,000 units per year on average. Moreover, London needs to provide these **homes for all income levels**. Around 70% of all homes need to be affordable – social rented housing, intermediate housing, and housing in the lowest market band – according to estimates. London has only managed to build around 2,000 homes for social and affordable rent per year since 2008.

Solving the housing crisis is as much about new housing policy, innovative financing and governance mechanisms, and technical innovation as it is about **spatial planning and unlocking land for development**. The GLA and TfL have responded to this with bold infrastructure projects, from the London Overground to Crossrail; and there are further ambitious plans (e.g., Crossrail 2) to increase accessibility of underserved areas in London. This will support both employment creation and home building at increased density. However, more needs to be done, across London

In recent times it has become clear that only **East London** has the spatial capacity and ability to accommodate growth on a larger scale. Shoreditch and Hackney have become desirable places to live and work whilst Canary Wharf has become a major finance centre with a mix of shops, homes, and a cultural offer with superb connectivity. The London Olympics Legacy has helped support growth in Tower Hamlets and Newham and the Royal Docks is at last attracting sustained investment. However, large areas of East London have seen little or no growth. A lack of transport accessibility (see Figure 1) has held back housing delivery in

East London and too much has consisted of low-density sprawl in featureless dormitory suburbs. While the London Plan identifies East London as the area with the greatest potential for growth (40% of the opportunity areas), it will be hugely challenging to find investors if land is not unlocked by making it more accessible to employment throughout London and the south east.

Figure 1: Accessibility to jobs

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

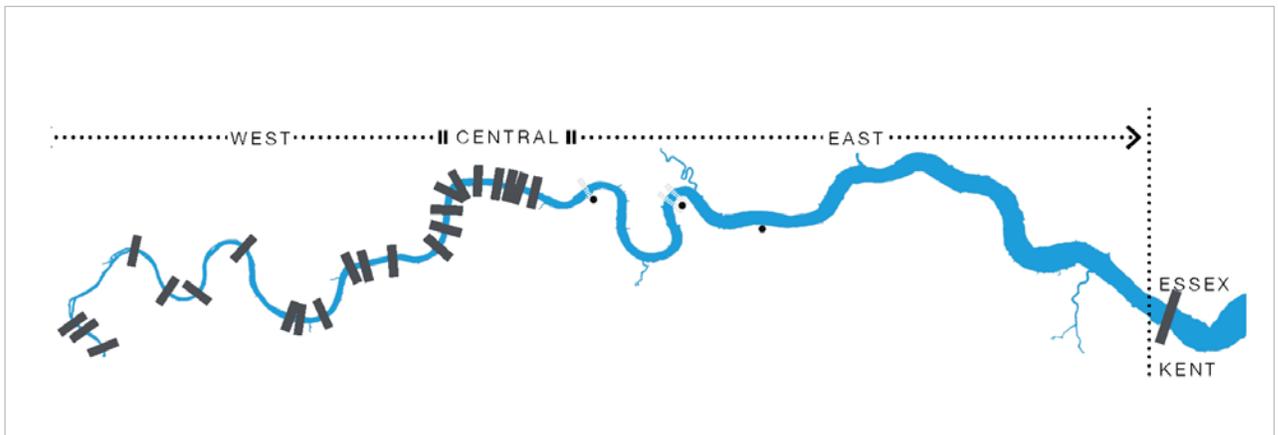

To address the challenges outlined above, **new river crossings in East London** should be part of any future investment in infrastructure improvements. TfL has started investigating different options and is preparing for the planning and construction of strategic through traffic crossings such as the Silvertown Tunnel, a crossing at Gallions Reach, and one at Belvedere. While necessary, these crossings will however not be sufficient to address the local accessibility needs of local communities that are being planned and built in East London. Moreover, these crossings – currently conceptualized as tunnels and high-level bridges – will sterilize large areas of land on either side of the river due to their long approach ramps, often stretching a mile back from

the river bank. Future investment in transport infrastructure therefore needs to include the building of **low-level bridges and other local crossings such as high frequency ferry services in East London**, enabling walking and cycling and conveniently connecting people to transport nodes on either side of the river – effectively extending the network of transport connections to the river.

Historically, West London grew and flourished because areas north and south of the river were connected by bridges, improving connectivity and unlocking new land for development. To provide one example: In 1842, the Commission of Woods, Forests, and Land Revenues recommended “the building of an embankment at Chelsea to free new land for development, and proposed the building of a new bridge downstream of Battersea Bridge” (Roberts, C. 2005. Cross River Traffic. London: Granta, p. 130).

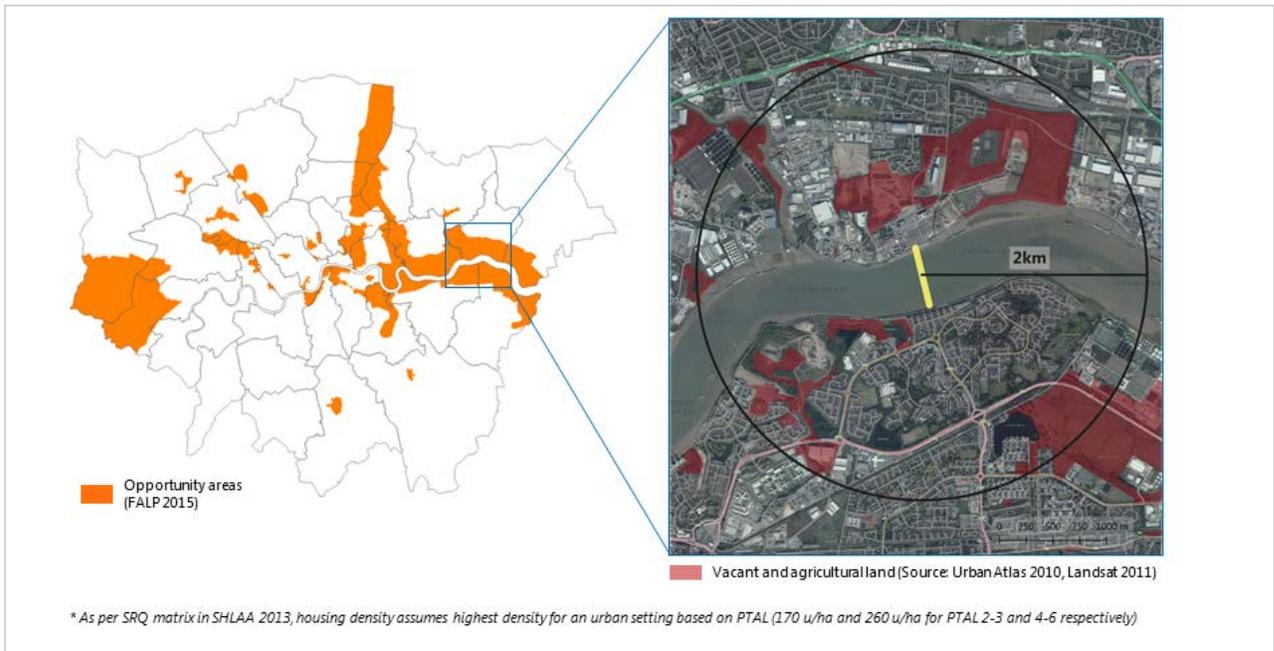

Currently, there are 34 bridges across the Thames, but **only one bridge east of Tower Bridge** – the high-level bridge at Dartford (see Figure 1).

Figure 2: Bridges across the river Thames

Building local crossings will help unlock land for housing development and improve job accessibility for existing and future communities. Analysis suggests that within a 2km radius of a potential bridge connecting Thamesmead with Barking Riverside, almost 50,000 new homes could be built (see Figure 3) – this is one year of the housing supply currently required for London’s growth. A bus connection over the bridge that would link Abbey Wood Crossrail station in the south with the future Barking Riverside Overground station in the north would increase job accessibility for existing and future communities in the area.

Figure 3: Housing capacity in Thamesmead / Barking Riverside

Low-level bridges will allow private and public developers to take advantage of increases in land value to **create vibrant urban communities** along the river front and further inland. It will re-connect settlements on the North and South banks with the Thames and **enhance the East London riverfront** through landscape restoration and the animation of the waterfront with shops, cafes, and public spaces for people to linger, walk, and enjoy. This addresses one of the key goals in the current Port of London Authority Vision (i.e., "Riverside as a magnet for ramblers, historians, artists, and others", PLA Thames Vision Consultation on Goals and Priority Actions, Dec 2015).

Low-level bridges will also help **reduce pressure on over-burdened parts of the transport network** by **providing sustainable alternative modes of transport**. With the development under way in North Greenwich and the Royal Docks, a low-level bridge could increase crossing capacity. TfL's *River Crossings: East of Silvertown Crossings* (Jul 2014) report demonstrates the need to increase capacity of the Woolwich Ferry crossing. It also shows that this crossing is mainly used by people originating in the boroughs north and south of the river. A low-level bridge will reduce the pressure on the Woolwich Ferry. It will also help achieve TfL's goal of reducing dependence on road-based transport and improve air quality. The same report indicates that road-based travel in East London is the main transport mode in connecting people to employment. Low-level crossings will improve the infrastructure for alternative modes of transport such as walking and cycling.

We are fully aware of the **challenges that low-level bridges pose to river traffic**. The River Thames poses several constraints due to its topography and its tidal nature. It requires highly experienced pilots to manoeuvre ships and the more obstacles in the river, the more difficult it becomes to manoeuvre. We are also aware of the cultural, environmental, and economic importance of the river traffic. In 2014, the port handled 44.5 million tonnes of goods and materials and provided direct employment for 27,000 people. 5.5 million goods and materials were moved between the wharves on the river, taking 550,000 lorry trips off the region's road (PLA Thames Vision Consultation on Goals and Priority Actions, Dec 2015). This reduces congestion on London roads, increases road safety, reduces greenhouse gas emissions, and improves air quality.

Taking these challenges into account, we however strongly believe that by exploiting today's smart traffic systems and the variety of designs for opening bridges, **both interests can be served; creating vibrant communities in East London while achieving PLA's goal of being the busiest ever Port of London.** Examples of other cities might be able to teach us something (see section 5 below).

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Low-level bridges **can be more affordable** than high-level bridges and tunnels. Rough costing of a potential bridge between Thamesmead and Barking Riverside allowing for cycling lanes, walking space, and a one-way bus lane supported by sensors and lights showed that bridge construction between banks could be under £150 million – about fifty percent less than a high-level bridge (this does not include additional costs beyond the banks with approach works and ramps). This would potentially also be cheaper than TfL's idea of an Overground tunnel extension from Barking Riverside to Thamesmead (TfL, *New river crossings for London*, Dec 2015). A more detailed analysis and costing would of course have to be undertaken in order to move forward.

One of the fundamental principles that should govern infrastructure funding is that those that benefit most, should help pay for it. In regards to a low-level bridge, this **benefactor-pays** principle can be achieved through tolls by those using the bridge (especially if vehicles are allowed), land value capture mechanisms whereby land owners and developers are charged a fee as they are benefiting from increasing property values, or through business rates whereas businesses that profit from increased economic activity are charged a fee. The appropriateness of each of these financing mechanisms depends on the users the bridge serves (e.g., public transport, private vehicles) and the location (e.g., it might be easier to get funding from developers in locations where investment interest is already existent than in locations where land still needs to be unlocked).

There is also a **rationale for public investment** as the socio-economic benefits of regeneration in a traditionally deprived and underserved area as well as the opportunity to unlock land for much needed housing largely outweigh the costs involved. Contributions from national government and the GLA would demonstrate their commitment to a more balanced growth in London. Boroughs could make contributions as they will benefit from tax revenue growth from increased economic activity and population growth.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

While we appreciate that each city deals with different opportunities and challenges and each river has different physical constraints, there are examples that show how local bridges can improve accessibility and unlock development and how the technology of opening-bridges can work in other cities.

Baakenhafen Bridge, Hamburg

The Baakenhafen bridge in Hamburg is a local vehicle, pedestrian, and cycling bridge that connects two areas of the new district Hafencity and greatly increases accessibility to Hamburg's inner city. The construction of the bridge allowed for the development of 1,800 housing units, shops, offices, and community spaces. Without the bridge, development would have been much harder to achieve.

Ponte della Musica, Rome

The Ponte della Musica crosses the river Tiber in Rome and connects the former Olympic stadium on the west bank of the river with the Quartiere Flaminio for the first time in a 1,000 years. The bridge was designed to

serve as an open public space that can be used for festivals, exhibitions and fairs. It also has the facility to operate as a tram and bus route. It connects Rome's most significant cultural institutions and provides ease of access for residents to enjoy these institutions fully.

The New Botlek Bridge, Rotterdam

The new Botlek bridge across the Oude Maas in Rotterdam is an example of advanced bridge technology. It is one of the largest moveable bridges in the world. The bridge will be opened around once every hour, or 9,000 times per year and only 120 seconds are required for the entire opening or closing procedure. The bridge will remove a bottleneck for ships, caused by the existing low and narrow moveable bridge's limited navigation clearance while also improving the flow of road traffic.

Kattwyk Bridge, Hamburg

The Kattwyk bridge across the South Elbe in Hamburg is an opening bridge across a tidal and curvy river that opens during the day every two hours for river traffic. Built back in the 1970s, the opening mechanisms is not as fast as the new Botlek bridge and disrupts vehicle traffic across the river for about 15-20 minutes each time.

January 2016

Dear Sir/Madam,

National Infrastructure Commission: Call for Inputs

FSB welcomes the opportunity to respond to the above named consultation.

The FSB is the UK's leading business organisation. It exists to protect and promote the interests of the self-employed and all those who run their own business. The FSB is non-party political, and with around 200,000 members, it is also the largest organisation representing small and medium sized businesses in the UK.

Small and medium-sized businesses make up 99.9 per cent of all businesses in the UK, and make a huge contribution to the UK economy. They account for 47 per cent of private sector turnover and employ 60 per cent of the private sector workforce.

Transport infrastructure is vitally important to small businesses across the country. Small business owners in the North, London and across the UK report a range of challenges they face which are hindering the economic development of their business. If the National Infrastructure Commission is able to improve the planning and delivery of major infrastructure projects, small businesses will have greater opportunities to expand and compete internationally.

We trust that you will find our comments helpful and that they will be taken into consideration.

Yours sincerely,

Mike Cherry, Policy Director, AIMMM FRSA

FSB

FSB response to the National Infrastructure Commission: Call For Inputs

January 2016

The evidence submitted to this call for inputs is primarily based on surveys carried out on a survey panel of our members. The FSB Big Voice survey panel is made up of nearly 6000 small business owners, who are regularly surveyed on a range of different policy issues. This survey panel is broadly representative of the wider small business community. Surveys are administered by an independent research agency which is a signatory of the Market Research Society's Code of Conduct.

FSB also receives views from our members via a federated regional structure which allows small business owners across the country to raise areas of concern to them at a national level. For the purposes of responding to this call for inputs, we spoke to representatives of the FSB in regions across the North and in London, in order to ensure we accurately represented the views of small business owners.

CONNECTING NORTHERN CITIES

1. To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?

Improving the transport connections in the North is a top priority for FSB. Weakness in transport connectivity is holding back growth among small businesses in northern city regions.

The agglomeration benefits which firms in London and the South East derive from a generally strong transport infrastructure are not delivered for smaller businesses across the North. This makes it increasingly difficult for smaller businesses in the North to compete. Without further investment in transport infrastructure to bring Northern regions together, it will remain challenging for smaller businesses to develop in the North.

The APPG on Small Businesses – supported by FSB - published a report into the drivers of productivity in March 2015. This inquiry took evidence from a range of different stakeholders, finding that a lack of transport connectivity hindered productivity levels in different regions.¹

We would highlight the wide discrepancies in per capita infrastructure spending between the North and other regions of the UK which have been found by IPPR North.² This points to a broader issue with historic levels of under-investment in northern infrastructure having left the region relatively underdeveloped and with poor intra-regional connectivity.

Small business owners have also pointed to a lack of transport infrastructure as holding back their ability to connect with suppliers, customers and employees, particularly in rural areas. The declining quality of public transport and generally poor upkeep of the minor road network

¹ APPG on Small Businesses Report on Productivity: Available at http://www.millionplus.ac.uk/documents/All_Party_Parliamentary_Small_Business_Group_Productivity_and_Small_Firms_productivity_report.PDF

² IPPR North, Transformational Infrastructure for the North, August 2014

has meant that rural small businesses can struggle to compete against national and international competitors which have access to superior transport networks.

We would therefore urge the Commission to not just focus on urban and city to city transport infrastructure, but also to consider travel to work routes between cities and the rural hinterlands where many small businesses, their customers and their employees are based.

2. What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.

In a recent survey, FSB asked small business owners what modes of transport were of importance to their business. The results were as follows:

Table One: How important are the following modes of transport to your business?³

	Car	Van	Lorry	Bus	Train	Walking	Cycling
Important	93%	64%	49%	32%	33%	39%	22%
Unimportant	2%	12%	20%	27%	28%	24%	32%

We also asked how important road access was to their business, and how important the public transport network was to their business.

Table Two: How important is the road network / public transport access to your business?⁴

	Road network	Public transport
Important	88%	36%
Unimportant	3%	30%

It is clear that the vast majority of small businesses still rely heavily on the road network for their cars, vans and lorries. This is reflected in the high importance attributed to both the road network and for private car, van and lorry use.

However, public transport is important to a significant percentage of small business owners, where over a third still place value on access to public transport. Close on half of businesses in urban areas (48%) were likely to view public transport as being important, reflecting the benefits that a well functioning urban public transport network can provide.

³ FSB Big Voice survey, Rural Transport, September 2015. Base 1352 responses

⁴ FSB Big Voice survey, Rural Transport, September 2015. Base 1352 responses

For reference, and outside the scope of this section of the call for inputs, 65 per cent of London based businesses value the public transport network, providing further evidence that where public transport works, it provides an important service for small businesses.

Investment in the road network is therefore the most important priority for small business owners. This should not simply reflect investment in the Strategic Road Network or city to city links, but should also include the minor roads which form a key part of the door to door journey for small business owners, their suppliers and their employees.

We also note that many inter-city rail connections continue to rely on old rolling stock and carriages which can hinder capacity. Making additional investment in upgrading the rolling stock used on these routes could be more effective in increasing capacity than making larger scale investments in new or upgraded routes.

3. Which city-to-city corridor(s) should be the priority for early phases of investment?

FSB has argued in previous submissions to the Chancellor that a new tunnelled, trans-Pennine road route between Manchester and Sheffield would provide an important new city-to-city corridor in the North.

Many small businesses are not however based in cities, and do not necessarily place high value on access to city-to-city corridors. Instead, they look to the transport network to connect rural and semi-urban areas to city and town centres.

There is widespread concern among small businesses that new devolution deals will primarily benefit cities rather than the rural hinterland. It is important that existing, and future, devolution deals include mechanisms to ensure that the needs of rural areas are also addressed.

Small business owners in the North East also raised concerns that the 'Northern Powerhouse' will be primarily focussed on the Manchester-Leeds corridor. In their view, this would be a mistake as much-needed investment in the North East, including around Newcastle, would be missed. East to West connectivity across transport modes is as important to increase agglomeration benefits as connections through to London are.

As a federated organisation, FSB has not taken a position on specific infrastructure projects or city to city corridors, as small business owners across the North have told us that the general state of poor transport infrastructure is hindering the growth and economic potential of their business.

4. What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?

The top priority for FSB in terms of international connectivity is to improve runway capacity in the South East. We recognise that this is a decision which has been specifically excluded

from the remit of the National Infrastructure Commission. Setting aside the question of overall aviation system capacity, it is clear that more should be done outside the South East to improve international connectivity.

Whilst aviation is a lower priority for small businesses compared to the road and rail network, some small businesses do see it as important. FSB asked small business owners about how important air travel was to their business in a 2013 survey.⁵

This survey found that 27 per cent of small businesses placed at least some importance on aviation for their businesses. This importance could reflect the importance of access to freight opportunities, but could also reflect the value that some sectors, such as the tourism industry, place on aviation access. Other small business owners, especially those who export, will also often need to fly in order to meet with potential or existing clients and suppliers. Therefore continued improvements to regional airports and the destinations they serve is important.

A key issue which has repeatedly been raised is delivering improvements to surface access connectivity to airports. For small business owners, the time taken to complete a door-to-door journey is critical. This means the length of time taken to access any given airport is given weight when deciding on which airport to travel from. Business owners were especially critical of the poor surface access to Leeds-Bradford airport, which was viewed as a particular impediment in choosing to fly from there. Drop off charges at this airport are also expensive, which increases the cost of flying from this airport. The Commission should look to prioritise improvements to surface access to regional airports across the North as a key way to incentivise further export growth.

Digital infrastructure plays a key role in developing international connectivity

Digital connectivity does not appear to be within the scope of the Commission at the current time. We view this as a mistake, as digital connectivity is now critical to allowing small businesses to trade overseas. FSB has published extensive research looking at the benefits of digital connectivity, along with the barriers stopping small businesses from doing more online.^{6,7} Ofcom have echoed our findings that a lack of digital infrastructure is a key barrier stopping small businesses from making full advantage of the benefits offered by using digital tools.

As a consequence, we believe the Commission should consider investigating the provision of digital infrastructure, particularly to small businesses, as a future priority.

5. What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?

⁵ FSB The Voice of Small Business survey panel, Infrastructure Survey, April 2013

⁶ FSB, Reassured, optimised, transformed: driving digital demand, September 2015

⁷ FSB, The Fourth Utility, July 2014

One concern which has been raised following the creation of Transport for the North and the National Infrastructure Commission is the precise breakdown of roles and responsibilities for planning and delivering transport infrastructure in the North. The role of local councils, LEPs and combined authorities also may need clearer definition following these changes.

The failure of the Government to follow the recommendations of the Davies Commission on airport capacity raises broader issues about the effectiveness of a Commission-led model to deliver transformative infrastructure. If the Government is under no obligation to follow the recommendations of the National Infrastructure Commission, we are concerned that future Governments will simply erect barriers to avoid making a definitive judgement on any recommendations from this body. Without some form of safeguard such as a legal obligation to respond to recommendations within a certain timeframe we are unsure that the Commission will be effective.

Small business owners would like clarity over which body is best placed to address specific areas of concern aside from which body will be responsible for the delivery of transport infrastructure.

FSB has been generally supportive of the new devolution deals which are being created, and views the creation of strong combined authorities with the power and accountability to deliver local priorities as an important and welcome change.

However, one challenge for these new authorities will be the varying levels of power which has been devolved to them. For instance, in the transport space, some combined authorities have power over buses in their area, whereas others do not. As combined authorities proliferate, there is a risk that effective planning across regions may be hindered as different combined authorities have different powers to address different issues. This was viewed as a particular problem in the North East, where the lines of accountability and authority between national Government, combined authorities and Transport for the North were viewed as unclear.

A second challenge facing combined authorities is that stronger, more effective combined authorities will be better placed to compete for funding streams. While this makes sense from an accountability perspective, business owners are concerned that their region may miss out on investment opportunities if their combined authority consistently fails to put in competitive bids for funding. Regions or rural communities outside of combined authority areas similarly may be disadvantaged when competing for limited investment opportunities.

At the same time, we recognise that if a combined authority is able to make a strong case for investment in transport infrastructure in a particular region, this suggests they may be better positioned to effectively manage the delivery of infrastructure. The National Infrastructure Commission should play a role in ensuring that new projects are effectively prioritised to provide the greatest economic benefit to the country.

LONDON'S TRANSPORT INFRASTRUCTURE

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

FSB have published a London manifesto ahead of the 2016 Mayoral Election which sets out our policy priorities for the next London mayor.⁸ This manifesto highlights some of the challenges which small businesses in London are currently facing with regards to transport infrastructure.

Commercial and residential rents are increasing the pressure on the transport network

As commercial rents increase across London, we are concerned that small businesses will increasingly be priced out of prime locations, particularly those in central London. This will affect the ability of small businesses to access the economic benefits offered by being based in London.

Recent FSB surveys have also shown that there is considerable concern among small business owners about the cost of housing in the capital. 22 per cent of small businesses said that the cost of housing had negatively impacted their business over the past four years; 13 per cent said high housing costs had impacted their ability to retain staff and 7 per cent said it had affected their level of productivity.

Permitted developments rights, which have been encouraging the change in use for commercial buildings to residential properties will only serve to exacerbate the issue.

Assuming that house prices continue to push Londoners further away from the main areas of employment, small businesses will rely even more heavily on a robust, effective and integrated transport system to carry commuters to their places of work.

Capacity on London public transport is also becoming a constraint on growth opportunities

As London's population increases, capacity on the London transport network will similarly become increasingly constrained. This again will have a detrimental effect on the ability of small business employees to travel to and from work.

Public transport is very important to London-based small businesses, as this is a key way for customers, suppliers and employees to access business premises. Owing to London's dense public transport system, small business owners were significantly more likely to view public transport as more important to their business compared to business owners in the rest of the country.

⁸ FSB London manifesto, November 2015. Available at [HTTP://WWW.FSB.ORG.UK/DOCS/DEFAULT-SOURCE/FSB-ORG-UK/FSB_A4_LONDON_MAYOR_MANIFESTO.PDF?SFVRSN=0](http://www.fsb.org.uk/docs/default-source/fsb-org-uk/fsb_A4_LONDON_MAYOR_MANIFESTO.PDF?SFVRSN=0)

Table Three: How important is public transport to your business?

	London	UK
Important	65%	36%
Unimportant	17%	30%

44 per cent of small business owners in London viewed public transport access as 'very important' to their business, compared to just 14 per cent of small business owners nationwide.

Small business owners with businesses in London raised different issues when asked to select three top issues affecting their use of the road network when compared to business owners in other parts of the country.

Table Four: What are the top issues in the road network affecting your business? (three selected from list)

	London	UK
Congestion on local roads	63%	45%
Parking availability	35%	22%
Congestion on motorways	30%	26%

Congestion and a lack of parking were therefore viewed as the two main issues affecting London based small businesses. These results are significantly different to the views expressed by small businesses based in other areas of the country, who were more likely to view potholes and frequent road works as the most significant issues.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- **How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

The successful delivery of Crossrail 2 represents the main priority for FSB in terms of improving London transport. Funding for this project should primarily come from the private sector. Where public financing is necessary in the form of Business Rates Supplements, we

would like thresholds, similar to those put in place for the Crossrail I project, in order to exempt the smallest businesses from paying a supplementary charge.

More generally, FSB believes that the ability to raise business rates to pay for infrastructure projects should be contingent on the support of the wider small business community. A similar process to the adopted within the Business Rates Supplements Act 2009 should be considered for infrastructure financing.

Freight on Rail response to Call for Evidence to National Infrastructure Commission:

This is the Freight on Rail response to the National Infrastructure Commission (NIC) call for evidence on the terms of reference listed.

Freight on Rail, a partnership of the rail freight industry, the transport trade unions and Campaign for Better Transport, works to promote the economic, social and environmental benefits of rail freight to local, devolved and central Government in the UK and to the European Commission, Parliament and Council of Ministers.

Summary

In addition to the terms of reference, covered in our sections A, B & C, we would like to make key general points, which are not only relevant to all three NIC terms of reference but also to the vast majority of NIC future infrastructure schemes.

NIC needs to take into account the socio-economic benefits of rail compared to HGVs which impose high external costs on society which are not internalised. Government policy, as a whole including the NIC, should set equitable transport policy across the modes which takes into account these market distortions. (See section 6)

Our response is comprised of key general points with headings below, explained in detail in sections 1-7 followed by our response to your terms of reference in sections AB & C.

The general points are covered under the following headings below:-

Growth of rail freight and its importance to UK PLC

Infrastructure Commission should make using rail a planning condition

Road and rail complement each other as part of the logistics solution

Rail's role in delivering to cities and transhipping to last mile low emissions deliveries

Land use planning

Lack of a level playing field between modes

Upgrading key rail routes can significantly reduce road congestion on key strategic corridors

1. The growth of rail freight and its importance to UK PLC

Both the Secretary of State for Transport, Patrick McLoughlin and the Rail Minister Claire Perry have voiced their support for rail freight. In June 2015 Claire Perry commented on *'the*

remarkable rise of rail freight' at the Rail Engineers Forum conference in June 2015. She highlighted rail freight's excellent record to date and its forecasted growth in two key market sectors saying that the Government wants to work with the rail freight industry to remove barriers that inhibit that growth.

On December 9th 2015, the Secretary of State endorsed her statement saying "*that the story of our modern rail industry is amazing and freight is a key part of that. We want rail freight to grow much further because demand to going to keep increasing*".

Consumer traffic has grown by 30% since 2006/7 and grew 5% in the last full year14/15.

Construction traffic increased by 17% in 2013/14 and 10% last year with 2.5 per annum growth forecasted. The decline of coal traffic has been largely anticipated and forecast although the scale of the decline was sharper than expected; coal traffic was down 61% in the first quarter of 2015/16. So the Government and devolved bodies need to work together with the industry to provide a network which can cater for more consumer rail traffic and construction traffic, both forecast to expand, to replace the coal traffic.

Industry Forecasts show intermodal rail traffic will quadruple by 2034

Consumer rail traffic is forecast to quadruple by 2034. Construction traffic 2.5% annum growth forecasted. But forecast are dependent on upgraded network and existing market conditions.

Retention of the mode shift benefit grants are important to overcome the lack of a level playing field between HGVs and rail. See section 6

2. **Infrastructure Commission should make using rail a planning condition** during construction phase of infrastructure projects for the delivery of raw materials and removal of spoil because of its lower external costs than road freight. The nearest railhead should be used whether building roads, rail, power stations or airports, using nearest railhead. The Olympics, Crossrail and Terminal 5 are good case studies of demonstrating the benefits of this approach.
3. **Road and rail complement each other as part of a logistics solution** by each playing to its strengths. As well as its bulk commodity markets, rail is well placed to offer the long-distance

trunk haulage for consumer traffic, as demonstrated its 30% growth since 2006/7 and its sustained 33% market share for the past few years, including in 2014/15.

4. Rail's role in delivering to cities and transhipping to last mile low emissions deliveries

A growing number of cities in the UK need to reduce air pollution to comply with EU regulations as seen by the Supreme Court ruling on London's air pollution violations. By 2020 Leeds will not be compliant with EU NOX regulations. Rail has far lower NOX emissions and lower particulates which are the key air quality problems. Two separate Colas Rail trials with TNT and Stobarts into Euston have proved that specialist freight trains can come into the heart of cities where the cargo can then be discharged into low emissions vehicles. Similarly, if rail connected consolidation centres are set up on the edge of conurbations rail can be part of the logistics solution by transporting the goods long-distance and then transhipped to low emissions vehicles for final urban deliveries.

5. Land use planning

We believe the NIC needs to be cognizant of the importance of land use spatial planning in delivering national infrastructure. Without coherent and integrated spatial and transport planning, the NIC, TfL and TfN will find it difficult to deliver the required rail upgrades. TfN can set the overall spatial planning framework for the North and direct local authorities to safeguard suitable sites and rail alignments for potential rail use in their Local Development Frameworks. For rail freight, it is crucial that local and regional authorities protect suitable sites for terminals for future potential use because there are a limited number of suitable locations which have the necessary rail and road connections. The Government's National Network National Planning Policy which includes the Strategic Rail Freight Interchange policy would support applications for SRFIs nationally significant infrastructure projects in the planning system.

6. Lack of a level playing field between modes

All levels of Government must take into account the scale of subsidy given to HGVs and the level

of external costs unpaid by the sector in their transport planning; HGVs impose almost ten times more external costs on the economy and society than rail freight. The latest research carried out for the Campaign for Better Transportⁱ using DfT values, found that HGVs pay less than a third of their costs, such as road congestion, road collisions, road damage and pollution which equate to an annual subsidy of around £6.5 billion. These conclusions are in line with a MDS Transmodal study in 2007 which found a very similar amount of underpayment: £6billion. The Government needs to recognise HGV costs in discussion about rail freight costs so that policy implications can then be understood in both directions with road and rail being examined across the piece. The level of HGV subsidy makes a compelling case for supporting rail, which imposes much lower costs on society and the economy, equivalently.

7. Upgrading key rail routes can significantly reduce road congestion on key strategic corridors

Research commissioned by CBT looked at specific routes which typically tend to be more congested because of more long-distance HGV traffic, particularly to ports. Its key findings were that:

- a) Some parts of road network have more long distance HGV traffic which could be carried by rail
- b) The impact of additional traffic in already congested conditions is far greater than a simple increase in pcu or vehicle kilometres suggest – it rises exponentially.
- c) In congested conditions each single per cent increase in traffic causes several percentage increase in congestion. In fact, Department for Transport figures state that a modest decrease in traffic of around 2%, results in congestion falling by 10%. DfT figures show that on congested parts of the network, congestion could be three to four times the percentage reduction in overall traffic levels, using a simple low congestion impact multiplier of 3-4.

The research found that in key corridors, such as the Trans- Pennine, London to East Midlands, Felixstowe to the North, Southampton to the North, Yorkshire and NE including M1 and A1, which all suffer severe congestion at peak hours the transfer of freight to rail could be significantly alleviate road congestion by removing HGVs.

<http://www.bettertransport.org.uk/sites/default/files/research-files/Freight%20mode%20switch%20report%20d6.pdf>

Importance and strength of rail freight as part of the logistics solution.

- Rail freight generates more than £1.6bn a year in economic benefits for UK PLC through improved productivity, reduced congestion and wider environmental benefits.
- Rail freight transports goods worth over £30bn a year, ranging from high end whiskies and luxury cars to supermarket products, cement and coal. Rail moves one in four of the containers entering the UK and half of the fuel used in electricity generation.
- The Hendy Review, which was tasked with reviewing the status of the Network Rail enhancement projects, acknowledged rail freight schemes deliver very high value for money. It stated that the average benefit cost ratio for rail freight schemes is between 4 to 5ⁱⁱ, which demonstrates that rail freight upgrades offer significant socio-economic benefits to the UK. Targeted infrastructure interventions work; the gauge enhancements out of the port of Southampton resulted in rail's market share increasing from 28 to 36% within a year of the completion of the work.
- **Terminals help regenerate local economies**
Local and regional authorities and LEPS therefore need to take into account the fact that rail freight terminals bring local re-generation benefits. Strategic rail freight interchanges (SRFI) can employ large numbers of staff directly. Daventry SRFI now employs around 5000 staff which will rise to 9000 when current expansion is finished. There is scope for terminals of all sizes which need new road/rail works.
For example, LEPS could help fund new roads to SRFIs and rail connections to the network for terminals through the Local Growth Funds.
- Rail freight industry has invested over £2bn since the mid 1990s

Rail freight's socio-economic benefits to society and the economy

- Rail freight is safer than road freight, HGVs are more than 6 times likely to be involved in fatal accidents than cars on local roads. *Source: Traffic statistics table TRA0104, Accident statistics Table RAS 30017, both DfT*
- Transfer to rail can reduce road maintenance costs as HGVs have an adverse impact on road infrastructure. The heavier HGVs are 160,000 times more damaging to roads than the average car- Source 4th Power law. This was shown by the high HGV charge for the M6 toll road, a private venture.
- Congestion benefits of rail freight - road congestion is now costing around £24 billion per annum according to the Freight Transport Association; the heaviest freight train can remove a 160 long distance HGVs from our roads – *Source Network Rail June 2010 Value of Freight.*
- UK rail freight produces 70% less Carbon dioxide emissions than the equivalent road journey- *Source DfT Logistics Perspective Dec 2008 P8 section 10*
- Energy efficiency of rail
A gallon of diesel will carry a tonne of freight 246 miles by rail as opposed to 88 miles by road – *Source Network Rail July 2010*
- Rail freight produces almost 90% less PM10 emissions than road freight and up to fifteen times less NOx emissions – DfT Logistics Perspective Dec 2008 P8 paragraph 10
- Damage and costs of main pollutants from transport
Road transport is the source of 80% of NOx in problem areas which rail can help reduceⁱⁱⁱ.

B.London's Transport Infrastructure

Protection of freight paths on the North London Line (NLL) and West London line (WLL)

These paths are vital to rail freight services irrespective of any extra capacity coming on stream out of the port of Felixstowe as they are needed for the following

- i) Two thirds of rail freight traffic has a London destination and that freight paths are not during rush hours.
- ii) The vast majority of London Gateway traffic will need to use the NLL.

iii) London Gospel Oak Barking electrification should include freight links to WCML and London Gateway.

There should be protection of potential and existing rail freight terminal sites beside railway lines with good road links for terminals of all sizes. As there is for riverside wharves which are protected through a GLA act. Rail sites should get the same protection as wharves. In the past, there was the SPG land for industry and transport.

Need both Strategic Rail Freight Interchanges for consumer products and more terminals for aggregates and other bulk products.

iv) Consolidation centres should be rail connected, as rail is well placed for long distance consumer traffic as well as traditional bulk commodities, to compete with road which would also have transshipment costs into smaller low emissions vehicles for example.

e) Channel Tunnel services into London were growing especially since the HS1 access to Barking Terminal and the reduction in CT charges but severely damaged by security issues at the CT.

C. Delivering future-proof energy infrastructure

Make using rail a planning condition for transportation, where practical, to reduce adverse impacts. Rail is currently used in the biomass and nuclear industry.

FTA Submission: National Infrastructure Commission call for evidence - London

January 2016

About FTA

The Freight Transport Association is one of the UK's largest trade associations and represents over 14,000 members relying on or providing the transport of freight both domestically and internationally, to or from the UK. Our members include hauliers, freight forwarders, rail and air freight operators, through to customers – producers, manufacturers, wholesalers and retailers. They cover all modes of transport – road, rail, air and sea. FTA members operate over 200,000 commercial goods vehicles on the roads in the UK; which is more than half of the UK fleet of goods vehicles. FTA members also consign around 90 per cent of goods moved by rail and around 70 per cent of goods moved by air and sea.

Introduction – UK infrastructure and logistics

FTA is pleased to be responding to this call for evidence. Infrastructure development in the UK has for too long been focused too much on the short term, stop start in its funding and has failed to adequately address national/regional needs in the face of local considerations. This has particular implications for freight as logistics is an inherently pan-national activity.

The efficient movement of goods is crucial to our society. Sometimes it is hard to remember the full scope of what is freight. At one end it is the heavy bulk movements like the construction material that makes our buildings and the waste that is taken away from our cities every day. At the other end, the book that is delivered to your house is also freight. Every cup of coffee you buy in a café is freight. Every piece of food on the shelves is freight. Every package of documents delivered to an office is freight. Every component or raw material used to supply a workshop is freight.

Without logistics society would grind to a halt overnight. In practical terms, everything that makes logistics less efficient adds to the cost of living and of doing business in the UK – everything that removes inefficiencies aids our development.

This is true of social objectives as it is of economic efficiency. More efficient logistics (through optimising mode used and ensuring free flowing movements) would help address emissions and safety issues – priority issues for FTA's members.

We look forward to working with the National Infrastructure Commission to help address the UK's needs as regards transport networks.

In the rest of this document, FTA will respond to the challenges identified and questions asked where they are relevant to our area of interest.

Response to Call for Evidence: London's transport infrastructure

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London's population is expected to reach over 10 million people by 2030. This will increase demand for both personal travel for commuting and leisure purposes and also increase demand for deliveries and servicing activity. Due to the nature of the operations (ie final delivery to the customers' door) the vast majority of urban deliveries will always be made by road – therefore meeting the freight needs of the increased number of residents and increased economic activity in London will be a major challenge. Decisions will have to be made about the most efficient use of limited road space.

Transport for London estimates that central London congestion will grow by 60% by 2031. FTA believes that action needs to be taken now to secure the long-term sustainability of London if it is to maximise its competitiveness and attractiveness as a world city.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?
- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

Future investment in large-scale infrastructure improvements should not just be aimed at solving current pinch-points, but also unlocking new areas for development. All too often, the transport infrastructure to support new development is an afterthought, and the true economic potential is not realized due to poor connectivity. East London is the prime example of a growth area with poor transport links, particularly cross-river road connectivity. However, Transport for London is now seeking to redress this with plans for a network of new road river crossings in East London – these plans must be fulfilled

Investment in public transport and alternatives to driving, to remove the reliance on private cars, is key to reducing congestion - freeing up space for essential or efficient traffic such as freight, tradespeople, pedestrians, cyclists, and disabled drivers.

However, investment in the core, motor-traffic oriented, road network should not be excluded and it is important to consider how various schemes interact with one another. It is essential that we achieve a sensible balance between the needs of different transport users so that we make best use of limited road space to benefit London overall.

For the freight industry, journey times are important, but arguably what is even more important is journey time reliability. If journey times significantly increase or there is a poor level of certainty about journey times which could result in reduced productivity per shift, due to the constraints of EU drivers hours rules, we will see transport operators having to put more HGVs on the capital's roads leading to increased transport costs, congestion and emissions.

London needs increased road capacity in key areas – river crossing in east London being the first example, but across London improved roads will be needed. There are social impacts from increased road use – ie emissions and safety. FTA believes that in the timeframes we are talking about here these should be addressed through improved vehicle technology – not through restricting the improvement of infrastructure at key pinch points and congested areas.

If the logistics industry is to successfully serve the needs of London's increased population and consequently increased business activity, it will require a more efficient road network than currently exists. In the case of freight more infrastructure will not exponentially increase traffic as our industry only moves the quantity of goods that society requires of us.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?
- What innovative funding mechanisms could be considered to support delivery of key schemes?

All funding options should be considered. However, we need to be careful of private ownership of key infrastructure – the Severn Crossing on the M4 is a prime example of where such a move can lead to high user charges long after the capital costs have been recouped. FTA accepts that user charges may need to be introduced to both fund new infrastructure and to manage demand. However, any demand management measures implemented on new schemes should be focused on those who have alternatives (such as private car drivers) rather than essential delivery vehicles which have little alternative option but to use the capital's road network. This is to ensure that there is an appropriate deterrent effect on those who in the main have an alternative choice – to use public transport – and to avoid additional cost to essential deliveries and servicing activity which has limited modal shift opportunities in the capital.

15th January 2016 (by arrangement with the NIC)

Thank you for the opportunity to comment in the call for evidence:

<https://www.gov.uk/government/consultations/national-infrastructure-commission-call-for-evidence/national-infrastructure-commission-call-for-evidence>

We wish to make some points in relation to section 3 on London's transport infrastructure.

We include as Annex 1, and refer you to, our submission to the London Assembly Regeneration Committee inquiry into Transport-led regeneration.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Economic and social challenges which face London must be considered and dealt with together with environmental challenges, according to the principles of Sustainable Development which underpins planning and of which a definition is set out in the NPPF, and also in the London Plan

<https://www.london.gov.uk/what-we-do/planning/london-plan/current-london-plan/london-plan-annexes> .

This means that solutions to London's economic, social and environmental challenges must be ones which are win, win, win for all 3 areas – as the government says “We want to achieve our goals of living within environmental limits and a just society, and we will do it by means of a sustainable economy, good governance, and sound science.” <https://www.gov.uk/government/publications/securing-the-future-delivering-uk-sustainable-development-strategy>

Indeed the key challenges facing London are ones which are economic, social and environmental in nature.

Population growth is a key challenge for London in all these 3 respects – including on transport implications. Anticipated population growth should be dealt with sustainably as part of a national strategic strategy, however some inevitable increases in London must be dealt with sustainably from a transport point of view. Population growth will result in potential extra journeys, and so pressure on existing infrastructure and demand for further investment.

Dealt with in the wrong way and this could have negative implications on the economy such as, if traffic was allowed to increase, through worsened congestion. There could also be negative social implications from more traffic including more accidents, worse community severance, and such as health impacts and worse health inequality from the environmental problem of worse air pollution (as the most disadvantaged tend to live near main roads where air pollution is worst worse air pollution exacerbates health inequalities).

However there is an existing problem and challenge of there being too much dirty traffic in London - current and expected worse congestion, and current inequalities including health inequalities are themselves key challenges for London.

Air pollution is an environmental challenge but also an economic and social one. Economically there are costs estimated at up to £20B a year, congestion and air pollution kept London down to 38th place for liveability in a ranking of world cities (<http://www.telegraph.co.uk/expat/expatnews/10648488/Viennas-the-most-liveable-city-but-polluted-London-misses-out.html>), and this would be expected to have impacts on the economy as businesses want an efficient as well as a healthy environment for people to live and work in and to visit. Socially nearly 10,000 Londoners die prematurely a year due to air pollution, with the most vulnerable in society being disproportionately affected – and with the early deaths being just the tip of the iceberg below which there is ill-health.

The NIC will be aware that the UK is failing EU legal limits for the toxic gas Nitrogen Dioxide (NO₂) which were due to be met by 2010, and 2015 at the very latest. It will also be aware that a Supreme Court ruling has meant that the government was required to produce new plans by the end of last year to meet limits now in the shortest time possible, but that these plans have been deemed by those who brought the case to be not adequate (failing as they do to take all possible measures).

The EU Air Quality Directive's requirements are absolute, and that there can be no averaging of improvements and deteriorations across a zone. Not only is there a non-deterioration principle to protect relatively good air under limits, and the requirement that a breach not be caused, but also that air over limits must not be worsened.

It is not adequate to rely for compliance with EU law on whether a scheme would delay compliance for the Zone ie if there would be elsewhere in the zone with worse air, as has been argued by some based on the NN NPS – but following that cannot render the UK in breach of its international obligations such as the EU Ambient Air Quality Directive. This issue was referred to in the McCracken opinion obtained by Clean Air in London:http://cleanair.london/legal/clean-air-in-london-obtains-qc-opinion-on-air-quality-law-including-atheathrow/attachment/cal-322-robert-mccracken-qc-opinion-for-cal_air-quality-directive-and-planning_signed-061015/.

The London Plan requires development to be Air Quality Neutral (as at 7.14c) ie for air pollution not to be worsened. However, given the requirement to meet limits in the shortest time possible AQ Neutral is no longer an adequate criteria at this time. Measures proposed to mitigate the effects of a scheme must be done anyway, but the scheme itself not allowed to add to the problem ie the scheme not pursued. Only then, with all other possible positive measures and avoidance of negative ones, would illegal air pollution be brought within limits in the shortest time possible.

There are particular air pollution challenges with the gap between emissions of NO_x expected due to lab tests not being matched in real world driving emissions. The EU Council of Ministers agreed on 28th October 2015 on standards for EU Real Driving Emissions (RDE). The agreement was reached in order to address the discrepancy in emissions between laboratory tests and NO_x emissions found in real world driving. However the new standards would allow new types of Euro 6 diesel cars to emit more than double the Euro 6 NO_x emissions limit from 2017 to 2020, and 50% more after 2020, thereby de facto increasing the standard of Euro 6 from 80mg/km to 120 mg/km (http://europa.eu/rapid/press-release_IP-15-5945_en.htm). There is also the challenge of the VW and wider scandal to be taken into account.

The need to address the causes of climate change are also a huge challenge for London's infrastructure – on transport (and on which measures to tackle air pollution largely overlap with those to tackle climate), and also in buildings and housing (particularly in retrofitting existing stock, and in new build), and on energy supply infrastructure.

Also the impacts of climate change are another environmental challenge which will lead to huge social and economic challenges too – for instance heatwaves and the need to cool the tube, drought and our water supplies, more intense rainfall and the need to slow water's progress into drains are all huge challenges for London's infrastructure. The Mayor and London Assembly have done considerable work on this.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

The only strategic options are those which deliver on sustainable development in London ie those which help not hinder our ability to live within our environmental limits, and to build a just society ie options which are win, win, win for the economy, society and the environment.

As well as ensuring what vehicles are on our roads are clean, traffic levels must be cut.

No schemes which would add to traffic can be pursued, and only schemes which give people alternatives and help them out of vehicles can be pursued – and this is all the more so the more population is expected to increase.

Road space can and must be restricted and can be re-allocated to help deliver a step change in cycling and walking infrastructure to maximise the potential for these modes, and for public transport to address identified need for longer journeys.

- **How should they be prioritised, taking account of their response to London’s strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**

The absolute priority is to progress only what will help deliver on environmental issues such as air pollution and climate change, as well as social issues including inequality, at the same time as developing our economy.

The first priority must be to plan to reduce the need for people to have to travel at all unnecessarily – by providing key amenities and work opportunities within easy walking and cycling distance of homes as much as possible. This is particularly important for any regeneration areas and where population or jobs are due to increase. This approach will help reduce pressure on existing infrastructure, and in turn the demand for further investment.

Facilities for safe and easy walking and cycling must be prioritised to maximise the potential for these modes, which are considerable – ahead of pursuing any identified need for new public transport to adequately enable longer journeys.

There is no place for adding to traffic levels – indeed all road users are helped by cutting traffic levels and less traffic helps congestion, resilience and journey times. Vehicle users are in fact helped by less traffic as this frees up existing roadspace for existing and some future new essential vehicle trips.

In East London a package of non-road measures including new non-road river crossings must be developed– the current road-building plans would add to traffic and so to congestion in the wider area (even if queuing at the existing Blackwall tunnel was reduced there would be worse congestion overall and at other places), and the plans would worsen air pollution.

Further infrastructure must not be allowed at City Airport – this is currently seeking a taxiway and new aircraft stands. City airport is a blight on East London with the aircraft noise, air pollution impacts, and the Public Safety Zone (PSZ) blights large areas around the runway itself. There would be multiple benefits from closing the airport (now that Crossrail will allow quick access to Heathrow) and freeing up the land for much needed housing and work and amenity uses

<http://www.neweconomics.org/blog/entry/why-its-time-to-close-london-city-airport>

- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Crossrail 2 (any more than Crossrail before it) must not be allowed to develop at the cost of other small scale local transport improvements.

Also, if these mega projects are being pursued, it is essential that the benefits of the investment are maximised by investing in complementary transport measures to feed people into and out of the mega scheme eg walking and cycling connections, and also other public transport, so that the benefit reach out to as wide an area as possible.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

London-wide road user charging or pay-as-you-go driving must be seriously looked at for London –the Congestion Charge Zone in central London has been very successful in keeping traffic out, and a scheme is needed to cover the whole of London in order to cut traffic and congestion (and help with air pollution), and this can be a revenue earner to be used to give alternatives to driving.

- **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

There are examples of how removing road space from vehicles has been done and been successful. For instance Seoul removed a key highway from its centre:

(<http://www.theguardian.com/environment/2006/nov/01/society.travelsenvironmentalimpact>)

Cities are now increasingly restricting road-space and traffic to tackle air pollution:

<http://www.theguardian.com/cities/2015/dec/09/car-free-city-oslo-helsinki-copenhagen>

(Oslo [revealed plans](#) to ban all private vehicles from the centre by 2019)

ANNEX 1 – Friends of the Earth submission to the London Assembly Regeneration Committee inquiry into Transport-led regeneration, August 2015 (also in the collated submissions for the inquiry <https://www.london.gov.uk/about-us/london-assembly/london-assembly-publications/transport-led-regeneration>)

31st August 2015

Re Inquiry: Transport-led regeneration

Thank you for the opportunity to comment on this important issue. We trust that, given that it was until the end of the month that responses to the inquiry were welcomed (see email chain below), you will accept our comments dated 31st August.

We wish to make the following brief comments, with reference to the Thames Gateway road bridge as a case study of ill-conceived transport-led regeneration.

We understand that Campaign for Better Transport will have made a submission referencing a report of theirs.

We wish to follow that up stating that it is our view that it is regeneration led by sustainable transport modes which is clearly the way to develop London sustainably in a way which helps address inequalities and helps us meet our environmental targets, and that road-building-led regeneration is not only counter-productive but also iniquitous.

Focusing on regeneration models which help improving accessibility through reducing the need for people to have to travel, by providing as much as possible, key amenities and work opportunities within easy walking and cycling distances not only enhances quality of life and health, but also takes the pressure off public transport.

Investing in public transport for any identified need to facilitate longer journeys helps all road users. It helps those without access to a vehicle and reliant on public transport, and also helps take the pressure off the road network – the aim should be that the road network should be left for essential vehicle journeys (both existing and potential new ones as a result of population growth).

By contrast investing in road-based regeneration tends to mean fewer people travel by sustainable modes (as people are attracted by driving), which is not only contrary to policy and also deprives people of the health benefits of active travel.

Non-road based regeneration makes much better use of space, enabling higher densities and more land available for housing and work opportunities, or public/open space – as providing space for roads and parking space is wasteful. The main businesses which tend to be attracted to an area when road-based regeneration is pursued would be vehicle-dependent development such as warehousing and distribution which tends to be low-density and low-employment usage.

Indeed, the evidence for road-based regeneration is very weak and potentially counter-productive.

The Greenwich Peninsula site should have been a prime development site, if its position next to the 4-lane

Blackwall road Tunnel was truly beneficial – yet the site lay dormant for a long time until British Gas paid English Partnerships £20m (as I recall) to secure a Jubilee Line Extension station on the site.

Further the proposed Thames Gateway road bridge (TGB) proposed between Greenwich and Newham, on proper scrutiny at a Public Inquiry in 2005-6, showed that the regeneration claims made for the scheme did not stand up.

Further, given the requirement in planning for sustainable development, whereby economic development, the building of a just society and the requirement to live within our environmental limits are required to be delivered together (ie through win, win, win solutions) it is clear that transport investment must be such that helps reduce inequalities (including health inequalities), and help deliver on environmental targets such as on climate change and air pollution – and that the pursuit of economic goals does not add to the problems of meeting either social and environmental goals.

Whereas non-road based regeneration helps deliver sustainable development, road-based regeneration adds to traffic levels (through generated traffic – whether overall or at certain times of day), and so worsens congestion in the area (though the pattern of existing congestion may change), and adds to air pollution.

More traffic and worse congestion and more air pollution blights and is clearly de-generation for local communities. Air pollution is an issue which hits the most vulnerable, and the most deprived the hardest (as they tend to live near the main roads where air pollution is worst) – and so adding to air pollution adds to health inequalities.

But worse traffic, congestion and air pollution is also bad for business and for regeneration – adding to congestion is clearly counter-productive, and air pollution makes an area unattractive for people to live or work or visit.

We wish to draw your attention to a few key links:

Case study: the Thames Gateway road bridge:

This press release and linked briefing refers to various issues raised by the planned TGB – on traffic generation and congestion, on air pollution, and on fewer people walking and cycling and using public transport if the scheme went ahead, and on regeneration.

Friends of the Earth's 2007 briefing from after the end of the TGB inquiry but before it was known the Inspector had recommended rejecting it

http://www.foe.co.uk/resource/press_releases/thames_gateway_road_bridge_06112008

Background briefing at the end of the Public Inquiry:

http://www.foe.co.uk/sites/default/files/downloads/thames_gateway_bridge_07.pdf

On traffic and congestion:

- Induced traffic: Professor Phil Goodwin

<http://stopcityairportmasterplan.tumblr.com/post/19513243412/induced-traffic-again-and-again-and-again>

- Transport expert John Elliott's slides showing when Blackwall tunnel was doubled from 2 to 4 lanes, traffic more than doubled within a year at peak time

<http://stopcityairportmasterplan.tumblr.com/post/20012814230/presentation-slides-arguing-the-case-against-the>

- John Elliott also has made clear that with more roadspace, more traffic would mean overall worse congestion in the area (though the pattern of congestion may change).

If congestion was relieved eg at the Blackwall tunnel/Silvertown Link approach then it would just mean that traffic had got on to another area quicker and making congestion worse there.

- The TGB Inspector's report stated that crossing was "likely to cause increased congestion"

http://www.foe.co.uk/resource/press_releases/thames_gateway_road_bridge_06112008

- A Hyder report which was buried by Greenwich warned of "The likely outcome would be the exhaustion of the Silvertown Link capacity within a relatively short timeframe with exacerbated congestion on the local road network." and "This could only be mitigated by a new high quality public transport link, such as a DLR extension."
<http://853blog.com/2014/05/06/buried-greenwich-council-report-criticises-silvertown-tunnel/>

Road building and air pollution:

- For example the TGB would have resulted in worse air pollution (see above)
- Kings college London did a study of widening the A206 (which was a key link to make a route all the way from the TGB to the M25 dual)

<http://www.sciencedirect.com/science/article/pii/S0048969714010900>

This showed:

- Local air quality deteriorated after completion of a road widening scheme in south London.
- The EU PM10 limit value (LV) was breached during construction.
- NO2 LV was breached after scheme due to increased cars, taxis and LGVs

Despite this evidence, TfL have continued to pursue new road-building and argued that it would help regeneration.

What they have not done is look at a proper package of non-road alternatives, which would include multiple non-road investments as well as road-pricing etc as required.

GB Railfreight – Response to the National Infrastructure Commission

London Transport Infrastructure Review

Q. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Rail freight plays a vital role in bringing aggregates and other construction materials to London for major civil engineering and construction projects, as well as removing waste in the form of spoil. For Crossrail, GB Railfreight has transported over 1 million tonnes of excavated material from the tunnels to a new nature reserve at Wallasea Island in Essex.

In order to sustain growth across these markets, and continue supporting UK manufacturing and construction, it is vital that London possesses strategically effective rail connectivity and freight facilities. As such, we are going to detail areas that we believe need to be considered in the National Infrastructure Commission's Review.

a. Inland rail freight terminals

i. Aggregates terminals

In the Greater London Authority's Local Aggregate Assessment for London 2013, it was concluded that, with two years left to run on the Capital's landbank of permitted aggregate reserves, rail heads would be crucial in sustaining high levels of imports into London.

GB Railfreight supports the development of existing and new strategically effective aggregates terminals across London, which are truly open access for the rail freight industry, in order to deal with actual and prospective growing demand.

The key to adjusting to demand and not wasting spend on the wrong developments is focusing on sites that have economies to support them, as well as incorporating aggregates needs in plans for station rebuilds and enhancements (e.g. Euston station), and major programmes such as HS2.

Despite being intermodal terminals, both Stratford and Willesden freight terminals are prime examples of speculative builds subsequently closed, that suffered significant losses because, along with delay risks and road congestion costs, they had a limited market to drive business.

On the other hand, if we assess Hanson UK's Kings Cross Concrete facility, it has been able to grow into the second largest concrete site in the UK as a result of its strategic location. This growth has been supported by infrastructure at the facility, which allows it to accept large trains and offer significant storage space, as well as high levels of operational competitiveness.

It is also important to note that central and local government's commitment to selling off public land reduces scope for potential aggregates sites in London and, as a result, the Chancellor's 160,000 homes target.

GB Railfreight recommends that an evaluation is made of the markets across the Capital that require support, or further support, from an aggregates rail freight terminal.

ii. Cricklewood

Cricklewood represents the last location in London that is ideally connected for both road and rail freight. Companies operating there primarily carry out spoil and refuse haulage. In September last year, GBRf ran its first train for FCC Environment, transporting waste from its new North London Railfreight Terminal in Cricklewood to Buckinghamshire.

As the Capital continues to build, and major projects and programmes such as Crossrail and HS2 progress, more and more construction soils and materials need to be able to leave the capital efficiently and with the least cost to the environment. This comes at a time when London's roads are already seriously under strain. Cricklewood will, therefore, be crucial in helping remove lorries from London's roads.

The planned Brent Cross Thameslink railway station, as part of the Brent Cross Cricklewood development, will see various freight sites being moved from one side of the Midland Main Line to the other. Our concern is that could lead to the reduction in available land for freight, so we would like to see various sites safeguarded for freight prior to the move.

GB Railfreight recommends that freight sites at Cricklewood are safeguarded.
--

b. Freight route investment

In order to support proposals around inland freight terminals and freight capacity in London, we need to address the problems of bottlenecks on key lines in and out of the Capital. These bottlenecks often occur on sections of two-track with flat junctions, such as on the North London Line, West London Line and South London Line.

The North London Line provides a nationally important and electrified freight route from the UK's largest ports, at Felixstowe and London Gateway. In order to cater for the planned growth of freight and passengers, and to do so robustly over the next 20-25 years, the North London Line needs additional signalling throughout and a new regulating point near Gospel Oak or Kensal Rise. Reduced planning headways (with additional signalling) are also needed between Gospel Oak and Barking.

Further capacity problems exist on the Midland Main Line north of St Pancras, which has been designated as congested infrastructure by Network Rail. The Line cannot cater for current demand, let alone future passenger and freight growth. As such, timetabling is crucial to limit delay. However, with the second stage of Thameslink opening in 2019, this will become even more difficult.

The investments made by the Strategic Freight Network fund, and work carried out by Network Rail to incentivise passenger growth, have increased the separation of freight and passenger services. Following West Anglia Route Modernisation and enhancements to the Great Northern Great Eastern line, there will be the potential to run freight and passenger operations from London to Doncaster in almost total separation. More opportunities to separate the traffics brings benefits to both modes of freight and passenger, whilst crucially retaining the ability to use both routes for contingency and maintenance provision.

GB Railfreight recommends that opportunities are evaluated for improving infrastructure capacity on the North London Line, South London Line and Midland Main Line.

National Infrastructure Commission
Response the call for evidence on London
Gravesham Borough Council Response

Introduction

Gravesham Borough is located in Kent south of the river Thames, east of the Dartford Crossing and has a population of 105,300. The main Gravesend/Northfleet urban area has a population of 84,400. The rest of the Borough is covered by Green Belt, though within that there are significant areas of Ramsar/Special Protection Area (North Kent Marshes) and parts of the North Downs Area of Outstanding Natural Beauty.

On the west side of the Borough north of the A2 is the Ebbsfleet Valley, shared with Dartford Borough Council, and now covered by the Ebbsfleet Development Corporation. The two Boroughs' remain the plan making authorities. Considerable development has been proposed and consented in the Ebbsfleet area, and is now starting to happen on the ground. The EDC is charged with accelerating and developing the vision for the 'Garden City'.

The Borough is crossed west-east by the A2 trunk road (4 lanes plus hard shoulders) connecting London and the M25 with North Kent and Dover. The M20, just to the south of the Borough, is the main route to the Channel Tunnel and ferry's. Both connect to the M25 which provides links round London and to the rest of the country.

There are three railway lines across the Borough, all running roughly east - west. The North Kent Line links London Charing Cross & Cannon Street with Medway Towns via Dartford & Gravesend. HS1 links London St Pancras with the Channel Tunnel with an international and domestic station in the Ebbsfleet. Domestic Services operate over HS1 from East Kent via Ashford and via Gravesend. Finally there is the Chatham line running through the rural area linking London Victoria with the Medway Towns and East Kent (east of Medway this is confusingly also referred to as the North Kent line). Travel times currently to central London are in the order of 60 minutes from Gravesend by the traditional routes and 24 minutes on HS1.

27% of the working population are employed in Greater London and commute by coach, rail & drive, and only 33% work within the Borough. 18% of journeys to work are by public transport and 65% are by car.

The Borough therefore qualifies as part of the 'London commuter hinterland' and there is a tension between a role (at one extreme) of being a pure commuter settlement and providing more employment in the Borough to produce more sustainable travel patterns.

The north of the Borough is part of Thames Gateway with significant redevelopment opportunities on former industrial land. Land values, compared with London, are relatively low so there are viability issues.

Question 1 Economic and Social challenges

Gravesham has an adopted Local Plan Core Strategy to 2028¹. Work for Kent County Council extrapolates this to 2031². The Council has commissioned technical work for the Local Plan including a SHENA (Strategic Housing and Economic Needs Assessment) which will update the objectively assessed housing need, employment and retail requirements and

¹ Gravesham Local Plan Core Strategy <http://www.gravesham.gov.uk/services/environment-and-planning/planning/planning-policy/gravesham-local-plan-core-strategy>

² KCC Infrastructure plan <http://www.kent.gov.uk/about-the-council/strategies-and-policies/environment-waste-and-planning-policies/growth-and-infrastructure-framework-gif>

look further into the future. This includes analysis of development land values and site viability. This study will be subject to consultation in the spring, but is likely to show, in line with the national household projections, higher levels of housing need. As a rule of thumb the latest national household projections suggest something in the order of a 25% increase in annual housing completions for Kent as a whole over and above levels set out in the South East Plan (as an arbitrary benchmark). This represents a major transport challenge for an already stretched transport infrastructure across the South East.

The Borough has a finite supply of brownfield sites, and once these are developed it will be necessary to hold discussions within the sub-region about the scale and location of development. This will include the role of the Metropolitan Green Belt and its boundaries. As noted above there are nature conservation and landscape constraints in the rural area. The Borough is the least self-contained in employment terms in Kent and there is an objective to increase local employment for sustainability reasons.

A major component of new development is in the Ebbsfleet area around the International and Domestic Station, shared with Dartford Borough. The overall strategy stems from the mid 1990's and the arrival of HS1, and required a significant modal shift. Planning permissions exist for the most of the overall area. The Ebbsfleet Development Corporation (EDC)³ is now taking this area forward and has commissioned a masterplan. It has £310 m to assist with infrastructure delivery over the next 5 years.

London Resort Company Holdings (LRCH) is proposing a leisure resort on Swanscombe Peninsula mainly in Dartford Borough, which is aimed at attracting 15m visitor a year and directly employing some 13,000.⁴ LRCH are continuing to develop their proposals and assess the impacts, but they are of major significance in creating demand for travel by both workers (13,000 jobs directly) and visitors (up to 96,000 per day at peak). It is currently intended to progress the development via an application under the NSIP process.

The EDC masterplan will deal with both a 'with and without' London Paramount world. Various sites have recently been granted Enterprise Zone status in the Ebbsfleet and at Northfleet Embankment. The new development needs to be grafted and integrated with the existing communities, complicated physically by the changes in levels brought about by the chalk quarrying of the past.

It has been known since the original work on Kent Thameside in the mid 1990's that given the local road infrastructure (and reasonable enhancements thereto) that a major shift to public transport was required to cope with travel demand along with additional local jobs. The HS1 station at Ebbsfleet was a key part of the strategy along with the Fastrack system. The later along with local bus routes, walking and cycling networks is the foundation on which rail sits.

The intention was to create a substantial amount of local employment to attract employees, especially from further east, and increase local self-containment. In Gravesham the housing market already includes a component of movement out of London and on further east, so commuting will remain a significant element.

A2 is highly congested and proposals are being developed junction enhancements to support development at Bean and Ebbsfleet. Proposals exist for additional crossing capacity either at the existing Dartford Crossing or east of Gravesend. A fresh consultation is about to occur on this contentious issue. The Borough Council opposes routes east of Gravesend on environmental grounds.

Both residents and businesses see transport as a key issue, as witnessed by reposes to recent consultations by EDC and LRCH. There is scepticism over the ability of the transport

³ Ebbsfleet Development Corporation <http://www.ebbsfleetdc.org.uk/masterplanning/>

⁴ LRCH <http://www.londonparamount.info/have-your-say/project-documents/>

system to handle new development and concern over the reliability of the system, especially by business.

Thus there are major transport issues locally, never mind the outworking of some of the considerations outlined for example in the London Infrastructure Plan 2050⁵.

It is important that a focus on major infrastructure projects does not exclude considerations of ease of use – covering such matters as information, paying tolls and fares. Progress is being made, slowly, on integrated ticketing for public transport but a similar approach is needed elsewhere. For example will it be possible to have one account to handle all Thames tolled river crossings?

The bus networks should not be overlooked – as there is a fundamental disjunction between method of organising bus services inside and outside London. In the former it is essentially specified by TfL whereas outside it is based on competition – which had de facto produced local monopolies. TfL services reach as far as Bluewater.

There is therefore a major challenge from growth to handle the demand for movement across the South East.

Q2 Strategic Options

The answer to this question has been addressed by mode to illustrate the complexity of the issues. The fundamental point is that this is a regional issue (meaning the wider Southeast), especially in relation to the rail network, not just a London one. There is finite rail capacity which is trying to meet the growing needs of passengers, both inside and outside London. The same is true of the strategic highway network which at peak times, and in some locations all day, highly congested. There is a big question, especially outside London, where on the Commissions timescale substantial new development is going to occur.

There is a tension between what might be called a London view of the world – seeing the inner South East as a source of housing for jobs in London – and a view seeking more local jobs and meeting local housing needs. In the local context this is exemplified by the counter weight that London Paramount would offer in terms of jobs.

The Commission is not in a position to determine future development patterns: it can only work on existing commitments and some future options. Major development outside London logically requires routes that support it which will suggest which corridors should benefit from, for example, Crossrail 2 or Crossrail 1 extensions but also possibly links that do not focus on London.

In arriving at changes to the network there is a danger in trying to fit a scheme to services, rather than specifying what services are needed (as a consequence of the future demand or existing congestion) and then providing the infrastructure that serves that. Many of the quick wins have been already made and future will require more Crossrail like schemes (e.g. Crossrail 3 from South East London) on the basis that terminal platform capacity is hard to expand.

Q2 Strategic Options: Road network

The A2 past Gravesend was widened in 2008 to 4 lanes, and moved slightly south. At peak times it is running at over capacity and a number of the junctions have started to show stress. The A2 is an important part of the local road network as well as its strategic role, for example past the Ebbsfleet only it and A226 (single carriageway road on a chalk spine) provide east – west links.

⁵ London 2050 <https://www.london.gov.uk/what-we-do/business-and-economy/better-infrastructure/london-infrastructure-plan-2050>

The current Dartford Crossing is severely congested and the Government has accepted the need for additional crossing capacity. A consultation is imminent on the options that have been recently refined either at the existing crossing (corridor A) or east of Gravesend (corridor C). Gravesham opposes corridor C because of the environmental impact. The debate about route choice will take place elsewhere but the need for additional crossing capacity (along with proposals inside London) is obvious. Once a route corridor is selected delivery of this scheme should occur within the current timeframe of 2025.

Highways England is committed to enhancing the A2 junctions at Bean and Ebbsfleet junctions to deal with existing problems (Bluewater) and development. London Paramount is working on a junction enhancement at Ebbsfleet to serve both their proposal and the already consented development. Various developments are committed to contributing to such schemes. This however ignores the cumulative implications on other junctions of development across the Gravesend/Northfleet urban area. Tollgate junction (A227) is already stressed. Lower Thames Crossing will make a difference depending on the option chosen, and it is not currently clear what the net effects will be.

The role of Fastrack has already been mentioned but both it and local bus services need to offer frequent, fast and reliable services. Depending on local circumstances this may involve dedicated routes, bus lanes on existing roads and measure likes priority at traffic signals.

On the highway network there is a tension between long distance strategic flows (cross channel traffic for example) and local commute. Highways England is charged with improving the strategic network and Transport Authorities (Kent CC in this case but Medway is also relevant) the local. Private developers are expected to fund improvements for their developments, for example London Paramount as noted above is looking to build a new access road and improve the Ebbsfleet junction.

Local Planning Authorities are trying to meet their housing and employment needs in a context where there is no overview of what the region, including London, needs to meet or the national transport infrastructure needed to support it. There must come a point when the transport infrastructure cannot handle additional development where the relationship between homes and jobs is critical.

Q2 Rail network

Rail network has already been described above. 12 car schemes and power supply enhancements have or are being implemented – the current short term need is for Southeastern or successor(s) to have sufficient rolling stock to run more 12 car trains. There is a particular need for additional high speed rolling stock as peak hour trains are regularly full and standing from/to Gravesend.

Safeguarding exists for Crossrail 1 to be extended out to Gravesend (passenger services) and to Hoo junction for stabling sidings. A study is currently underway looking at the case for extension and what infrastructure would be needed. This is related to the levels of development in Kent Thameside and proposals currently being explored along the riverside in the London Borough of Bexley.

A further complication is the “with and without” London Paramount cases. The later would certainly significantly enhance the need for services east and west from Swanscombe/ Northfleet to get labour to/from the development. The Borough Council would support the extension of Crossrail to help meet the need for additional capacity on the North Kent line, given the constraints further into London. There is an obvious logic in diverting as many passengers as possible (for whom it is an appropriate route choice) onto HS1 from Ebbsfleet, Gravesend and Medway. Crossrail could then do the same at Abbey Wood leaving the rest of the traffic on the traditional lines where expanded services provision should be possible. What is required needs to be explored further.

Transport for London and others have expressed a desire (with or without taking over the franchising role and making it a concession) for regular interval services on the various routes from Dartford into London. The precise nature of these proposals is unclear both in terms of service pattern, termini, infrastructure and rolling stock implications etc. The point of all this is to illustrate that the issue is not a simple one of infrastructure and requires the balancing of a number of factors. On rail issues at least there overall balance needs to be looked at in the context of transport for the south east – not just London.

Q2 River

Currently Gravesend is linked to Tilbury by a regular ferry service, subsidised by Kent County Council and Thurrock Council. The Borough Council has invested in a pontoon off the historic Town Pier to increase the potential usage. London Paramount has discussed services from central London to serve their development (and use of the river in the construction phase) and also provide access for labour from Thurrock. The potential of the Thames should not be overlooked as a transport corridor for both passengers and freight, where for example London Paramount has identified considerable scope in the construction phase.

Q3 Crossrail 2

No direct comment on this scheme other to note the on-going tension between an all stations inner suburban service and aspirations for it to serve destinations further away which implies a different sort of rolling stock and a lack of segregation, as illustrated by Thameslink.

Q4 Funding

Any schemes for new infrastructure will require funding and the Commission will no doubt be presented with a list of projects with a combined large price tag. Traditionally major strategic schemes, whatever the mode, have been funded by Government, whether directly or indirectly. The private sector has played a role (e.g. Dartford Crossing) where tolls can be collected and a funding model constructed. The Local Government funding model is in a period of austerity and it cannot be assumed to produce any greater financial input than hitherto.

Developers are often seen as a source of funding. Major schemes certainly require major transport investment – but this is likely to be for local transport requirements and not able to meet major strategic needs on a significant scale. The Crossrail/Lower Thames Crossing type schemes with costs in the billions will still require significant subsidy. Land values in the Gravesham urban area are only able to support local transport and social facilities to make the area function. The GLA CIL approach to Crossrail funding would for that reason be unlikely to produce significant income on current land market values.

Q5 Lessons for London

This question is interpreted as applying to London and its 'commuter hinterland'. The key points are:

- Transport is a South East issue not just a London one
- There needs to be a strategic regional view
- There are major issues with capacity across a number of modes

- Need to define the 'services' needed (what that means varies by mode) to meet the demand and then define projects that produce the required outputs
- Whatever happens the resulting plan will be a compromise between a host of factors
- There needs to be cognisance of how the system operates as whole (so ticketing, paying tolls etc. is part of the whole from the user perspective)
- Obvious anomalies (e.g. TfL rail concession model versus franchising, differences in the operation of bus networks) in legal framework across boundaries that hinder integration
- Gravesham is particularly interested in:
 - Lower Thames Crossing
 - A2 junctions
 - Full use of existing rail infrastructure
 - Extension of Crossrail 1
 - Development of interchange, bus, walking, and ticketing initiatives to make the overall system work
- Development in lower value areas won't pay for the big ticket items because of scale of costs involved

8 December 2016

MAYOR OF LONDON

Lord Adonis

Interim Chair
National Infrastructure Commission (NIC)
1 Horse Guards Road
London SW1A 2HQ

Date: 15 JAN 2016

Dear Andrew

Response to the NIC's call for evidence

Please find enclosed the Greater London Authority's (GLA's) and Transport for London's (TfL's) joint response to your call for evidence on large-scale transport infrastructure improvements in London. I also comment in Appendix 1 on your study on improving the balance between electricity demand and supply and in Appendix 2 on London's wider infrastructure requirements, which I hope will provide some context and stimulus for the Commission's future work.

Context

Investment in infrastructure is more vital than ever to sustain London's projected economic and population growth, given that the city recently surpassed its previous population peak of 8.6 million set in 1939.

The capital's economy is vital for the rest of the country and is an extraordinary national asset - one of only a handful of truly global cities on the planet. In preparation for this new era of growth, in 2014 I consulted widely on an infrastructure plan for the capital, setting out where growth is likely to come, the long term infrastructure requirements for the capital to 2050, how much they might cost, how we might pay for them, how the plan can adapt to technological change, and how infrastructure delivery should be better coordinated. Appendix 2 provides more background.

Crossrail 2 – the right scheme for London

With regard to new large scale transport infrastructure, my top priority and my first request for government funding is Crossrail 2. I am delighted that the NIC as an independent body can look afresh at this scheme. I am convinced that once the detailed analysis that already exists on this and other potential options is examined, the Commissioners will confirm their support for it.

It is the right scheme for London and the South East because of its unique combination of benefits, amongst which it will simultaneously:

- relieve a series of transport bottlenecks that exist on a network upon which central London's economy depends;
- provide new connections between areas of significant housing potential across the south east and London's main employment centres, thus boosting housing supply to support employment growth;
- support some of the most deprived parts of London.

MAYOR OF LONDON

Critically, it has overwhelming public support, which also means that it can be implemented with relatively little controversy or opposition. It has for many years had its route safeguarded; all other potential schemes would require years of development to get them to an equivalent stage. As part of its development, many alternatives have been considered, including enhancements to the existing rail network and smaller rail schemes. It is clear that no feasible alternative schemes, either individually or cumulatively, could generate the combination of capacity and connectivity benefits that together offer the transformative impact on economic performance that Crossrail 2 is expected to bring about.

Consequently, Crossrail 2 is my considered priority and that of TfL's Board. As you know, it also commands the support of London's business community.

I am now ready to proceed to the next stage of this project's development for which I need the Government's full support. We cannot relive the experience of Crossrail 1, which was conceived in the 1940s, took shape in the 1970s and 1980s, was (unjustly) rejected by Parliament in the 1990s, resurrected by my predecessor and me in the 2000s and will at last open in 2019, nearly 80 years after being first mooted. I am sure that you will want to help us all do far better for Crossrail 2. It is important that we do not keep going back to square one when there is a viable and popular scheme on the table. I have a brilliant team in place to deliver it. To put it another way, from now on, every six months delay by the Government will result in up to £4b in lost benefit including thousands of homes that could be built at or near a Crossrail 2 station.

Funding

There is no doubt that Crossrail 2 will be expensive, but I believe it is eminently affordable. During construction, its costs will be a small fraction of the regional economy that it will serve for decades, if not centuries, to come. We estimate it could deliver an economic boost of up to £7.9b per annum. Its construction will create 60,000 jobs and it will provide opportunities throughout the national supply chain, as has been the case for other major projects in London, including Crossrail 1 and the preparation for the Olympic Games.

Crossrail 2 should be funded ultimately by those who will benefit from it most, including those whose property values will increase as a result of the decision to build. We have time to develop a set of policies to capture a proportion of this value uplift to pay for the scheme, but we need to make good progress soon. I would also expect contributions from those outside the capital who will benefit from it.

Insofar as we remain a highly centralised state, fiscally, then we will continue to rely on government grant to fund it. Economically that would be rational given Crossrail 2's boost to a regional economy whose taxes go largely to the national exchequer. However, I have argued consistently for the devolution of fiscal powers to enable us to pay for much more of it (and other schemes) ourselves. Such powers could include a variety of taxes and similar instruments highlighted in the submission. The political acceptability and economic appropriateness of these can and should be assessed in more detail during the development phase. What is not acceptable is neither grant nor the powers to pay for the scheme ourselves, if the strength of the rest of the business case is accepted.

MAYOR OF LONDON

Development funding

I am asking the NIC to recommend that the Government take the necessary steps to enable a Hybrid Bill to be submitted before the end of this Parliament. This requires an application for statutory powers in the coming years which would allow the delivery phase to commence in 2020 and the scheme to open by 2030. The sponsorship and consent costs associated with this are £250m and we are seeking the NIC's support for funding from the Transport Development Fund for a significant proportion of this. If insufficient funding is made available for these activities there is a risk of setting the project back by at least half a decade, which could constrain London's growth.

Key considerations for determining the appropriate allocation of national resources for major new 'national' infrastructure are set out below. These are intended to assist the NIC in making its recommendations to the Government on prioritising national resources for large scale transport infrastructure - and more immediately those required for planning and developing them:

- the scope for unlocking genuine economic potential through intensifying or transforming the way land is used, as expressed through economic performance measures such as GVA, and the extent to which this is additional at the national level;
- the key constraints that prevent people and places from realising their economic potential, including both transport bottlenecks and shortages of housing;
- the wider impacts including the sustainability implications of alternative strategic choices;
- the 'economic payback' of large scale infrastructure investment and the implications for national level funding through the impacts on fiscal receipts associated with the economic performance benefits;
- the opportunities for regional and local funding from development that is unlocked and other sources;
- the pressing nature of the strategic challenges and the timescale for addressing them, in particular the threats to continued growth arising from constrained transport capacity and inadequate connectivity as population pressure increases.

Conclusion

Overall I believe that once Crossrail 2's benefits are viewed holistically, its top ranking priority becomes clear. It will underpin new urban areas, support our nationally critical employment centres, boost the supply of homes, provide a large number of jobs, support a national supply chain, deal with major transport bottlenecks, give a lift to areas of national disadvantage, and reinforce a transport network that underpins the country's most productive region. It thus already commands widespread support. It is now time to get behind it with proper funding so we can build it in the 2020s.

I am confident that your Commission will support Crossrail 2. My team and I look forward to our continuing discussions and we will try to supply whatever further detail you may require.

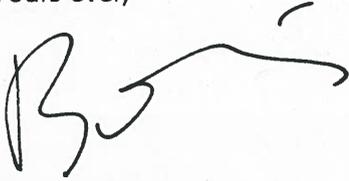

Other projects

For the avoidance of doubt, my only call on the NIC's Transport Development Fund is for Crossrail 2. More broadly, I also support a submission by the Chair of the West Anglia Taskforce on 4-tracking of the West Anglia Main Line, setting out its potential as a prerequisite to, and to bring forward the benefits of, Crossrail 2 (as set out in paragraph 32 in this submission); and a separate submission being made by a number of parties including the London Borough of Bexley on the

MAYOR OF LONDON

case for extending Crossrail 1 eastwards, which could enable substantial growth in the south eastern corridor from London towards Ebbsfleet and Gravesend. These and other schemes, such as the Bakerloo line extension and A13 Riverside tunnel that we are developing, are important parts of the necessary pipeline of transport investment described in paragraphs 34-40 of the submission, but for which we are not seeking funding (at least at this stage) from the Transport Development Fund.

Yours ever,

A handwritten signature in black ink, appearing to be 'Boris Johnson', written in a cursive style.

Boris Johnson
Mayor of London

LONDON'S LARGE SCALE TRANSPORT INFRASTRUCTURE REQUIREMENTS

**GLA / TfL Submission to National Infrastructure
Commission**

January 2016

Contents

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?	Page 1
2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?	Page 11
3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?	See separate submission
4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?	Page 17
5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?	Page 19

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

1. Since the advent of the modern Mayorality in 2000, London has benefitted from its ability to undertake integrated strategic planning. There is a suite of statutory and non statutory documents that draw on a common evidence base developed and tested by the GLA and its functional bodies (including TfL):
 - The London Plan¹ and Mayor's Transport Strategy (MTS)² in particular set out a clear strategic policy framework for planning London's growth over the next 20 years.
 - In 2014, the Mayor also published a London Infrastructure Plan for 2050 that looked beyond this horizon.³ This reflects some of the emerging challenges that have become clearer since the publication of the MTS in 2010, including stronger population and employment growth than previously anticipated and the scale of London's housing supply shortage, which were described in the Crossrail 2 Strategic Outline Business Case (SOBC). These are expected to be addressed in an updated MTS following the 2016 Mayoral election, in the context of the new Mayor's overall priorities.

Summary of key challenges

There will continue to be a critical national role for London in driving sustainable economic growth

2. The UK will be competing in an ever more globalised world in which large cities will play an increasingly important role as the economic dynamos⁴. London is at the heart of a network of world cities that have led this process and the UK benefits greatly from hosting one of these global centres. An important economic challenge facing London over the next few decades is to maintain and extend this role.
3. London hosts a major cluster of globally competitive sectors in and around its centre which benefit from large economies of agglomeration⁵ and this represents a source of UK comparative advantage in the world economy. The relationship between employment density and productivity in the 100 largest employment centres is illustrated in Figure 1. The evidence for economic mass and productivity effects is set out in the DfT's Transport Investment and Economic Performance report⁶.
4. Ready access to a very large population catchment as illustrated in Figure 2, is fundamental to London's ability to act as a global employment centre. This depends critically on the transport

¹ <https://www.london.gov.uk/what-we-do/planning/london-plan/current-london-plan>

² <https://www.london.gov.uk/what-we-do/transport/our-vision-transport/mayors-transport-strategy>

³ The Transport Supporting Paper in particular considered London's economic and social challenges:

https://www.london.gov.uk/sites/default/files/Transport%20Supporting%20Paper_3.pdf

⁴ McKinsey (June 2012), Urban world: cities and the rise of the consuming class

⁵ A number of locations make up London's global employment core (the West End, City, Isle of Dogs; Stratford is emerging as a further centre and may be joined by Old Oak Common). All are dependent on a shared set of network benefits generated by the radial transport system focussed on central London.

⁶ https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/386126/TIEP_Report.pdf.

See Chapter 3, pp30 – 41.

network serving London and the wider south east⁷, which remains one of the densest and most comprehensive in the world, and which consequently represents a national asset of immense value.

Figure 1: The relationship between employment density and productivity in the 100 largest employment centres

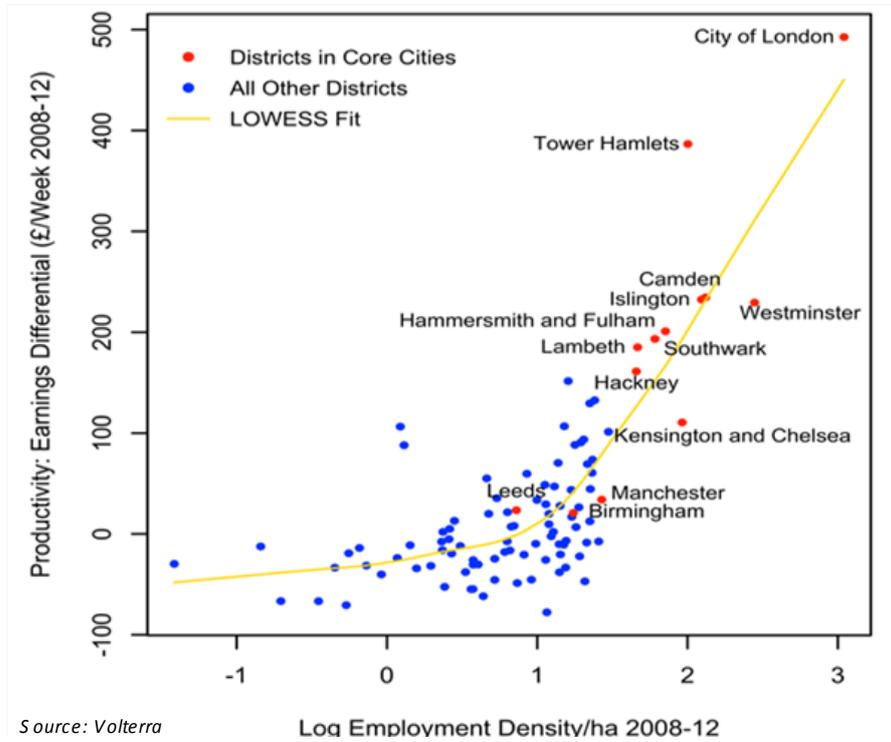

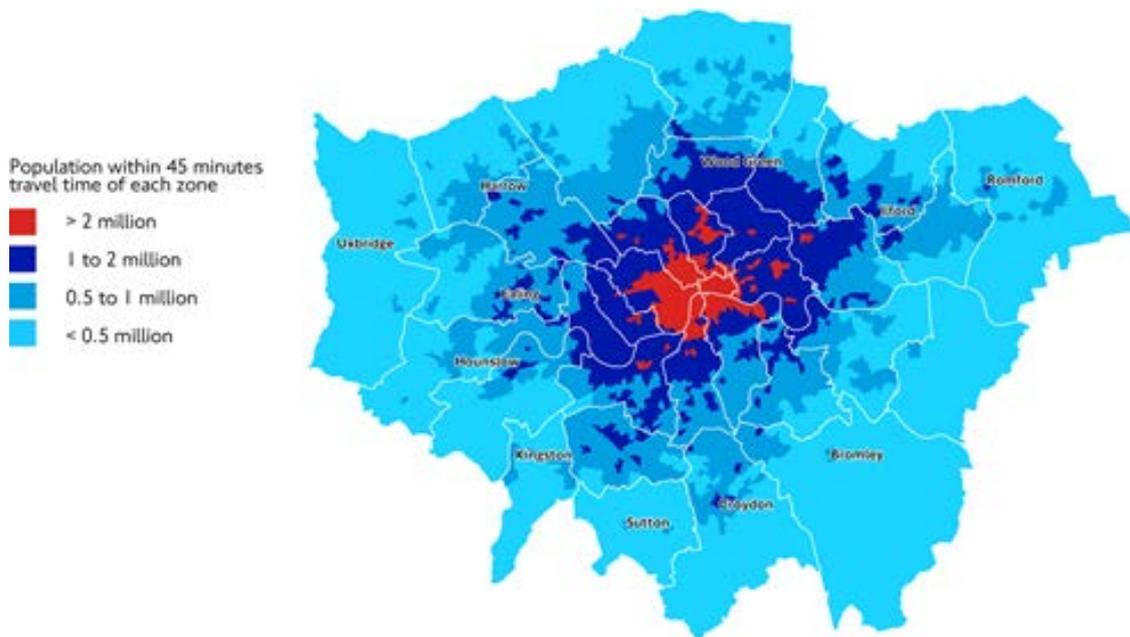

Figure 2: Accessibility: total population within 45 minutes' travel time

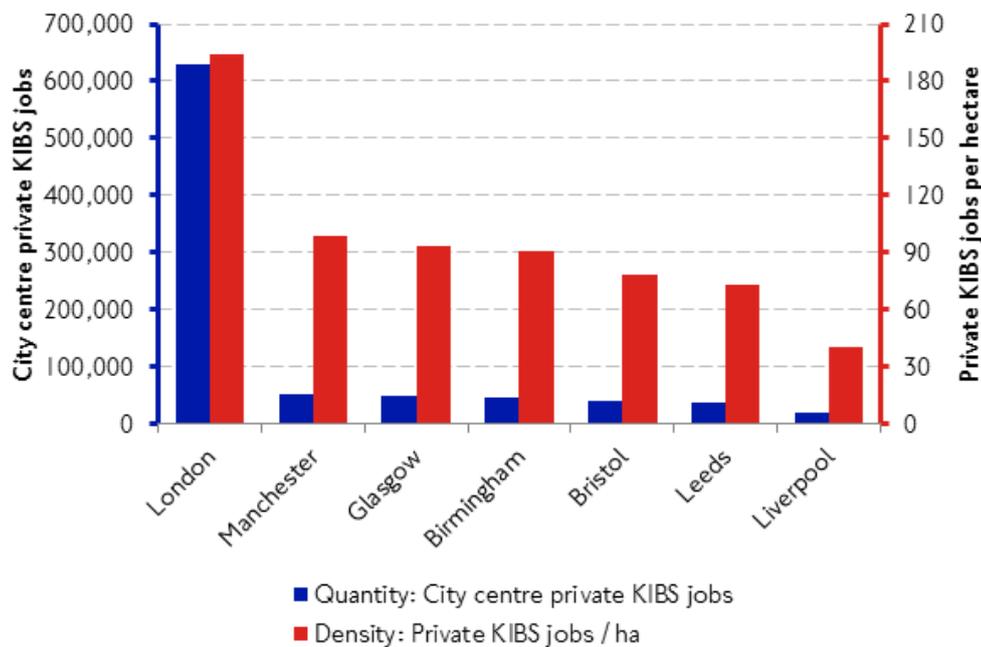

⁷ Around 1 million London workers live outside the city.

- There is in fact considerable scope to further increase employment density in London’s global employment core and to unlock substantial additional economic potential. Doing so will depend on further expanding the labour supply on which the area can draw.

The economic potential cannot be unlocked through any feasible alternative means, eg through ‘decentralising’ employment growth across different parts of London or other UK city centres

- London’s employment core hosts around 12 times the volume of Knowledge Intensive Business Services (KIBS) activity that each of the next three strongest centres host, at around twice the density, as shown in Figure 3. It is clear from this that to replicate in other UK cities the conditions that support London’s global role would require investment on a vast and likely unaffordable scale.

Figure 3: The volume and density of knowledge intensive business services jobs within seven UK city centres⁸

- While there is a strong case for making the UK’s other major city centres more internationally competitive by growing them, it is vital that this is seen as complementary to efforts to build on London’s existing strength rather than as an alternative to it. If London loses its competitiveness in the global markets in which it competes, overseas cities that can compete for these markets, rather than other UK cities, will attract much of the activity that is displaced. In this scenario the whole UK will lose out, including other cities which benefit from the interrelationships with London as a global hub. It is worth noting that cities such as Paris have plans for massive investment in new public transport to boost their competitiveness.⁹

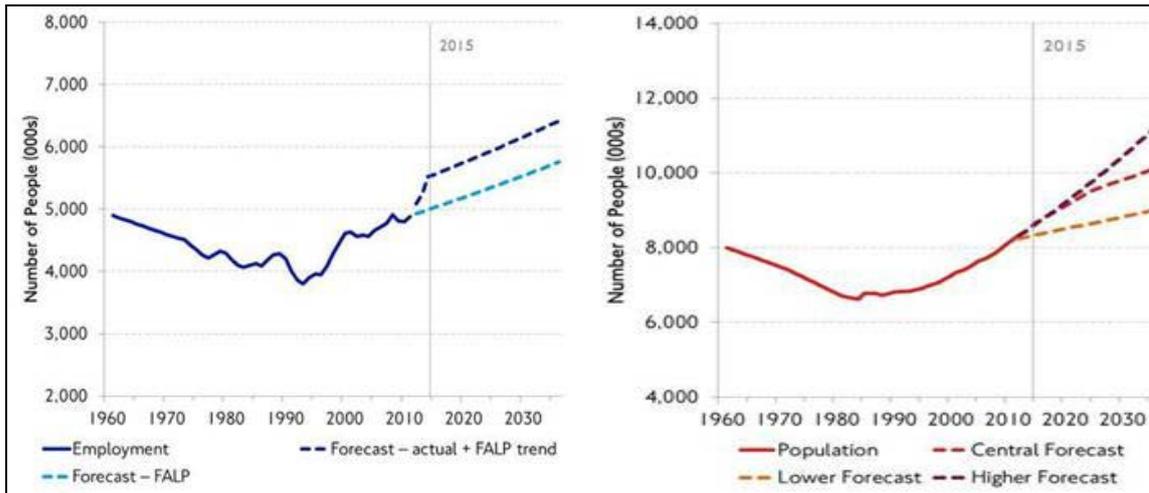

Growth in London’s employment core will drive population in the wider city and region, in turn sustaining employment growth in other parts of London and far beyond

⁸ Based on data from “Investing in City Regions,” Volterra, November 2014.

⁹ €40 billion of investment is committed to public transport to support the “Greater Paris” project.

8. London’s population is forecast to increase from 8.6m million to over 10m by 2036 while employment is projected to grow by 700,000 to 6.3 million, with recent forecasts suggesting even higher growth is possible. This depends however on supportive policies to expand the effective labour supply available in London’s key employment locations. Without these the likely outcome, based on historical trends, illustrated in Figure 4, is not stability but a failing economy and decline, with serious implications for the wider national economy. In particular there is a need to tackle the major threats that transport and housing supply constraints represent.

Figure 4: Historic trends and projected growth in London’s employment and population to 2036

9. London’s economic growth is fundamentally dependent on rail and tube capacity and connectivity – eight in ten arrivals in the morning peak are by rail (including the Underground and Docklands Light Railway). Despite committed investment, the scale of growth in travel demand is such that between 2011 and 2041, crowding is forecast to increase by 60% on the Underground and 150% on rail services¹⁰. Some of the greatest pressures on TfL and national rail services are on a north east / south west axis, which is benefiting relatively little from the current or planned investment. Whilst the current focus is on east-west (Crossrail) and north-south (Thameslink), the north east – south west axis has been acknowledged as needing additional capacity for many years.
10. The pressures are already being felt, with 8 out of the 10 busiest days in the history of the Underground being in October and November 2015. There are also enormous growth challenges on the national rail network. For example, the South West main line into Waterloo, the busiest section of the network, requires approximately 20% additional capacity to deal with existing overcrowding even before anticipated demand growth of 40% to 2043. This represents a key economic challenge since it has major implications for London’s labour supply. For example:
- it threatens to reduce people’s willingness to participate in London’s labour market;
 - access to the network is constrained at times, ie station closures owing to crowding;
 - other productive trips are crowded out;

¹⁰ There has been a shift from car to public transport over the last 15 years of around 11 per cent.

- there has already been substantial ‘peak spreading’, and further opportunities for retiming trips are limited.

To ensure London has an adequate supply of labour in the future housing supply constraints must be tackled

11. The London Plan identifies a need for 49,000 new homes per year,¹¹ while delivery has been around half this rate over the last 10 years or so. The resulting poor affordability of housing reduces the quality of life the city offers its labour force, which has damaging consequences for its international competitiveness:
 - business leaders rate the cost of housing as the second most important obstacle to improving London’s competitiveness;¹²
 - the functioning of the city depends on the availability of a variety of workers including those on lower pay;
 - the inequitable nature of access to London’s housing market is starting to damage its reputation as a city of opportunity and will affect the ability of London firms to recruit and expand.
 - there are also indirect economic impacts through impacts on disposable incomes.¹³
12. Capacity has been identified within London for 423,000 homes over 10 years,¹⁴ and the 2015 London Plan has put in place new policies to support additional supply through higher density development, linked directly to public transport accessibility. Assuming the backlog has already been made up, capacity (not yet identified) is expected to be needed for a further 500,000 homes in the decade from 2025. The London Plan identified key Opportunity Areas (including the Upper Lea Valley) and Areas for Intensification.

Despite its overall economic strength, there remains widespread and persistent social deprivation together with serious economic underperformance resulting from it

13. Tackling the inequalities in life chances that exist in London, by becoming a city of genuine economic and social opportunity for all, will not only be valuable in itself but will improve the quality of life of the city as a whole and strengthen its competitiveness. London’s complex and diverse economy depends on its ability to attract a wide range of workers at different income levels. It is worth noting that almost a quarter of London’s workforce earns less than the London Living Wage. Meanwhile, lower income workers are moving further out, leading to a ‘hollowing out’ effect and transport has become more unaffordable for such workers,¹⁵ threatening the ability of London’s core employment locations to attract the workforce balance needed in the future.

¹¹ To also address the existing backlog, 62,000 new homes per year will be needed.

¹² London First, “Home truths,” March 2014

¹³ Cushman & Wakefield Affordability Watch 2015

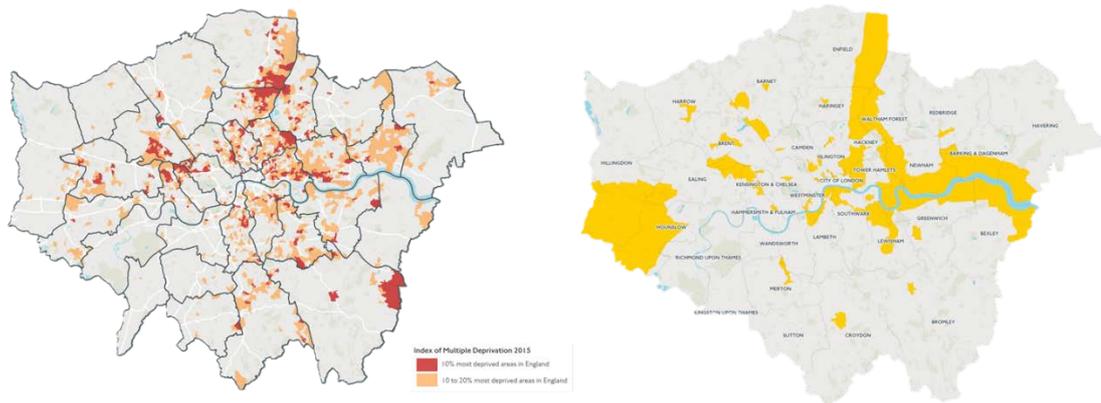

¹⁴ It will be critical in this period to ensure that the pipeline of approved units translates into delivery. Whilst on average over 50,000 housing units are given planning approval in London each year, only around 27,000 units are actually delivered. There is currently a pipeline of 261,000 approved units.

¹⁵ In 2014, it took at least an additional hour of work at National Minimum Wage to cover travel costs from outer London compared to 2005.

Furthermore, the social exclusion this could lead to could have wider consequences, damaging the reputation of the city as a place to live and invest in.

14. Pockets of deprivation exist across London and there are some geographical concentrations as shown in Figure 5.

Figure 5: The distribution of deprivation in London, 2015 (left) and London's Opportunity Areas and Areas for Intensification (right)

Some of the greatest unrealised opportunities for development are in locations in most need of regeneration

15. There is a close correlation with the Opportunity Areas identified in the London Plan, as shown in Figure 5. The Opportunity Areas:
 - are generally former industrial areas, with historically poor transport links to central London;
 - are typically trapped in a cycle of a poor quality built environment and low investment, remaining isolated from the wider success of the city;
 - represent London's main reservoirs of brownfield land and unlocking comprehensive development in them must play a crucial role in accommodating London's housing and employment needs.
16. The problems these areas face are of a scale and complexity that require coordination, in a way that markets alone are unable to achieve. New transport is a vital element and can act as a powerful coordinating mechanism for the other investment that is needed to bring about regeneration.

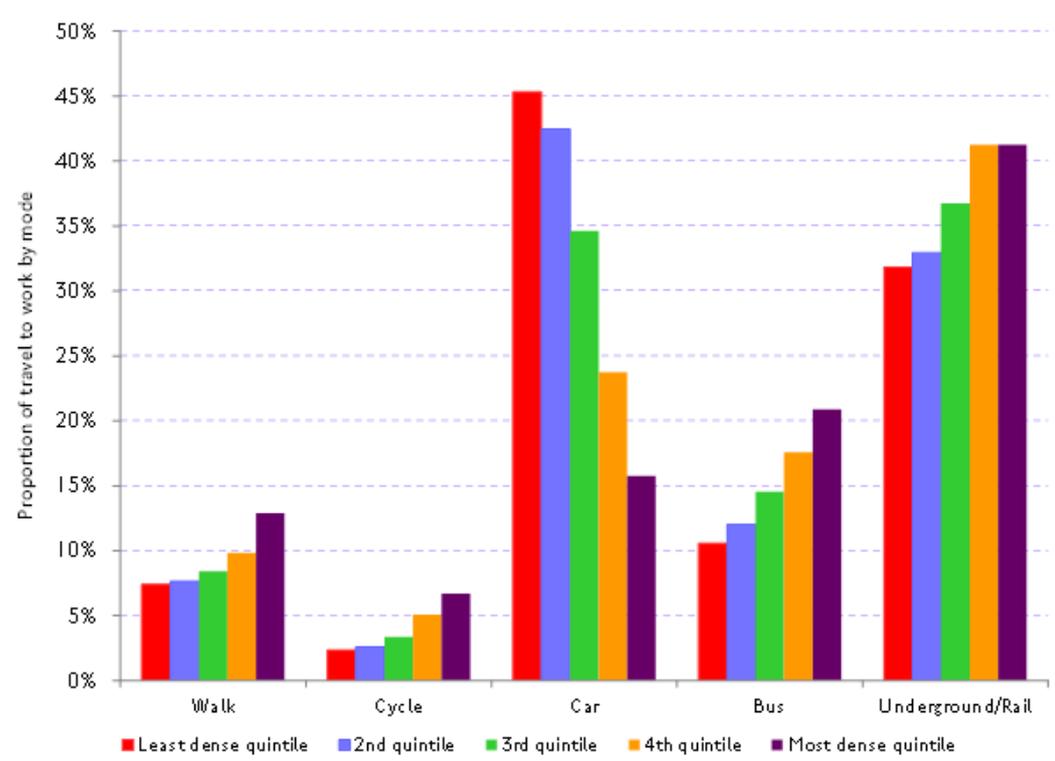

Additional housing potential must also be unlocked more widely across inner and outer London if we are to meet the overall needs identified above

17. While London’s town centres remain vital to the city’s economy, many major and district centres face decline in their traditional roles in retail and office markets. There are, however, opportunities for boosting housing supply in these locations in an affordable and sustainable way through transit oriented residential development. New connections can change market expectations, unlocking investment to make denser and better quality housing viable. This will help gain local communities’ acceptance for additional housing beyond that which they are already required to deliver. Planning policy also requires adequate transport provision as a condition for development.

Transport investment is essential to enabling the higher density development needed if London is to meet its growth challenges sustainably

18. The relationship between housing densities and travel behaviour in terms of choice of mode for journey to work is shown in Figure 6. This shows that 15% of people living in the densest fifth of London use car for travelling to work while 45% do so in the least dense fifth of the city. Given the congestion pressures facing London’s roads¹⁶, this indicates the importance of new housing being delivered through transit orient development at high densities.

Figure 6: 2011 travel to work mode shares of London LSOAs¹⁷ by density quintile

¹⁶ The rate of growth in congestion we now expect on London’s by 2031 has doubled, from 15% forecast in the MTS to 30%.

¹⁷ Lower Super Output Areas.

19. Improvements to the quality of London's urban fabric and environment will be important in maintaining and enhancing London's global competitiveness. Ensuring that new development and urban realm are well designed directly contributes to people's quality of life and well-being and will be ever more important as densities increase.

20. There are also growth pressures to accommodate more housing beyond London's boundaries. Focussing London's growth as far as possible within its boundaries is more sustainable than the alternatives and the London Plan aims to accommodate London's forecast population growth and need for housing within the Greater London boundary. Transport investment is critical to enabling the densities that this will require. Delivering more housing in reasonably close proximity to key employment areas also makes sense if we are to ensure an appropriate range of workers are available to meet London's labour supply requirements.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- **How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

21. In recent years there has been an ambitious programme of investment to both expand London's public transport system and renew and upgrade the existing assets. Crossrail and Thameslink will be fully open within the next four years and the programme of modernising the Underground is well underway. This scale of investment has been possible through growing fare revenues, a strong commitment from successive Governments with grant funding, and prudential borrowing.
22. Key priorities for the coming years include the re-signalling of the Circle, Metropolitan, District, Hammersmith and City Lines and the Deep Tube Programme, which will mean new rolling stock and signalling on the Piccadilly, Central and Bakerloo Lines. We also need to get the most from London's existing railways - creating additional capacity on the network by introducing faster, more frequent, metro-style services and maximising the benefits of the heavy rail infrastructure that is already in place.
23. This investment will keep London moving for the next decade or so – ensuring that the large and complex public transport network can handle growing demand and at the same time enable a shift away from car use and meet transport users' growing expectations. It is vital that this programme is continued and its importance was recognised in the provision for capital grant funding made in the 2015 Spending Review (although the implications of the removal of the revenue grant need to be more fully understood).

The need for a pipeline of long term infrastructure investment, with Crossrail 2 at its heart

24. It is clear however that a pipeline of further large scale strategic interventions to provide 'new infrastructure' are going to be needed to meet London's growth challenges beyond the next ten years. This will help drive long term productivity and improve the public finances. We are cognisant of funding and supply constraints and our aim is to develop this into a coherent, phased and manageable programme that is affordable for London and the UK, with a strong focus on managing down costs and maximising value for money. A stable long term pipeline of investment will offer greater certainty for our supplier base, allowing better planning. Failing to achieve this can add 15% to project costs.
25. London's integrated strategic planning process, with the London Plan and the MTS at its heart, provides a framework for identifying and prioritising investment needed over the next 20 years, with TfL's business planning cycle providing more detailed prioritisation over the shorter term. The Mayor has also produced a 2050 Infrastructure Plan for London which looks to the longer term.

Together, these processes address all the different dimensions, geographies and transport modes involved in a city such as London over multiple decades

26. It is likely that new versions of the London Plan and MTS will be produced for the next London Mayor. We do not want to pre-empt this wider process here – but it is clear already that Crossrail 2 will need to be at the heart of these strategies and the pipeline of schemes and the NIC must support its ongoing development as a matter of urgency. Such an intervention requires a significant commitment of resources at the planning and development stage. Without this it will not be possible to meet the timescales for delivery that are required to meet the overall strategic planning challenges that have already been identified and are generally agreed upon.

Our focus for the NIC

27. Key considerations for determining the appropriate allocation of resources for major new ‘national’ infrastructure are set out below. Given the focus of the NIC these are narrower than those which underpin the London Plan and MTS. These are intended to assist the NIC in making its recommendations to the Government on prioritisation of national resources for large scale transport infrastructure – and more immediately those required for planning and developing them. The following should be considered:
- the scope for unlocking genuine economic potential through intensifying or transforming the way land is used, as expressed through economic performance measures such as GVA, and the extent to which this is additional at the national level;
 - the key constraints that prevent people and places from realising their economic potential, including both transport bottlenecks and shortages of housing;
 - the wider impacts including the sustainability implications of alternative strategic choices;
 - the ‘economic payback’ of large scale infrastructure investment and the implications for national level funding through the impacts on fiscal receipts associated with the economic performance benefits;
 - the opportunities for regional and local funding from development that is unlocked and other sources;
 - the pressing nature of the strategic challenges and the timescale for addressing them, in particular the threats to continued growth arising from constrained transport capacity and inadequate connectivity as population pressure increases.
28. The current MTS and London Plan both contain explicit support for prioritising a major new radial rail route serving central London on a northeast – south west axis and the Strategic Outline Business Case submitted to the Government in June 2015 sets out the case for this in detail, together with the expected impacts on capacity, journey times, housing supply, employment and productivity.
29. In particular, the scheme provides a major expansion of the system of radial transport links serving London’s global employment centres. This will relieve the growth constraints that are expected by the time it is due to open in the early 2030s. As well as solving a series of critical transport bottlenecks, it will connect the network serving London’s global employment centres to major

development areas, facilitating the dense new housing needed to help meet London's long term labour supply requirements. The key benefits include:

- crowding relief to a network forecast to be operating under stress despite significant planned and committed transport investments reflecting a combination of faster and more direct journeys, less crowded conditions on-train (notably SW, WAML, Victoria and Northern lines) and relief of crowding and delay at key stations, such as Waterloo, Liverpool Street, Euston and Vauxhall. For example, the scheme would contain growth in national rail demand at Waterloo - which currently stands at 82 million passengers per year - to 13% growth by 2041, rather than 50%;
- significant journey time benefits, eg a reduction of around 15 minutes between Wimbledon and Tottenham Court Road;
- 200,000 net additional homes (with appropriate new planning policies in place) over 20 to 25 years across London and the SE (the Crossrail 2 Growth Commission is reviewing this and an update will be provided to the NIC as part of TfL's 12 February submission). The land value uplift associated with these close to route homes only, and the associated impact of improved transport capacity and connectivity on housing density they represent, has been assessed at £15bn PV;
- once operational, up to 200,000 new jobs - between 50,000 and 70,000 new local jobs as a consequence of enhanced development, and some 135,000 in central areas;
- in addition there would be temporary employment of up to 60,000 construction jobs (including supply chain).

30. As part of the development of Crossrail 2, many alternatives have been considered, including on Network Rail solutions as well as alternative schemes. While it is feasible for a package of alternative schemes¹⁸ to address some of the problems in the same corridors, there are considered to be no feasible alternative schemes, either individually or cumulatively, that could generate the combination of capacity and connectivity benefits that offer the transformative impact on economic performance that Crossrail 2 is expected to bring about.
31. The critical feature of Crossrail 2 is that it provides large scale new capacity across central London that addresses a series of bottlenecks associated with the mainline termini and onwards links from them. In contrast, improvements to national rail corridors in isolation would place extra pressure on London's crowded main termini, and on key pinchpoints on the Underground network. For example, while four tracking the West Anglia mainline is a prerequisite to Crossrail 2, its full benefits are contingent on the extra capacity within and across central London that Crossrail 2 delivers. Similarly, the benefits of increasing capacity on the South West mainline depend on the elimination of other bottlenecks on the routes that link it to the main employment centres.
32. By tackling a series of critical network bottlenecks and creating new and better connections (easing housing supply constraints on future labour supply), Crossrail 2 will facilitate a significant increase in the overall economic density of London's key global employment centres. This is the basis for the estimated increase in numbers of jobs of 135,000 in these very high value areas. The resulting net

¹⁸ for example four tracking the West Anglia lines between Tottenham Hale and Broxbourne, with five tracking improvements into Waterloo

additional Gross Value Added (GVA) to the UK economy is estimated to be in the range of £1.2bn – £7.9bn per annum by 2041 (ie up to £102bn). This analysis shows how Crossrail 2 offers the opportunity to achieve significant increases in the productivity of London and the UK and to cover much of its costs through increased wealth generation and tax receipts. Nevertheless given the widely dispersed nature of the issues that together need addressing if London is to meet its strategic challenges effectively, it is clear that no single scheme will on its own be enough.

33. We are asking the NIC to recommend that the Government take the necessary steps to enable a Hybrid Bill to be submitted before the end of this Parliament. This requires an application for statutory powers in the coming years which would allow the delivery phase to commence in 2020 and the scheme to open by 2030. The sponsorship and consent costs associated with this are £250 million and we are seeking the NIC's support for funding from the Transport Development Fund for a significant proportion of this. If insufficient funding is made available for these activities there is a risk of setting the project back by at least half a decade, which could constrain London's growth.

Integrating more areas into the transport network

34. This is why Crossrail 2 is the focus of our ask to the NIC. Nevertheless given the widely dispersed nature of the issues that together need addressing if London is to meet its strategic challenges effectively, it is clear that no single scheme will on its own be enough.
35. A mixture of further strategic, intermediate and smaller scale schemes is needed beyond Crossrail 2 to unlock development and tackle particular challenges by knitting more parts of the city into the transport network. This will fill gaps in connectivity to enable more areas of the city to fulfil their potential, help address London's housing challenge, and ensure Londoners can access the opportunities and benefits of the city's growth.
36. This includes schemes such as a Bakerloo Line Extension, which will improve connections between central London and key opportunity areas in south east London, unlocking major housing potential and an extension of Crossrail beyond Abbey Wood towards Ebbsfleet which will help realise the housing potential of a key area of the Thames Gateway. These will help develop other corridors that complement the cross London 'spines' of Crossrail, Thameslink and Crossrail 2.
37. We are not seeking funding from the NIC for these other schemes but would welcome the support of the Commission for greater devolution of powers and funding mechanisms to enable cities like London to develop and progress such a pipeline of investment to help drive economic growth for the UK and tackle the challenges we face.
38. For example, in more recent years there has been an increasing focus on ensuring a similar 'upgrade programme' for our roads, as well as rail. London's roads are vital to the efficient day to day movement of people and goods and in fact support the majority of journeys made in the city. The Roads Modernisation Plan represents the first tranche of investment associated with this programme. It does not however provide sufficient funding to realise the fuller vision; in fact a large funding gap exists for sustained and more strategic roads investment.

39. Unlike public transport modes, which generate revenue from fare payers, there is very little cost recovery on the roads. Under the new system of VED announced by Government, revenues will be ring-fenced for spending on strategic roads in England (those operated by Highways England) from 2020/21. It is vital that the strategic road network within London (which was transferred from the Highways Agency in 1999) also benefits from this funding stream, with projects such as New Thames crossings vital to unlock jobs, homes and growth across the east of London by addressing the severance that hinders integration of the economy north and south of the river.

40. TfL is working on a number of these potential infrastructure options to address the range of different challenges which will inform the development of any new MTS. But these are not alternatives to Crossrail 2.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

See separate submission with agreed deadline of February 12th .

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

41. Following the 2015 Spending Review, TfL's Operating Grant is being phased out; and, in light of the prospective full devolution of business rates, it is possible that from the 2020s funding of the renewal and upgrade of TfL's core Underground and rail network will come entirely from non-Government sources (i.e. a combination of fares, third party income and local taxes such as council tax and business rates). This represents an unparalleled step-change in TfL's relationship with central Government as TfL transitions to financial self sufficiency.
42. London is unique in that many of its transport projects have a substantial economic benefit and are partly or even fully self-funding, even under the current fiscal regime in which less than ten per cent of taxes paid in London are retained in London. The extent to which different schemes require central Government funding varies, with schemes such as the Northern Line Extension being entirely locally funded through developer contributions and retained growth in business rates. Crossrail has a Government contribution of around one third of the cost.
43. Building on PwC's 2014 Funding and Financing Study, the Crossrail 2 Business Case shows that London could contribute over half of the funding for the project, through direct contributions and borrowing against a variety of sources:
- Net revenues generated by train operations;
 - Over Station Development / sale of surplus land;
 - Continuing the Mayoral Community Infrastructure Levy (CIL), at an increased rate;
 - A continuation of the Business Rate Supplement (BRS) – currently hypothecated to Crossrail 1 – beyond the repayment of Crossrail debt;
 - continuation of the London-wide Council Tax Precept originally established for the Olympic Games, currently due to end after 2017/18.
44. If we are to be able to increase London's contribution to Crossrail 2 (and fund other needs of a rapidly growing city at the same time), then we need to enhance London's ability to capture and retain the additional revenues that will result from the economic benefit of major transport improvements, including effects on property values and business taxes. This could include consideration of:
- Stamp duty land tax (e.g. as a 'payment by results' mechanism within specified zones where growth in housing would be unlocked, or more widely, linked to delivery of housing targets);
 - Enhanced retention of business rates (including the proceeds from revaluation as well as stock growth);
 - Reform of residential property taxes (council tax)

- Borrowing capacity for opportunistic early land acquisition around planned transport investment corridors (as many local authorities, who do not face the same borrowing restrictions, do);
- CPO and MDC power to assemble land ahead of formal funding announcements;
- TfL to acquire land compulsorily not only for transport, but also for regeneration and housing;
- TfL to grant long leases on new residential buildings above its stations;

45. Some local sources of funding have limits. Fares on the Underground network are already quite high in London relative to other major cities around the world, but TfL currently does not achieve an operational surplus on its business as a whole so as to be able to fund major incremental capital investment. The ability of the Mayor to impose higher local taxes or to raise debt is severely constrained by central government. Congestion charges already fund a proportion of investment on the roads network, but in fact, relatively little revenue in London is raised from the roads, in stark contrast to the over 30% of TfL's income that comes from Underground and other fares. This means road improvements are either reliant on central government grants or contribution from public transport users. The Silvertown project will be funded by new tolls on road users, which could offer a model for a way forward for some schemes, but will not help solve the wider problem of how to provide the funding needed to cater for a growing population.
46. Londoners pay about £0.5 billion a year through Vehicle Excise Duty (VED). This money currently goes to central Government for general public expenditure, but from the end of the decade, all VED in England will go into a Roads Fund to pay for sustained investment on the English Strategic Road Network (the network managed by Highways England). Given that VED is linked to the specific address of the vehicle owner, there is a particularly strong and justifiable basis for hypothecation of the revenue raised in London for use on its strategic roads or transport infrastructure, or devolution of the power to determine VED structure to London.
47. It is likely however that even the sources set out above will be insufficient to fund the investment needs of transformational schemes such as Crossrail 2, as TfL has made clear in its submission. Crossrail 2 also generates a very significant proportion of its transport benefits (around 30%) from origins outside London, as well as housing impact in the wider South East, national supply chain impacts, and significant employment and productivity gains at the national level, so in the absence of more radical devolution proposals (which are likely to be many years hence), support from the Exchequer is both appropriate and necessary.
48. As regards financing and delivery, TfL's investment programme is financed using a mix of sources including borrowing from the PWLB, from the capital markets, and using private finance in models for projects such as the Silvertown river crossing. In each case, the decision is made based on value for money considerations.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

49. There are a handful of city regions in the world of a similar scale and level of development to London¹⁹, including Paris²⁰, New York²¹, Hong Kong²² and Singapore²³. While all of these cities face competitive challenges, London is growing at a faster rate than the others²⁴. All have policies in place that seek to encourage higher density development around rail stations, reduce dependence on the private car and support greater use of sustainable modes. London can be regarded as a strategic planning leader, with well integrated land-use and transport strategies in place to deliver sustainable growth. It has been unique in delivering a major shift away from car and to more sustainable modes in terms of relative shares (around 11% since 2000). However, compared to other cities the funding to support growth is less secure and the time cycle for funding is not integrated with planning cycles.
50. In Paris, the planning authorities and RATP have developed a long term land-use planning and transport investment strategy, known as 'Grand Paris' with an estimated investment requirement of €200 to €300 billion of investment to 2025 (although this horizon is now expected to be extended). The plan includes 100 major urban reconstruction projects and is expected to deliver approximately 70,000 housing units per year as well as office space through densification of urban areas around new stations. Investment of €40 billion in public transport is envisaged, with a significant emphasis on improving orbital connections between existing outer high density housing areas. It is however important to recognise that the spatial development context in Paris is very different to London's, with greater constraints in the city centre and a more polycentric pattern of employment, which is less reliant on agglomeration benefits.
51. The city state of Singapore has had a consistent strategic policy approach towards growth and development since 1971, based on transport-orientated development along mass transit spines connecting into the central business district (CBD). Since the early 1980s Singapore has been investing in expanding and improving its metro network to improve access to the CBD. Bus services act as feeder services, with easy interchanges at metro stations and don't duplicate metro lines. The Land Transport Authority (LTA) owns metro infrastructure and invests in new capacity. There are plans in place to double the length of the metro network by 2030. Funding is provided by Government and future fare incomes, which support borrowing. Around a third of the operator's revenues are raised from non-fares sources, such as rental incomes and advertising at metro stations.
52. MTR, the urban transit agency of Hong Kong, is notable for being very active in property development not just at stations but in the catchment areas around them. The government grants

¹⁹ The population of London's metropolitan area is 13.9m using the Eurostat definition. The wider labour market catchment, extending across the wider south east has a population of 23m (GLA).

²⁰ The Greater Paris population is around 12m.

²¹ The population of the metropolitan area of New York is around 12m, with around 20m in the wider labour catchment area.

²² Hong Kong's population is 7.6m.

²³ Singapore's population is 5.5m.

²⁴ Around 1.5% p.a. in London and between 0.5% and 1.3% p.a. in the other cities.

exclusive property development rights for land in the vicinity of metro station areas to MTR below market rates. Hong Kong has been a pioneer in using this approach to fund railway projects, and other cities are increasingly looking to implement it. TfL's land holdings are more localised than MTRC and focussed on operational requirements, and there is a much more circumspect approach to the scope of planning powers, which means only land needed to meet railway requirements can be included at present.

53. New York also has a different spatial pattern to London, heavily affected by its specific site and the density of commercial and residential development in Manhattan. Plans in New York include an additional subway (2nd Avenue) and better connections between the boroughs. New York's funding reflects the set up of city, states and federal levels, and includes cross subsidy from road crossings and a small but significant employment tax. There is also the use of developer contributions for specific schemes (such as the Hudson Yards). It is worth noting that New York is receiving 50% of its funding for the 2nd Avenue & East Side Access projects (as well as 50% for the emerging proposals for a new Hudson River rail capacity project) from the Federal Government – higher than Crossrail 1 or the proposals for Crossrail 2.

Appendix 2 - Setting London in context

The challenges of growth

1. London's infrastructure challenges are closely tied to population growth, which in turn reflects the strength of its economy. London's population is growing rapidly, with the city recently eclipsing its 1939 peak of 8.6 million people. Current projections suggest that London will reach 10 million by 2030 and 11.3 million, more or less, by 2050. Such rates of growth will place significant pressure on London's infrastructure systems - most notably housing and transport, but also energy, water and social infrastructure. There are also key economic, social and environmental implications. In order to manage growth successfully London will require a significant programme of infrastructure investment, alongside innovative approaches to infrastructure and development that will allow us to be more efficient, particularly in the context of reduced availability of funding and natural resource constraints.
2. Growth is in many respects a reflection of London's success – a testament to its productivity and competitiveness, the positive international perception of London and its status as a global city. People want to live and work in London, and businesses want to invest here, recognising the opportunities London provides. But unfortunately growth brings challenges and distortions – particularly to the housing market and also in terms of infrastructure capacity. In order to sustain London's position as a top tier leading city in the global economy, further investment in infrastructure is required to increase productivity and quality of life. Despite the challenges growth brings, research undertaken for the GLA suggests most Londoners are positive about growth. A recent telephone survey with 1,000 adult Londoners found that more than 60% of Londoners believe growth will benefit them; the challenge will be to ensure this is the case¹.
3. Ensuring London meets its infrastructure challenges is not just an issue for London, but indeed the rest of the UK due to the significant contribution London makes to the UK economy. Output per worker is significantly higher in London relative to other UK cities, with London's GVA per hour standing at £38.80 in 2013 rising to £42.80 in Inner London, compared to £31.10 for the rest of the UK². London also makes a significant net contribution to the national exchequer
4. A skilled workforce combined with a comprehensive transport system enables this higher level of productivity, allowing for agglomeration benefits and a competitive clustering of jobs, business and economic activity. Despite recent investment, we know that London's transport network is undermining productivity due to capacity constraints – even after accounting for Crossrail 1, and house prices are serving as a disincentive to locate in the capital for many workers. London's rate of productivity growth lags rival global cities such as Paris and Madrid.
5. Research undertaken by GLA Economics found that other parts of the UK benefit from proximity to London due to spillover effects, and as such maintaining productivity in London is essential to ensuring the on-going growth of the UK economy. Efforts to rebalance the economy should not be at London's expense; rather they should be in tandem with investment in the capital.

Work undertaken to date: The London Infrastructure Plan 2050

6. In 2014 the Mayor published the London Infrastructure Plan 2050 (LIP2050) to ensure that London has the infrastructure it needs to remain one of the best cities in the world in which to

¹ Telephone survey with 1000 adult Londoners in March 2015

² GLA Economics, 2015, 'Productivity in London'.

live, work and do business. The LIP2050 sets out a series of expectations regarding the delivery of infrastructure in the 21st century – digitally connected, green, integrated, innovative, and understood as a system of systems. The LIP2050 acts as an evidence base for an on-going, strategic conversation about London’s future infrastructure requirements, and has strong potential to inform the development of a new National Infrastructure Plan. It will also inform the mayor’s statutory strategies which will require revision following the Mayoral election in May 2016 – these include the London Plan (the overarching strategy for the capital and London’s spatial development plan), Economic Development, Transport and Environmental strategies.

7. In view of environmental and fiscal constraints our analysis found that London as a city needs to operate more efficiently and sustainably in order to meet its future infrastructure requirements. Investment in the context of growth should be targeted at improving productivity, increasing resilience and promoting sustainability.
8. In the recent past, the Mayor has focused on leveraging infrastructure investment to unlock housing development (and to obtain financing for infrastructure from development, as was done with the Northern Line extension – an innovative model which can be imitated elsewhere). However, in the longer term, the expectation will be that investments in new infrastructure will be made in tandem with smarter land use, improved planning and coordination of infrastructure relative to development.

Other elements of the London Infrastructure Plan

9. London’s infrastructure requirements beyond transport are significant, and at the heart of these requirements is housing. Increasing housing supply is the number one challenge facing London as a city. The London Plan sets out a target to build 49,000 homes a year to meet historical and arising housing demand. Such a number requires a near doubling of current output, to a level of supply not seen since the 1930s. Infrastructure, (particularly transport infrastructure) is one of the key levers available to unlock sites for housing development throughout London. As a case in point, the impact of Crossrail’s arrival in 2018 can already be seen, with more than two fifths of planning applications within a kilometre of a Crossrail station citing the new railway as a justification for the development proceeding – equating to around 53 million square feet of residential, commercial and retail space.
10. Infrastructure has the ability to make sites viable for development, and as such it is important that it is planned, delivered and coordinated with this in mind. There is also a need for the public sector to be more active in capturing the value generated by infrastructure investment, as this will allow for further investments, and provide a funding source.

Utilities

11. Housing and transport are not the only areas for further infrastructure investment. In order to ensure sustainable growth outcomes, attention also needs to be given to the key utilities which underpin the effective functioning of London, including water, digital connectivity and energy. Ensuring delivery of these required services is complicated by the fact that the Mayor does not have strategic authority over these areas, even though the Mayor is required to set the overall development strategies for the city.

Water

12. A growing challenge for London, with key issues relating to water security, flood risk and water quality needing to be addressed. Estimates put forward as part of the LIP2050 work identified an emerging supply and demand gap reaching 10 per cent by 2025, and this could be exacerbated by issues such as a failure to address leakages or encourage more sustainable rates

of consumption. The GLA is working with London's water companies and Ofwat to address some of these challenges; however as part of later stages of the work of the National Infrastructure Commission it will be important to identify how these challenges can be collectively managed in a cost effective but responsible way.

Digital infrastructure

13. This should be viewed as a utility. Provision of high speed, ubiquitous access to the internet is essential to the effective operation of a global city such as London, particularly from an economic perspective due to London's deep economic specialisations in finance, creative and digital services. The continued existence of 'not spots' both for residents and businesses across the city, including in its economic centre, suggests that the market is not operating effectively; such obvious market failures require much stronger intervention by the Government, with suitable state aid exemptions negotiated from the European Commission as necessary.

Energy

14. London's energy infrastructure needs to be developed in the most cost effective and sustainable way, with a focus on ensuring security of supply and meeting future demand. The LIP 2050 identified a 20% increase in energy demand can be expected by 2050 (after measures to reduce demand). To respond to this, government must double investment to ensure enough zero carbon energy is supplied to the national grid. We also need to ensure sufficient investment ahead of demand to unlock development sites. One in five of London's substations has less than 2MW spare capacity, however a large commercial development in London can use 8MW – and as such lead times are increasing to get connected. In order to address such issues a stronger policy of allowing investment ahead of need in the electricity infrastructure system is required.
15. Energy efficiency is vital to meeting the UK's climate change targets, and is one of the most cost effective means of reducing CO2 emissions. In tandem with efforts to address supply, such demand-side approaches should be considered as part of the work the National Infrastructure Commission is undertaking. A particular focus of this work should be on addressing the efficiency of London's existing building stock. London has some of the oldest and most energy inefficient building stock in Europe and it is expected that 80% of these buildings will still be standing in 2050. There is a need to retrofit this building stock through means such as insulation to reduce levels of energy consumption. London is already pursuing a number of programmes to address this issue, including the successful retrofit programmes RE:NEW and RE:FIT. Over 113,000 homes and 450 public sector buildings have been retrofitted as part of a Greater London Authority programme with more projects in the pipeline.
16. The inclusion of energy efficiency as a national infrastructure priority is supported by a wide range of stakeholders and businesses, including by the CBI. I hope that you will give consideration to this issue and that London can play its role in delivery an energy efficiency infrastructure programme.

Costing London's infrastructure requirements

17. Work in developing the LIP2050 was underpinned by a comprehensive cost model developed by Arup, which will continue to evolve to reflect changing priorities and assist with prioritisation and spatial planning. The analysis attempted for the first time to understand the magnitude of the full costs of London's infrastructure needs, including that of maintaining or replacing much of the existing asset base.

18. The headline figure from the Arup report is that total required investment in London's infrastructure between 2016 and 2050 will reach £1.3 trillion. Our projections show that London will need to increase its level of expenditure relative to GVA output by some 1.5% to meet its growing infrastructure requirements through to 2050, with costs doubling as a proportion of the economy over the next decade, but declining as a percentage of the economy after 2030.
19. While these estimates are based on an ambitious, policy-compliant scenario (including meeting our housing targets, decarbonising the electricity supply, and securing the necessary investment in transport), they indicate the scale of investment required, and are perhaps not unexpected given the resumption of net population growth after 75 years of no net growth at all.. Housing and transport make up over three quarters of total projected capital expenditure.

Delivering London's infrastructure

20. Work on the Infrastructure Plan highlighted a number of institutional barriers affecting the delivery of London's infrastructure, including split governance across and within sectors, varied regulation and lack of coordination. My setting up of the London Infrastructure Delivery Board was one response to these issues. It is made up of key infrastructure stakeholders in London, including the utilities across the infrastructure sectors (energy, water, digital etc.), as well as business, boroughs, regulators and Government representatives.
21. Some of its recent initiatives have included developing the London Infrastructure Database and Mapping Application, which aims to bring together information from a range of sources to support the planning, joined-up delivery and coordination of infrastructure across the capital. The mapping application identifies planned investments relative to growth and infrastructure capacity – and it provides a strong evidence base to inform future discussions around London's future infrastructure requirements on a spatial level. Other areas of focus of the Delivery Board have included testing best practice delivery in growth areas; and also advocating regulatory reform.

Regulatory challenges

22. The need for regulatory reform to support infrastructure investment is clear. The Mayor is concerned that regulatory frameworks are inhibiting development, innovation and higher levels of efficiencies. Much of London's infrastructure – water, energy, digital; is in the hands of the regulated utilities. The regulations in place successfully protect consumers from unnecessary price rises; however there are some unintended consequences. These include the fact that the Mayor has no direct influence over investment decisions, despite being elected to have strategic oversight of planning in the capital. The London Plan is not a statutory consideration as part of the process of approving business plans by the regulators.
23. In addition, regulations do not support appropriate levels of investment ahead of demand at particular locations where growth is expected to occur (and is occurring). Increased flexibility or new models of delivery are required to secure earlier investment on a more strategic basis. The GLA is committed to working with the regulators to address these issues through bodies like the UK Regulators Network.
24. In view of these issues the GLA is therefore keen to ensure that regulators require the utility providers to have regard, in particular, to the London Plan and its economic and demographic forecasts; that they require utility providers to share their plans as they develop; that they adopt more of a rolling forward planning approach (rather than fixed terms); that they take a much longer term horizon in key sectors like water and energy; that they allow for more investment ahead of demand, with a risk and reward sharing model, so that infrastructure is in

place before development comes rather than afterwards; that they encourage much more open data and sharing of data, including of future activity (via the mapping application above); and that they incentivise innovation.

Funding and financing London's infrastructure requirements

25. When developing the LIP2050, our original estimates of London's infrastructure needs were based on a number of ambitious policy scenarios, including aviation. The Plan determined that the cost of London's future infrastructure requirements are high and a significant funding gap of £135 billion is likely to emerge by 2050 when comparing expected costs against current sources of revenue.
26. To meet this challenge the Mayor has argued for fiscal devolution in order to help London better meet its funding gap. If London controlled more of the tax revenues it generates, it would be better positioned to incentivise growth and address its unique infrastructure challenges. The recent announcement by the Chancellor promising to devolve business rates is an important step forward (and welcomed), but it still is not enough to meet London's future funding challenges. More needs to be done to devolve the full suite of property taxes raised in London as recommended by the London Finance Commission, and enable new local funding mechanisms.
27. New forms of fiscal devolution to better capture value and create self-funding infrastructure schemes such as stamp duty increment zones, VED devolution should be prioritised. Increased devolution would ensure that larger infrastructure schemes could be realised faster through new or increased use of alternative funding mechanisms, such as business rate supplements, tax increment financing and enterprise zones. We have demonstrated successfully through the Northern Line extension and Crossrail the applicability of such funding mechanisms in the London context.
28. Longer term fiscal opportunities may include. London or wider South East payroll taxes or income tax supplements (either in lieu of tax cuts or additional) hypothecated for investment. A recent survey of Londoners found that around 60% of Londoners were willing to pay more income tax by giving up part of a tax cut in return for increased infrastructure investment³. Wales and Scotland, much smaller economies, have such powers on a much greater scale – as do many other cities and regional economies worldwide. London is much more reliant upon national decision making and national spending transfers than comparable cities: for example 74% of GLA and borough expenditure is funded from intergovernmental transfers, compared to equivalent figures of 31% in New York and 18% in Paris⁴.
29. These approaches provide London with increased capacity to address its own needs – enabling new financing and funding mechanisms and improved accountability. It will also remove a layer of the political process in realising infrastructure in the capital, speeding up delivery and approval. Without the funding levers to invest appropriately, the mayor's capacity to invest in infrastructure will be severely constrained.

³ Mayor of London, July 2015 – telephone poll of Londoners

⁴ London First, 2015 'London 2036: an agenda for jobs and growth'.

Greengauge 21 consultation response to National Infrastructure Commission: London's Transport Infrastructure

Greengauge 21 welcomes the opportunity to respond to the National Infrastructure Commission call for evidence.

In the first part of our response, we explain why a strategic framework, currently lacking, is needed to consider investments such as Crossrail 2. We put forward common criteria that we believe should be considered in all major (transport) investment decisions. The second part responds to the specific issues raised in the London's Transport Infrastructure consultation.

(i) The need for a strategic planning framework

The Northern and London transport initiatives are being considered by the NIC against a backdrop of continuing high annual rail demand growth and of major investments in the rail sector (and a substantial highways investment programme too). It is clear that substantial further investment will be necessary.

Our contention is that there is (still) no overall strategic plan or vision for the development of the national rail network. The risk is of failure to plan effectively the many interfaces and potential overlaps between projects, with the attendant dangers such as wasteful or even nugatory expenditure; untenable levels of disruption to services and local communities; and spikes in demand for the supply chain. Crossrail 2 would benefit from a wider rail strategic plan for London and the wider South East.

We recognise the planning work that Government (through DfT), Network Rail and the ORR undertakes to establish 5-year investment programmes for rail. But there is no longer term strategy.

We believe that there needs to be a *rationale* for new project possibilities set at a national level to help form the narrative on the need for such schemes, and to complement the business cases that project promoters (*e.g.* TfL and TfN) will be developing. Under EU law, while the recent precedent with HS2 may suggest otherwise, there is possibly a legal need for a strategic environmental assessment, and the wider strategy we call for could address this need or agenda.

Greengauge 21, through its Public Interest Group formed in 2008, with sponsorship of the English RDAs, Network Rail, TfL and many other public authorities across Britain, created a national strategy for high-speed rail ('Fast Forward', published in September 2009).

With appropriate support from stakeholders, building on its experience with high-speed rail, Greengauge 21 is seeking to develop during 2016 a broader *national rail development strategy*. This will include consideration of high-speed rail, but look more widely, at all forms of rail operation, passenger and freight. It will also consider the important interface between the national network and city region metro systems – a neglected area of study and one which is of particular relevance to Crossrail-style projects – projects which, in general, we believe are a highly effective way of developing the rail network. We would welcome exploring how it can be used to serve the National Infrastructure Commission objectives going forward.

In that work, we plan to develop clear criteria applicable across the nation when considering major rail investment options. We have identified five criteria that we believe the Commission should apply to the Northern and London cases – and indeed to all future transport investments of significant scale. These are:

1. Regional (and city region) economic need
2. Housing growth need
3. Capacity need
4. Implementation sustainability
5. Compatibility (with other projects and with changed circumstances) and sequencing.

The first criterion – regional (and city region) economic need – is straight-forward: there must be spatial plans. London, uniquely, has such a plan for 2050, provided under its statutory obligation from the Greater London Act.

Greengauge 21 considers it is essential that London's plans are kept up-to-date, developed comprehensively, with private sector inputs, so that a contemporary account of economic development outlook is available at all times. Otherwise, transport (and no doubt other) investment can only be considered in a vacuum.

Crossrail One was, in our judgement, ultimately given Government approval to proceed because of the existence of a clear long term expectation on the scale and location of the capital's future population and employment growth. Without wider

plans or frameworks, transport investments risk being distorted towards meeting existing/short term/foreseeable transport network congestion issues or other shortcomings: the investments may still be worthwhile, but they are unlikely to be transformational and will leave open to chance whether wider economic and housing policy objectives are met as fully as they could be.

The existence of long term, spatially defined, growth plans in the London case goes a significant way towards meeting the second criterion (housing growth need). But it also serves to highlight the problem in the surrounding shire counties, where previous regionally-set housing growth targets have been squandered. Planning Crossrail 2, for example, which is said to 'connect Surrey with Hertfordshire', is hindered by the lack of longer term quantified and spatially-based plans for these counties. Greengauge 21 urges the Commission to call for this lack to be made good. The Commission is well-placed to consider questions like overheating of the housing market in London/Southeast (and the apparent lack of demand across much of the North).

The third criterion – capacity – needs to be driven by a range of demand growth scenarios which include a continuation of recent trends as well as the lower, more cautious forecasts used by DfT.

Consideration needs to be given to *what if* scenarios, rather than a single central demand forecast (including the effects of policy or technology shifts; funding availability and implementation slippages; market trend inflections). This should include thinking about *flexibilities* with operating pattern assumptions and hence wider outcomes.

There is a particular gap presently in the area of freight forecasts where major revisions are needed to take into account the possible impacts of port developments – especially Thames Gateway – and the emerging markets for rail in meeting domestic logistics and distribution network needs, including into urban centres.

And when considering capacity, the closely related area of punctuality performance needs to be addressed as well. There are often non-infrastructure solutions to capacity problems that are appealing for cost reasons but leave the network – which is already busy – overloaded and subject to poor punctuality performance.

The fourth criterion – implementation sustainability – is intended to help guide the nature or version of specific interventions and projects, applicable on a consistent basis across the nation. It has three distinct components:

- The ability of the region/corridor served to sustain any adverse environmental impacts, and specifically, the loss of land currently not used for transport;
- The likely impact on land use development, summarised on a single dimension of inducement towards densification/intensification of existing developed/formerly developed ('brownfield') land at one end of the axis and new development ('greenfield') and dispersion/sprawl at the other end; this is a key indicator for wider carbon/energy outcomes;
- The ability of the region's/corridor/s transport system to sustain economic objectives during periods of disruptive construction.

In effect, work in this area should help guide the type of investment needed: whether it would be better to upgrade existing or to go for new build; to serve existing urban developments or foster and encourage new settlements; to propose new transport infrastructure at-grade or in tunnel, and so on.

The fifth criterion – compatibility and sequencing is often missing from project-specific appraisals and gateway reviews. Applicable at project level, a compatibility matrix for Crossrail 2 covering rail investments is shown below. There is a high level of complementarity, with some other projects representing real opportunities for integrated designs and cost savings – in particular, the planned upgrades for the South West, Brighton and East Coast Main Lines as well as the possible DLR extension from Bank to Euston and plans to connect Stansted better with central London (which could be achieved with a Lea Valley upgrade scheme or with a totally new alignment – the latter having the potential to address wider issues such as ECML capacity).

Many projects are complementary and some would feed traffic onto Crossrail 2. Long term plans to increase tube line capacity (e.g. the Piccadilly Line) may, on the other hand, have an adverse impact on the business case of Crossrail 2 and the Thameslink project and other plans to improve Stansted connections could substitute in part for Crossrail 2 (but equally, with care, could act as good complements too).

Other project interfaces we judge most likely to be overlooked that represent real opportunities that could be precluded (or made costlier) by Crossrail 2 implementation include the outline plans for an outer London orbital railway in the London 2050 Plan (the scheme shown uses the same railway between New Malden and Teddington as Crossrail 2), and the DLR extension to Euston where an integrated station design could bring wider benefits to both projects.

Crossrail 2 Compatibility Matrix

COMPLEMENTARITY				PROJECT	OVERLAP	
Integrated design opportunity = ££ saving	One project feeds the other	Precursor project, builds market for Crossrail 2	Independent		Partial substitute, so business case impact	Clear alternative
▪		▪		SW Main Line Upgrade	▪	
▪				Brighton ML Upgrade		
▪				ECML Upgrade		
			▪	GEML Upgrade		
▪	▪			DLR Euston Ext		
				Tube capacity	▪	
			▪	Northern Line Ext		
			▪	Croydon Tramlink devt		
	▪			London 2050 plan orbital rail		
	▪			LHR southern access		
	▪			HS2		
▪				Stansted Express & Lea Valley scheme		▪
▪			▪	Crossrail 1 Extensions		
				Thameslink	▪	

The related question of sequencing is not the same as phasing. It concerns questions of what actions/investments are precursors for others and what might be precluded subsequently by early decisions, as well as optimum timings. It is crucial to thinking about strategic fit and meeting one of the criteria that Sir David Higgins identified for HS2: standing the test of time.

(ii) London's Transport Infrastructure

Developing London's transport infrastructure has involved lengthy timescales, and in some cases policy reversals: the abandonment of the 'Northern Heights' underground line extensions in the 1940s and the partial implementation of the London ring motorway schemes in the 1973 Greater London Development Plan before their abandonment serve as lasting examples.

Lengthy planning timescales allowed schemes such as the Victoria Line (1960s) to be designed to achieve key customer benefits such as the cross-platform interchange between the Victoria and Bakerloo lines at Oxford Circus. Subsequent tube developments have been less satisfactory, requiring level changes for transferring passengers at interchanges that have become much costlier to construct.

For rail, there have been broadly three types of development:

- Those initiated by London Transport/TfL – and the seminal (but very rapidly carried out) Central London Rail Study of 1988 (the clue to much of what followed in terms of the specification of Crossrails 1 and 2 is in the word *central*)
- Projects designed to get more out of existing infrastructure, and London underground has now built an excellent track record in increasing capacity with higher service frequencies, alongside station by station measures to increase access/interchange flow capacities; also in this category would be the London Overground
- Other rail developments not initiated by London Transport/TfL – and these have included the DLR, Croydon Tramlink, the Croyley Link (now re-labelled the Metropolitan Line Extension). Interestingly, these are schemes largely outside central London. The Jubilee Line and Northern Line Extensions were both initiated by property developers. But all of these projects have ended up under TfL's overall management (including in most cases through the construction phase).

There has been no successor to the Central London Rail Study carried out 27 years ago, nor any comprehensive plan for developing London's rail network across inner and outer London. So there is a planning vacuum around Crossrail 2.

The sequence of events with Crossrail 1 implementation is relevant. It had been selected as the priority from the various Central London Rail Study (CLRS) schemes

but its Parliamentary Bill was thrown out in 1994. A subsequent study led by the Strategic Rail Authority in 2001 examined the need for investment (The London East West Study (LEWS)), and this studied a wide range of options and considered the needs of freight traffic, for example, as well as passengers. No equivalent study has been carried out for Crossrail 2; its selection is based on the now ancient CLRS study, where it came in second. Crossrail 1 was revised following LEWS to include an alignment serving Whitechapel and Canary Wharf – and the earlier objections from London Borough of Tower Hamlets that had stopped the 1994 Bill did not recur.

In terms of the road network, there has been a continuing erosion of network capacity for vehicles attributable to local demand management measures, and better provision for cycling and pedestrians. Vehicular travel speeds have declined in all parts of London over the last ten years as a result, even with static and slightly falling traffic volumes.

The review led by Deputy Mayor Isabel Dedring in 2013 identified the potential role of tunnelled roads and a possible inner ring scheme was published in May 2014¹. Because of the high levels of suppressed demand, any increases in road network capability for vehicular traffic will be self-defeating as a means to tackle road congestion; road user charges or tolls would need to be considered; price levels would have to be punitive. In short, it is not realistic to plan on expanding the road network to add general vehicular traffic capacity. On the other hand, there is strong demand for additional space to be set aside as public realm; there is a very critical need to achieve gains in air quality (so pedestrianisation of Oxford Street should be a priority, especially given the access gains that Crossrail 1 brings²); and there is a need to accommodate buses, service vehicles and emergency services with a much reduced risk of delay from congestion.

This suggests that tunnelled road schemes with these wider user objectives should be developed – but explicitly not as a means to increase general road traffic capacity.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The problems of success – a prospering city, with economic strengths not just in financial/business/professional services, but also in creative/digital media and culture, in tourism, retail, in Government, in law/justice, in research and learning.

¹ <https://tfl.gov.uk/corporate/publications-and-reports/roads-task-force>

² See West End Commission, final report April 2013 www.westendcommission.com/Report.html

With high population growth, in both London and the surrounding regions (Southeast and East of England), there are challenges to provide sufficient new housing and associated social infrastructure (schools, parks/leisure facilities, hospitals) at affordable prices.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Road investment needs to be directed towards meeting the needs of many distinct user groups: pedestrians, cyclists, buses/trams, servicing vehicles (including to construction sites) and emergency vehicles.

Rail investment needs to address the capacity challenges identified by Network Rail, including on several major radial lines³; efficiently to cross-link radial lines; to create a limited set of orbital rail routes that convert the radial routes into a part of a broader network capability; to respond to major development opportunities as they arise in the manner of JLE and NLE; to continue the programme of station capacity enhancement and LU line capacity upgrades; to respond to the access needs of major long distance terminals (HSR and airports); to provide for cross London railfreight and railfreight terminals.

- *How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?*

Against the 5 criteria identified above and by reference to business case and benefit:cost performance.

- *What might their potential impact be on employment, productivity and housing supply in London and the southeast?*

These investments are hugely important to employment and productivity. They might have little useful impact on housing supply/prices: transport enhancement tends to drive up property values and hence prices. But planned in conjunction with new measures to achieve residential densification and to serve large scale new

³ London and South East Route Utilisation Study 2011 see [www.networkrail.co.uk/.../route%20Utilisation%20strategies/.../london%](http://www.networkrail.co.uk/.../route%20Utilisation%20strategies/.../london%20) and www.networkrail.co.uk/...studies/london-and-south-east-market-study.pdf of 2013.

developments with 'transit-oriented development', rail investments could be made supportive of the housing supply objective too.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The *benefits* of Crossrail 2 can be increased by:

1. Ensuring it provides sufficient capacity relief to major national rail routes so that other parallel major rail investments are not needed
2. Cross-linking its branches, such as Kingston – Epsom (which will otherwise be under-utilised with perhaps only 4 trains/h) to provide part of the orbital network (and failing to do this may well preclude creating a highly valuable orbital rail system)
3. Increasing planned service frequencies to 40 trains/h. This requires full automation, but this is the norm with new metro systems.

To expand on the first point. Crossrail 2, suitably adapted, could provide for transformations of the South West and East Coast Main Lines (SWML and ECML). The four track route into Waterloo (SWML) has sufficient demand (peak passengers routinely stand for over 60 miles) to require one pair of tracks to offer a non-stop route into Waterloo, with the other pair of tracks accommodating limited stop outer suburban services to provide high frequency interchange at the key nodes along the route in London (Wimbledon, Clapham Junction and Vauxhall). The current Crossrail 2 plan will unfortunately preclude this by leaving a need also to serve Earlsfield – a location that needs to be served by Crossrail 2 running on its own tracks. It would still be possible to serve Balham and relieve the Northern Line, but this should be a separate branch, suitably extended to serve the Streatham area.

At the other end of the route, the ECML will be paralleled by Crossrail 2, but not over sufficient distance to obviate the need to operate duplicate suburban services, wasting line capacity and precluding the expansion of longer distance (and high-speed services) on the ECML corridor without building a new pair of tracks (in the style of the HS2 approach to central London). Crossrail 2 should be extended (on its own tracks) to Welwyn Garden City accordingly. A second branch should run eastwards to serve the opportunity areas along the Thames.

Costs can be reduced by adopting technology closer to that used on DLR, allowing where needed, for greater flexibility of alignment, and with 40 trains/h, potentially somewhat shorter trains and therefore lower cost stations (a combination that also

reduces the risk of station overcrowding and the need to provide for it). Unnecessary or unwanted stations (such as at Chelsea) can be avoided and faster journey times and shorter (lower cost) alignments can be selected (at least in this instance).

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- *What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?*
- *What innovative funding mechanisms could be considered to support delivery of key schemes?*

A levy should be placed on all property in London, residential and business, to fund transport investment. Together this should provide at least 33% of the funding of projects like Crossrail 2 – with extensions into the line catchments in surrounding shire counties. Another third should come from operating profit (that is revenues less operating costs). Ticket prices will have to remain high – partly because of demand management issues – but more discounting should be available to younger residents who cannot afford the fares, from 18 to 25/30 and maybe even 40 years age groups. Government should fund the balancing third: its returns will be huge (including in enhanced tax revenues).

For road schemes, the Congestion Charge needs to be overhauled and extended to the M25. In London the road system is the one transport network which does not cover its routine costs. Use of the network by the innovative forms of service providers such as Uber and car clubs needs to be addressed separately from the regular pay-as-you go/daily tariff.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

A useful source on this subject is now a little out of date but remains reasonably comprehensive.⁴ Some cities (e.g. Oslo) have since used road tolling to fund public transport schemes.

⁴ Transport 2000 (now CBT): Financing Public Transport: How does Britain Compare? 1992

Response to the National Infrastructure Commission Call for Evidence on London's transport needs from the Royal Borough of Greenwich Conservative Council Group

January 2016

1. Executive summary

- 1.1. The Greenwich Conservative Council Group welcomes this opportunity to contribute evidence to the National Infrastructure Commission's Call for Evidence on London's transport needs.
- 1.2. We have responded to the questions laid out in the call for evidence from our perspective as a Group of (opposition) councillors representing residents in the Royal Borough of Greenwich. Our response naturally focuses on South East London.
- 1.3. Any queries about this response should be directed to Councillor Matt Clare, Greenwich Conservatives Transport Spokesperson at [email redacted]

2. Question (1): What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

- 2.1. Over the next 10 years alone 80,000 new homes will be built in the 5 most South Easterly London boroughs.
- 2.2. Large-scale building will continue beyond the current 10 year targets of 80,000 new homes. Moreover significant home building is underway further out from London on already crowded commuter routes which are shared by residents of the five South East London boroughs.
- 2.3. With efforts to shift commuters from car to public transport the already overcrowded Southeastern trains commuter routes from Kent via South East London will not cope with increased passenger volumes unless significant capacity is added and alternatives such as cycling and buses maximised.

Road capacity in Southeast London is considerably less than in North London and already overcrowded. The Silvertown tunnel, of which we are supportive in principle, will go some way to address this. However clearly the roads are at capacity with there being no option to build further. This further reinforces the arguments in favour of significant improvements to public transport in South East London.

3. Question (2): What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

3.1. **The Bakerloo Line extension from Elephant & Castle to New Cross Gate, Lewisham and onward to Catford & Hayes via an existing National Rail line is essential** to help address the challenges described above.

3.2. The Bakerloo line extension will provide

- an additional high frequency public transport route from very high population growth areas such as Catford, Lewisham and the Old Kent Road to Central London
- a freeing up of line capacity on already overcrowded regional train routes from Dartford via Sidcup and Bexleyheath as well as from Orpington on the Lewisham to London terminii stretch
- a high frequency 'turn up and go' tube service to central London from Hayes, Catford and beyond to replace infrequent trains

3.3. The Bakerloo line extension will also deliver excellent value for money. At approx £2.5bn the proposed Bakerloo Line extension represents only around 15% of the cost of Crossrail 2, but will serve heavily populated relatively central London areas not currently on the tube/train at all (e.g Old Kent Road, Camberwell)

3.4. It is worth noting that this extension was first considered in the 1930s and again in the 1950s and 1970s, long before the volumes of traffic and commuting by train we see today. Due to its currently very central terminus the Bakerloo line is seemingly the only rail line in London which has the capacity to cope with an extension like that proposed above.

3.5. **We also support the proposed London Overground extension from Barking Riverside to Abbey Wood.**

3.6. The London Overground is being extended from Barking to Barking Riverside. Continuing south eastwards to include Thamesmead and Abbey Wood would

bring significant further employment opportunities to residents on both sides of the river.

- 3.7. It is worth noting that with its 50,000 residents Thamesmead is the largest area of London to not be served by tube or rail at all.
- 3.8. **We believe that cycling infrastructure must see significant investment in South East London.**
- 3.9. South East London remains under served by public transport compared to other parts of London. Unfortunately commuting by bike is not yet as attractive an option in South East London as it is from other areas of London which are a comparable distance from the centre such as Newham, Wandsworth or Merton. This is largely due to a lack of safe segregated cycling routes.
- 3.10. The Old Kent Road, Central Lewisham and Lee High Road in particular are considered dangerous and a barrier to many people commuting to work on a bike.
- 3.11. The approved CS4 and CS5 routes will go along way to achieving this. However further extensions outwards should be considered (for example, to Plumstead and Eltham) as well as additional alternative routes. These should only continue with the consent of residents, including all types of road users, and so proper consultation with the public is essential.
- 3.12. **Crucially, the highly successful TfL/Santander Cycle Hire Scheme must be extended into South East London** in the same way that it has been to East, West and South West London all of which already enjoy far better public transport connections.
- 3.13. Extending TfL cycle hire into South East London will give more resilience to the transport network and reduce reliance on cars and buses for shorter journeys.
- 3.14. Greenwich Conservatives are already campaigning for an expansion of TfL cycle hire into Greenwich via the foot tunnels from Island Gardens, including lobbying the Labour administration of Greenwich Council to make a pro-active case to Transport for London, which it has so far failed to do.
- 3.15. It is estimated that a few docking stations could be delivered for around the cost of a brand-new double-decker bus. Contrast this with that bus which travels from point A to point B via predetermined stops and is only available at the point the bus finds itself on that route at any one time. Investing in Santander cycles gives docking stations and bikes which are available at scattered points and can be ridden at flexible times to any one of 750 docking points across London.

4. (Question 3): How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

4.1. Given the already overcrowded and inadequate public transport in South East London (See PTAL ratings) we strongly believe that the Bakerloo line extension must be prioritised. The Bakerloo line extension can be delivered for only around 15% of the cost of Crossrail 2.

5. (Question 4): What might their potential impact be on employment, productivity and housing supply in London and the southeast?

5.1. Each of the above three projects will bring residents of South East London (old and new) within reach of more employment opportunities.

5.2. Faster, more reliable train and tube journeys into central London will be key to London remaining productive. Already with current volumes of commuters Southeastern trains are frequently delayed resulting in regular productivity losses for London businesses.

Eurotunnel submission to the National Infrastructure Commission consultation – London

Eurotunnel welcomes the opportunity to respond to this consultation, having long been aware of the need to ensure that infrastructure projects in the UK are delivered rapidly in order to support economic growth.

Overview

Groupe Eurotunnel (GET) manages and operates the Channel Tunnel Fixed Link between Britain and France, providing the infrastructure for Eurotunnel's own Shuttle services, international freight and high speed passenger trains. Completed in 1994, the Tunnel was financed entirely from private sources at no cost to the taxpayer.

GET also operates GB Railfreight, as the British arm of its Europorte rail freight brand. Acquired by Europorte in 2010, the business operates a variety of services including bulk traffic, biomass, coal steel, petrochemicals and metals transportation. GB Railfreight prides itself on its innovative approach to railfreight which has seen it win a number of rail industry awards and earn the standing as Britain's most reliable freight operator.

Maintaining effective transport links throughout the UK is crucial to ensuring economic prosperity. This allows businesses in London to transport their products throughout Britain and beyond, and also ensures that the Capital is supplied with the goods it requires.

Response

As the operator of the Channel Tunnel, GET provides crucial infrastructure for the transport of goods to and from mainland Europe. The opening of the Channel Tunnel revolutionised the UK's accessibility to the European market, which can be reached faster and more reliably than at any time.

The UK economy directly benefits from the mature fixed link to mainland Europe. Key industry sectors have built import and export business models that are only viable because of the Tunnel. For example the automotive industry can transport time sensitive components; fish from Scotland and meat from Ireland can build key export markets across Europe. Prior to the Tunnel there was no economically sustainable business model to facilitate the UK's full participation in this trading revolution.

To support London's growth through more effective access to European markets, additional highways capacity crossing the Thames to the east of London is required. This can be delivered through the proposed Lower Thames Crossing which will support economic growth and release pressure on central London crossings such as the Blackwall Tunnel. In addition, new capacity for rail freight is required through Kent, to link businesses in London to the continental market, as set out below.

South East road highways capacity and Operation Stack

However, this summer saw access to the Tunnel limited by a combination of migrant incursions and striking ferry workers. Operation Stack was enforced for 28 days and during this time British manufacturers all over the country were placed under intense pressure. The goods transferred via the Tunnel tend to be high value components for the automotive, electronics, pharmaceutical industries, fresh produce and rapid courier services, and delays in their transportation result in large costs for business throughout the UK.

Although Operation Stack has not been in force since then, the events of the summer highlighted the need to increase the resilience of road networks in the South East. The road network in Kent is vital for connecting the south of England to the Capital. With a predicted increase in truck traffic of 30% in the next five years, there is a clear need for a solution to Operation Stack and additional capacity in Kent and the South East road network. In order to maximise economic growth across the country we must keep vehicles moving. This requires long term solutions such as: adding capacity to the M20; upgrading the A2 to motorway standard; providing additional capacity across the Thames through a new Lower Thames Crossing (as noted below); and consideration of modal shift to rail freight. These changes would ensure that products made throughout the UK are more likely to be successfully transported to Europe, than the current situation where Operation Stack is enforced.

This requires long term solutions such as adding capacity to the M20, upgrading the A2 to motorway standard and also consideration of modal shift to rail freight. These changes would ensure that products made in London can be successfully transported to Europe without costly delays, and businesses in London will receive the products they need to serve their customers.

Rail freight capacity

Another opportunity for addressing congestion on the roads in the South East and to ensure greater security for time sensitive deliveries would be for the Government to invest in the creation of greater rail freight capacity across the UK.

This will encourage a modal shift from road to rail, taking lorries off the road network, releasing capacity for other vehicles and increasing the reliability of those companies using rail freight for deliveries. There would also be well-documented environmental benefits delivered by this modal shift.

The Government has committed to deliver additional freight capacity, but action needs to be taken, in particular:

- Implementing and funding the proposed European Rail Freight Corridor from Europe to London to ensure swift rail access to foreign markets.
- Completing the Kent Gauge Study proposed by Network Rail and upgrading freight routes through the county which link the Channel Tunnel to London and the wider UK.
- Investigating and delivering improvements to the network beyond London, so that businesses in the Midlands and North of England benefit from rapid rail freight access to European markets and routes to the Capital. This includes identifying and delivering capacity improvements on key rail arteries such as the West Coast and East Coast Main Lines.

Lower Thames Crossing

Finally, addressing capacity on crossings across the Thames through the creation of a Lower Thames Crossing is also crucial for ensuring prosperity. A new crossing would relieve congestion on the routes from the South East into London, allowing businesses to transport their produce in good time and smoothing traffic flows into the Channel Tunnel.

Upgrading the local Kent road network, increasing rail freight capacity, and constructing a Lower Thames Crossing would benefit London businesses by improving their ability to connect to mainland Europe and reducing delays which cause their products to lose value. Additionally, an improved road network would reinvigorate local development in the South East by creating jobs in the area, and stimulating investment as businesses become more confident that there is a reliable transportation network.

The Conservative Group
London Borough of Hammersmith & Fulham

Via email

5 January 2016

Dear Ms Dix,

Response to the Crossrail 2 consultation

As the Conservative Councillors for the London Borough of Hammersmith & Fulham, we are writing in support of a Crossrail 2 interchange at Imperial Wharf.

Last month, the TfL Commissioner, Mike Brown, assured Greg Hands MP that Imperial Wharf is “being seriously considered” as an alternative station site. This new approach is encouraging. We believe that Imperial Wharf would serve more commuters, support more new jobs and homes, offer better value and – perhaps as importantly – gain support across our borough and west Chelsea.

Imperial Wharf has significant advantages over the current plans for a station at the eastern end of the King’s Road:

Interchange – Imperial Wharf would form the main Crossrail 2 interchange with the West London Line, reducing journey times for passengers. Without a separate interchange, Clapham Junction is likely to face severe station capacity problems, because it will also handle new demand from dozens of mainline routes. The interchange would also remove pressure on Overground services at the existing Imperial Wharf station, while relieving pressure on the District Line at West Brompton, Fulham Broadway and Parson’s Green.

Passengers – based on its current catchment area alone, more commuters would use a Crossrail 2 station at Imperial Wharf. This number rises when new development is anticipated. It rises again when new bus routes in south Fulham are considered, as there would be substantial demand for improved links under Crossrail. When passengers transferring from the Overground are added, the commuter case for Imperial Wharf becomes overwhelming.

Alignment – a natural alignment from Imperial Wharf (through Clapham Junction) to Balham would not involve tight curves. Changing the orientation of the track through Clapham Junction would therefore result in faster journeys, an equivalent track length and lower maintenance costs than under the current plans. We also welcome TfL’s acknowledgement that the foundations of the riverfront buildings are navigable. There is no engineering barrier to a Crossrail 2 station at Imperial Wharf.

Cost – land values around Imperial Wharf are cheaper, with the ability to redevelop a brownfield site to offset the cost of the station. The Lots Road Car Pound site would allow a significant capital receipt from new housing, as well as a station entrance in Chelsea. There is also the possibility of s.106 contributions from neighbouring sites that are due for redevelopment. Together, these factors suggest a significantly lower cost for an Imperial Wharf interchange than building a King's Road station with no associated redevelopment.

Olympia – District Line services to Olympia have been a recurrent issue for residents, for the exhibition halls, and for solving the bottleneck at Earls Court. A Crossrail 2 interchange just two Overground stops away at Imperial Wharf would finally provide a solution, particularly when combined with more frequent Overground services. Likewise, Imperial Wharf would provide a real alternative for many more passengers at West Brompton, which faces growing pressure from new development.

Regeneration – a key aim of the Crossrail 2 project is to unlock more jobs and homes, assisting in London's regeneration. There are several major redevelopment sites around Imperial Wharf, all of which are poorly served in terms of public transport links to central London. This has hampered their progress. A Crossrail 2 interchange would spur substantial investment and create new employment around the station. By contrast, no significant development sites in Chelsea would be unlocked through the current plans.

Support – unlike the plans for a King's Road station, there is unequivocal local support for bringing Crossrail 2 to Imperial Wharf. It would benefit thousands of commuters in Fulham, both directly and by relieving pressure on the District Line. It would still benefit thousands of commuters in Chelsea, with greater benefits for the poorly connected areas around World's End and Lots Road. It would also offer benefits along the rest of the West London Line. Local residents consistently tell us that they want Crossrail 2 to serve our area.

An Imperial Wharf interchange is compatible with the original conception of a Chelsea-to-Hackney line, which for many years included safeguarded land in Fulham. It would allow a station entrance in Chelsea, on Lots Road, and others serving Chelsea Creek, Chelsea Harbour and Imperial Wharf. At the same time, it would enable Crossrail 2 to be cheaper, faster, serve more passengers and tackle overcrowding at multiple stations, while delivering the regeneration always intended.

Given these advantages, it was frustrating to see many inaccuracies and omissions in the report provided to Greg Hands MP in October. We hope that you will now commit to undertaking a proper technical study of the Imperial Wharf option, which will provide a credible basis for assessing passenger numbers, cost, regeneration potential, journey times, station alignments, tunnel routes, shaft locations, Overground usage and the impact on other stations and lines.

In administration, we urged the case for an Imperial Wharf interchange during TfL's consultation process in 2013. Given the new Commissioner's openness to rethinking the plans, we strongly urge the case again. It is a far better option than the King's Road.

We would welcome an opportunity to meet in person to discuss an Imperial Wharf station on behalf of our residents.

Yours sincerely,

Executive Summary

Heathrow Airport Limited congratulates the Chancellor on establishing a much needed and independent National Infrastructure Commission to provide unbiased assessments of the UK's long-term infrastructure needs. Heathrow also looks forward to the Commission's commitment to monitor the Government and industry's progress in meeting these needs, because it is critical national interests are not thwarted by local political interests.

As the European Commission noted in its recent Aviation Strategy, connectivity and infrastructure – and as Heathrow's submission will outline, strategic connectivity to airports – are critical to the UK because 'studies show that the better a city, region or country is connected by air to other destinations in Europe and other parts of the world, the more growth can be generated.' The European Commission's new Strategy also recognises aviation and airports as 'strong drivers of economic growth, jobs, trade and mobility for the European Union' and hence why improving connectivity has been listed as one of the Commission's three key priorities.

The fact that connectivity has been outlined as a priority in the European Commission's new Aviation Strategy also validates the important role connectivity and infrastructure play in the UK economy and why the independent National Infrastructure Commission's work is so important. The Commission should note that it is not just city-to-city connectivity that could address connectivity weaknesses, but also strategic city-to-airport connectivity.

For example, limited and indirect rail and air links between the North and Heathrow Airport are holding back the growth of northern city regions because 'the world's economic centre of gravity has shifted towards Asia.'¹ Heathrow offers more direct and frequent flights to Asia because it is a hub airport. As a hub, Heathrow is different to other UK airports, because it can pool international, continental, domestic and local demand for leisure and business passengers as well as air freight, making direct flights to more cities around the world, particularly emerging markets, more commercially viable for airlines. It is critical that northern cities are well connected to Asia and the most viable way to do this for the UK economy is with better connectivity to Heathrow Airport.

That said the UK's regional airports still play an important role in connecting regional city regions, but they play a different role to Heathrow. For example, this submission demonstrates how as a hub, Heathrow plays a significant and different role to other airports in the country's freight connectivity. Heathrow is the most important freight airport in the UK, moving more cargo than all other UK airports combined (CAA, UK Airport Freight Data, 1990 – 2014²). This confirms the importance of connectivity (rail and domestic air links) to Heathrow for exporters in the North and indeed around the country.

While the Commission is not looking at airport capacity, it is important that the Commission notes the added benefits to the UK and the freight community when prioritising infrastructure projects and the added benefits that connectivity can bring.

As mentioned previously, with the global shift to Asia, London – and the UK's – status and its continuing success as a global centre for business is critically dependent on the quality of its international connectivity, as well as its local transport infrastructure. London is expected to see major population growth, but it is in competition with other cities around the world, so investing in London's transport infrastructure and connectivity to its only hub airport is key to maintaining its competitive edge and status as a leading global city for its residents, businesses, international investors, exporters, students and tourists.

About Heathrow

Heathrow Airport Limited owns and runs Heathrow Airport – the UK’s only hub airport. In 2014 73.4 million passengers and 1.50 million tonnes of freight passed through the airport – worth £101bn in value, making Heathrow the UK’s biggest port by value.

Heathrow is one of the UK’s largest transport hubs with the UK’s only dedicated non-stop express airport rail link, free travel zone, the UK’s busiest bus and coach station and the only airport served by London Underground, with four stations. Over the last 20 years passenger numbers have risen by almost 80% and yet airport related road traffic has remained broadly static. The number of passengers using public transport every year has nearly doubled from 10 million to 19 million and the proportion of our colleagues driving to work alone has fallen from 8 in 10 to just 5 in 10.

Introduction

Heathrow is submitting evidence to the National Infrastructure Commission’s call for evidence because we believe there is opportunity for the Government to prioritise certain infrastructure projects, particularly rail and domestic air links to the UK’s only hub airport – Heathrow – to benefit passengers, businesses, the environment and the UK’s economy not only in the north, but also for the rest of the UK and Greater London.

While this call for evidence is not looking at airport capacity or air quality issues, **strategic and sustainable connectivity to airports** – particularly the UK’s only hub airport, Heathrow – are areas of infrastructure that we believe the Government should prioritise to improve all of the UK’s connectivity, economic growth and maintaining London’s status as a leading global city.

1. Connecting northern cities

1. *To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?*

Limited and indirect rail and air links between the North and Heathrow Airport are holding back the growth of northern city regions because ‘the world’s economic centre of gravity has shifted towards Asia.’³ Heathrow offers more direct and frequent flights to Asia because it is a hub airport. As a hub, Heathrow is different to other UK airports, because it can pool international, continental, domestic and local demand for leisure and business passengers as well as air freight, making direct flights to more cities around the world, particularly emerging markets, more commercially viable for airlines. It is critical that northern cities are well connected to Asia and the most viable way to do this is with better connectivity to Heathrow Airport.

While the National Infrastructure Commission is not looking at airport capacity, it is important the Commission notes the GDP and job benefits (outlined below) that an expanded Heathrow could bring northern city regions and the additional benefits that links to other infrastructure projects could also bring the North, for example linking HS2 and Crossrail 2 to Heathrow for northern passengers.

The independent Airports Commission produced an assessment of the economic benefits that would arise from airport expansion in terms of jobs and GDP (in Net Present Value). It also produced a broad breakdown of where in the UK the overall GDP increase effects will arise. These are presented for three broad regions (London & South East; Rest of England; and Rest of UK) for the scenario it defines as “Assessment of Need.”

Table 1: Present Value of regional real GDP impacts – Assessment of Need Scenario⁴

³ The European Commission, Aviation Strategy for Europe, December 2015

⁴ Source: Airports Commission, “Economy: Wider Impacts Assessment” Tables 18 & 36

Written evidence submitted by Heathrow Airport Limited
National Infrastructure Commission: call for evidence

	Heathrow
London & South East	39.83%
Rest of England	43.78%
Rest of UK	16.39%

Source: Airports Commission, “Economy: Wider Impacts Assessment” Tables 18 & 36

Heathrow then commissioned Quod to do a further breakdown of the Airports Commission’s work to UK regions and converted the results to jobs based on GDP per worker. The Airports Commission estimates that the Heathrow North West Runway option would create an additional 179,800 jobs by 2050 under the Assessment of Need scenario. The estimated regional breakdown is as follows:

Table 2: Regional breakdown of jobs based on GDP per worker, controlled to AC estimates

	Heathrow	Gatwick
London	38,500	9,300
South East	33,200	8,000
London & South East	71,700	17,200
Yorkshire & Humber	11,300	3,500
North West	15,300	4,800
North East	5,100	1,600
East	12,900	4,100
East Midlands	9,800	3,100
West Midlands	12,000	3,800
South West	12,300	3,900
Rest of England	78,800	24,800
Scotland	16,100	4,100
Wales	8,400	2,200
Northern Ireland	5,000	1,300
Rest of UK	29,500	7,600
TOTAL	179,800	49,600

This table demonstrates the job benefits Heathrow expansion will bring northern cities and the significantly more jobs Heathrow expansion will bring the North compared to Gatwick. The difference in job numbers between expanding Heathrow versus Gatwick is attributed to the increase in manufacturing jobs and Heathrow is one of the UK’s most significant ports, moving the most freight by value in the UK. Heathrow is also the most important freight airport in the UK, moving more cargo than all other UK airports combined. In 2014 Heathrow moved nearly 1.5 million tonnes; followed by East Midlands International at 277,413 tonnes; Stansted 204,725 tonnes; Manchester 93,466 tonnes and Gatwick moving 88,508 tonnes. In terms of other northern cities, in 2014, 5,119 tonnes moved through Birmingham; 4,450 tonnes through Newcastle and 236 tonnes at Liverpool (CAA, UK Airport Freight Data, 1990 – 2014⁵, Refer to APPENDICES A & B). This demonstrates the importance of connectivity (rail and domestic flight links) to Heathrow for exporters in the North and indeed around the country.

Written evidence submitted by Heathrow Airport Limited

National Infrastructure Commission: call for evidence

Again, while the Commission is not looking at airport capacity, it is important that the Commission notes the added benefits to the freight community when prioritising infrastructure projects, such as rail links to Heathrow, which generally brings significantly more benefits than any other airport.

HS2 provided a unique opportunity to deliver a properly integrated transport system with a direct connection to Heathrow. This could have been key to delivering benefits for passengers and achieving Government objectives for more sustainable travel, improving domestic and international connectivity, economic growth and carbon reduction. The Government initially supported a direct link to Heathrow on the basis that it would:

- a. Significantly enhance its accessibility by rail from the Midlands and the North;
- b. Provide new opportunities for growth and investment in those regions;
- c. Create a multi-modal transport 'hub' at the airport;
- d. Ensure that HS2 passengers would not have to change trains to access Heathrow;
- e. Incentivise further surface access investment at Heathrow; and
- f. Yield benefits right across the country.

However, the Government subsequently abandoned the proposals for a spur to Heathrow in early 2015, primarily on the basis that this was not considered necessary to support Heathrow's expansion. This unexpected decision represented a significant blow to regions in the Midlands and the North that could have benefited from direct rail connectivity to Heathrow, particularly where many domestic/ regional air connections have been lost. This is an example of how northern city regions will be disadvantaged through our inability to properly plan our major high speed rail network, despite some very clear strategic benefits. In the absence of a spur, a high quality interchange at Old Oak Common is essential.

Heathrow is currently the best connected airport by road in England. Based on ONS connectivity work, over 7m people have Heathrow as the airport with the shortest journey time by road. For Birmingham, London City and Manchester this figure is below 5.5m. For public transport, Heathrow is the airport with the quickest journey time for around 5.8m people. As you can see, there is a gap of more than a million people for whom Heathrow is the shortest journey by car, but not by public transport. Making public transport to Heathrow a more attractive option, with journey times competitive in comparison to those by private transport needs to be addressed so that passengers from all over the UK have different options available for accessing Heathrow.

The priority is for schemes to provide direct rail connectivity through the delivery of Crossrail, Western Rail Link and Southern Rail Access because 50% of surface access journeys to Heathrow have origin/destinations in London and a further 25% in the South East. However, over a million passengers a year currently travel from Scotland, Yorkshire & the Humber, North East and North West England via ground transportation to Heathrow. Those travelling by rail outside of London need to travel to Paddington, by London Underground or make use of one of the rail-air coach services, so Heathrow connectivity can still be improved for the rest of the UK. If the Government is serious about improving the growth of our regional cities, improving traffic congestion and reducing vehicle emissions, these passengers and their locations need to be served via key rail interchanges so that public transport options are at least as attractive to them as private transport options.

For example, York has excellent connectivity with London via East Coast Main Line and as a result the journey via rail to Heathrow is around 40 minutes shorter than the equivalent road journey. Derby, on the other hand, has a road journey which is almost half as short as the rail option (150 mins by car vs. 276 mins by rail). 54% of passengers arriving at Heathrow from York have done so by rail or tube, for Derby it is only 21%, which highlights the effect good rail links have on passengers' transport choice.

Only Leeds/Bradford, Manchester, Newcastle and Liverpool serve more direct passengers from The North than Heathrow does each year. Currently, twice as many passengers reach Heathrow by public transport from Scotland, Yorkshire & the Humber, North East and North West England than Gatwick (in 2014 657k vs. 327k respectively) more than Newcastle (504k in 2013) and almost as many as Liverpool (688k in

Written evidence submitted by Heathrow Airport Limited

National Infrastructure Commission: call for evidence

2014). In fact only Manchester can boast significantly more passengers from the North arriving via public transport (3m in 2014).

The Piccadilly Line upgrade will increase line capacity by 60% through a new signaling system and trains allowing faster and more frequent services. While delivery timescales are yet to be finalised, this could provide up to 18 trains per hour serving Heathrow, compared to 12 trains per hour currently. This will improve the offering for passengers arriving at Heathrow from northern cities via London. Western Rail Link to Heathrow by National Rail's Control Period 6 will provide yet more integration to cities like Newcastle, Derby, Sheffield and Leeds via Reading.

The new HS2 interchange at Old Oak Common will be served by frequent Heathrow Express and Crossrail services, providing important connectivity to key cities in the Midlands and the North. This will transform Heathrow journey times for the North, bringing Birmingham within an hour of Heathrow and both Manchester and Leeds within around 90 minutes. This will make rail journey times to the airport significantly better than those by road and also avoids multiple interchanges through London by rail for passengers traveling from the North.

With these additional rail services in place, the number of trains per hour serving Heathrow would double by 2030 to 36 trains per hour with capacity increasing from around 5,000 seats per hour to almost 13,000. Improving rail connectivity to Heathrow will grow the number of people and businesses that can access Heathrow and its direct global connections. Heathrow's surface access strategy sees substantial increases in the number of people who could reach the airport by public transport. Shifting airport passengers from private cars to public transport will also free up capacity on the highway network and provide increased demand on public transport services throughout the day.

The Airports Commission concluded that better rail connections could bring 10 million people within three hours of the airport by public transport. In many locations this will mean that public transport is directly comparable or better than the alternative journey by road helping support the Government's objectives on modal shift and reducing road congestion and emissions for the UK.

Some of the key journey time savings for northern cities is summarised in the table below:

Station	2013		2032	
	Journey time	Interchanges	Journey time	Interchanges
York	3 hours 03 minutes	2	1 hour 52 minutes	1
Newcastle	4 hours 01 minutes	3	2 hour 54 minutes	2
Hull	3 hours 46 minutes	2	2 hour 51 minutes	1
Leeds	3 hours 30 minutes	2	1 hour 48 minutes	1
Liverpool	3 hours 29 minutes	2	1 hour 51 minutes	1
Manchester	3 hours 16 minutes	2	1 hour 28 minutes	1
Sheffield	3 hours 17 minutes	2	1 hour 39 minutes	1

These cities alone represent almost 500,000 pa direct passengers accessing Heathrow via ground transport today.

2. *What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.*

The Commission should note that it is not just city-to-city connectivity that could address these weaknesses, but also city-to-airport connectivity. Strategic connectivity to airports is important because as recognised in the European Commission's new European Aviation Strategy 'studies show that the better a city, region or country is connected by air to other destinations in Europe and other parts of the world, the more growth can be generated.' The Commission's new Strategy also recognises aviation and airports as 'strong drivers of economic growth, jobs, trade and mobility for the European Union' – and hence has listed 'tackling limits to growth in the air and on the ground by reducing capacity constraints and improving efficiency and connectivity' as one of its three key priorities. The surface access network connects people and freight to Heathrow, the UK's only hub airport. It generates economic growth by helping UK businesses connect with existing and emerging markets. Research shows there is a strong link between a passenger's surface access experience⁶ and their overall satisfaction with Heathrow. It is also a main influence on their choice of airport (CAA passenger choice report from 2011 pg. 20-21)⁷. Since passengers value reliable, convenient, direct and frequent services, we have to make sure that Heathrow's surface access meets the needs and expectations of its users.

3. *Which city-to-city corridor(s) should be the priority for early phases of investment?*

In terms of city-to-city connectivity, it is in the Government's gift to review and implement Public Service Obligations and protect domestic UK air links.

That said, connections to London Heathrow should be prioritised because Heathrow is one of the UK's most significant ports, moving the most freight by value in the UK. Heathrow is also the most important freight airport in the UK, moving more cargo than all other UK airports combined (CAA, UK Airport Freight Data, 1990 – 2014⁸, Refer to APPENDICES A & B).

4. *What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?*

One of the key international connectivity needs in the next 20-30 years in the North, which was recognised in the European Commission's recently launched European Aviation Strategy is 'the shift of the world's economic centre of gravity towards the East, notably Asia'⁹ and how the North will connect to the East. As outlined in our response to Question 1, Heathrow offers more direct and frequent flights to Asia because it is a hub airport and as a hub airport, Heathrow is different to other UK airports, because it can pool international, continental, domestic and local demand for leisure and business passengers as well as air freight, making direct flights to more cities around the world, particularly emerging markets, more commercially viable for airlines. Therefore with the global shift to the East, it is critical that northern cities are well connected to Asia and the most commercially viable way to do this to benefit the UK economy is through better connectivity to Heathrow airport.

That said the UK's regional airports play an important role in connecting regional city regions, but they play a different role to Heathrow. Regional airports have capacity and can provide services where there is direct demand. Otherwise access to a hub airport by surface transport or air is critical to satisfy the region's complete connectivity needs. Therefore surface access to airports and to Heathrow via air and rail are the most effective ways to meet future connectivity needs.

⁹ The European Commission, Aviation Strategy for Europe, December 2015

2. London's transport infrastructure

1. *What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?*

As mentioned in section 1, with the global shift to Asia, London's status and its continuing success as a global centre for business is critically dependent on the quality of its international connectivity, as well as its local transport infrastructure. London is expected to see major population growth, but it is in competition with other cities around the world, so investing in London's transport infrastructure and connectivity is key to maintaining its competitive edge and status as a leading global city for its residents, businesses, international investors, exporters, students and tourists.

Demand for connectivity to Heathrow and the capacity of the UK's only hub airport are only going to increase with London's growing population. According to the Greater London Authority, London's population is currently around 8.6m people. The middle estimates for the population in 2050 are around 11m. With over 14m people living in the London commuter belt area, it is essential that people who wish to work and live in London are well connected to all parts of the capital, the South East England, the UK and to the rest of the world.

Heathrow airport obviously plays a significant role in connecting London to the world and the world to London, but it is also a major employer and driver of job creation across the capital. For many local commuters Heathrow is not at the end of the Piccadilly Line, it is at the start and enables them to access London and the associated job market. Similarly, Heathrow Connect and in the future Crossrail will play an important role in empowering airport related workers to make public transport journeys from West London. The Office of National Statistics work on Travel To Work Areas based on the 2011 census has shown that Heathrow and Slough were designated as a separate TTWA, rather than being spread between London and Thames Valley areas. This is against a trend of these areas growing and swallowing up areas due to more concentrated economic activity and a trend to longer commutes to work over the previous decade.

2. *What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?*

- *How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?*
- *What might their potential impact be on employment, productivity and housing supply in London and the southeast?*

One of the strategic options for future investment in large-scale transport infrastructure improvements in London is in improving Heathrow's connectivity to the wider rail network to ensure that London and the wider South East can benefit from and fulfil Heathrow's global hub route network, taking advantage of the interchange opportunities provided at Heathrow.

The key rail priorities for Heathrow are:

- Crossrail
- Western Rail Access
- Southern Rail Access
- Piccadilly Line upgrade
- HS2

Investment in rail to Heathrow is supported by Network Rail's 2013 London & South East Market Study, which notes how good rail connectivity to airports is important in supporting economic growth, productivity and social mobility and plays a key role in providing better access to markets,

national and international destinations, business and leisure opportunities, and to jobs. It confirms that integrating new and improved rail services with other transport modes at major airports is key to delivering sustainable travel opportunities and improving overall connectivity. The study recommends that rail services should provide for the growing demand to access airports by rail, with fast, convenient and reliable rail access to central London a priority for London's airports but direct access to non-London core economic centres both long-distance and within the London and South East area increasingly important.

In the future Heathrow will provide direct terminal access to passengers from every mode of transport. They will be connected to the Underground network and have fast dedicated rail services to London provided by Heathrow Express. In 2019 Crossrail will link Heathrow to the City, Canary Wharf and East London. Western Rail Access will provide fast direct services to the West and South Wales. Southern Rail Access will connect Heathrow to Waterloo and the South and South-West mainlines. In 2026 the new HS2 rail line will provide fast access to Heathrow from the Midlands and the North by 2030.

The transport improvements already committed plus those planned can transform Heathrow into a fully integrated national transport hub that offers connectivity benefits for the local area and the rest of the UK. Heathrow will be a vital component of the national transport system and provide new direct transport links for local communities.

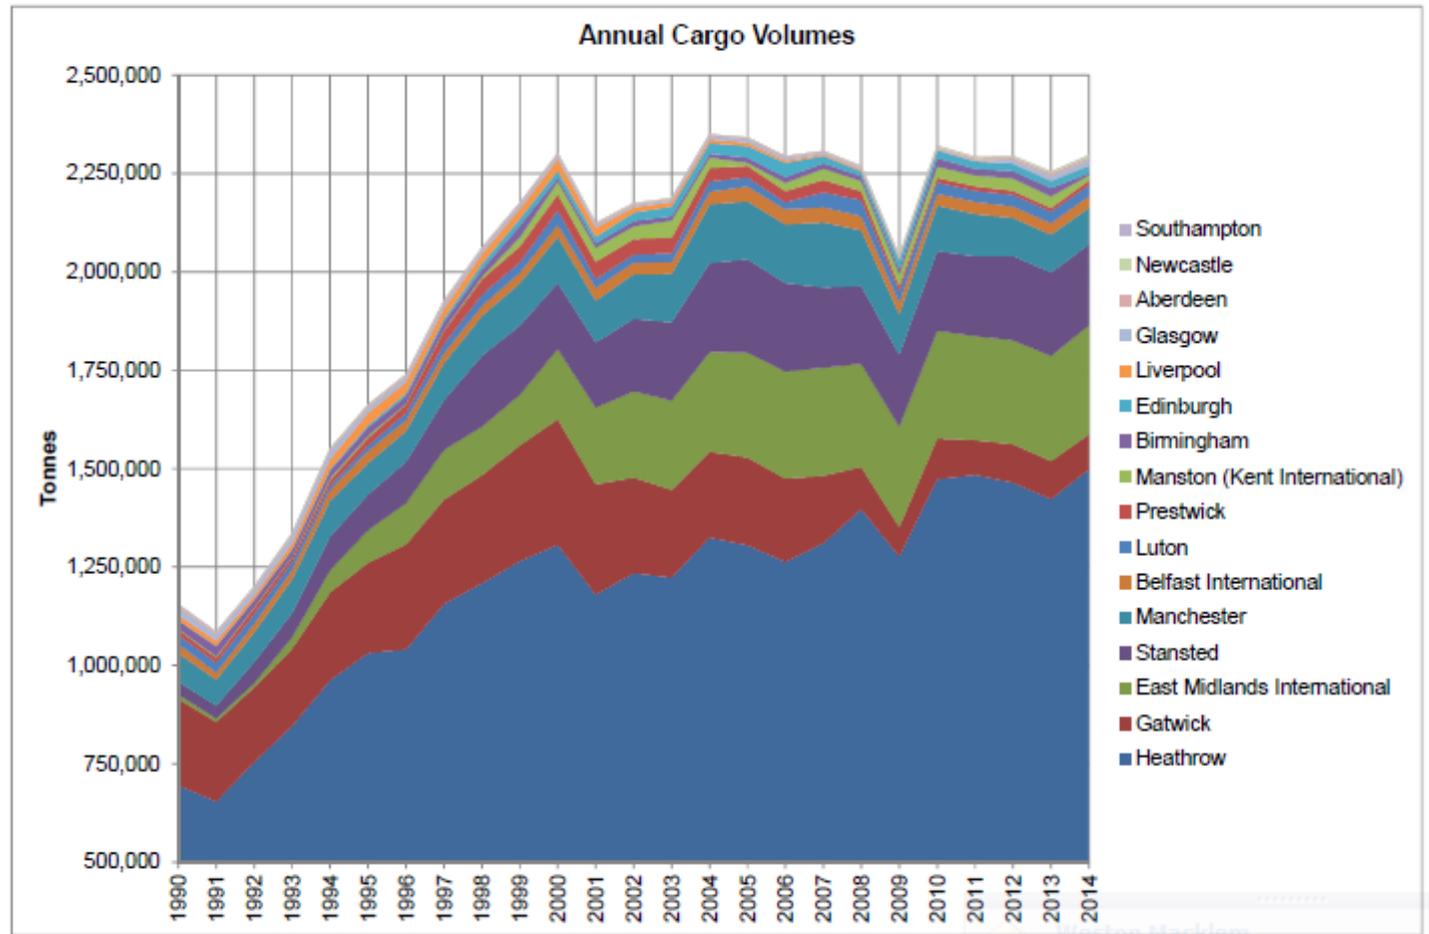

Increasing the modal shift onto public transport is also another priority for Heathrow. Heathrow's public transport improvements will increase transport resilience and give passengers, colleagues and members of the public choice. This is why we believe that projects like Crossrail, Western Rail Link and Southern Rail Access are essential, not just for Heathrow, but for the surrounding areas. Providing this infrastructure will increase public transport mode share, reducing the negative impacts on the local environment from car journeys such as traffic and emissions.

Southern Rail Access will also provide choices, by rail, for the large swath of Heathrow's passengers who live in South West London that don't rely on a journey into and out of central London. Western Rail Link will do likewise for the population to the west of the airport. While Crossrail 2 is not directly linked to Heathrow, enabling it to connect smoothly and quickly with Crossrail, Southern Rail Access and the existing rail and underground networks will mean more and more people are able to get to Heathrow more quickly and conveniently, whether they are coming across London or through it.

These, again, are good for the passenger, the local areas and the country as a whole. Planning and investment in progressing these strategic links to Heathrow should be a high priority in London's infrastructure improvements.

Heathrow Hub Ltd response to the National Infrastructure Commission's Call for Evidence

8th January 2016

Introduction

Heathrow Hub Ltd. is pleased to respond to the Commission's call for evidence on London's transport system, and the strategic options for future investment in large-scale transport improvements.

We are the promoter of one of the three schemes for airport expansion shortlisted by the Airports Commission and currently being considered by Government.

We suggest that the Commission considers London's transport system as part of a wider regional network. We believe that London, in its narrowest geographical sense, cannot be considered in isolation if the objective is to achieve the most economically, socially and environmentally effective and efficient overall system.

Investment in large-scale transport infrastructure improvements in London

Government has directed that the Commission is not to consider issues relating to airport capacity, stating "*the Davies Commission has already examined this issue in detail.*" However we believe the critically important issue of airport surface access should not be separated from wider considerations of London's transport network.

Heathrow suffers from poor rail connectivity compared to its major competitors, and passenger numbers will continue to grow as airlines optimise scarce capacity through use of larger aircraft. DfT forecasts terminal passenger numbers will increase in a two- runway constrained airport, from 73m in 2014¹ to c.93m by 2050.² An additional runway, if approved by Government, is forecast to increase Heathrow's terminal passengers to 170m by 2050.³

Roads are increasingly capacity constrained and background growth in rail demand places growing stress on the rail network. Separate consideration of airport and non-airport connectivity is unlikely to achieve the most efficient outcome.

Heathrow Express shows why an integrated strategy is needed. Using 20% of the Great Western Main Line's (GWML) constrained capacity, and scarce platform capacity at Paddington, it achieves a

¹ <http://www.heathrow.com/company/company-news-and-information/company-information/facts-and-figures>

² Annex E2 Terminal Passenger Forecasts (constrained), UK Aviation Forecasts DfT January 2013
https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/223839/aviation-forecasts.pdf

³ Annex D8 ibid

very low load factor of c30% in the critical three-hour morning peak, at a time when other GWML services are operating at or above 100% capacity.⁴

As well as being inherently inefficient, this form of dedicated airport service fails to provide the best possible service for air passengers. European experience at for example Schiphol, Frankfurt and Charles de Gaulle shows that airports which are instead served by through stations on main lines provide air passengers with very high frequency services to a wide range of destinations.

Other passengers also benefit from the additional network capacity that would otherwise be inefficiently used by dedicated airport services. This is highly relevant to Government's request that *"the Commission should consider relevant international experience in major metropolitan areas, to review how other cities have responded to similar challenges and priorities, and whether there are any lessons to be learned and applied in London."*

The proven European approach has now been adopted in part for the similarly capacity constrained Brighton Main Line, where Gatwick Express services also serve Brighton in the peaks.

However, plans for dedicated airport services over a new Western Rail Access to Heathrow (WRAtH) continue to be progressed, despite the Airports Commission's analysis showing that such dedicated airport services from Reading and intermediate stations would have extremely low load factors⁵ as a result of slow journey times and the need for most passengers from the west to change trains at Reading.

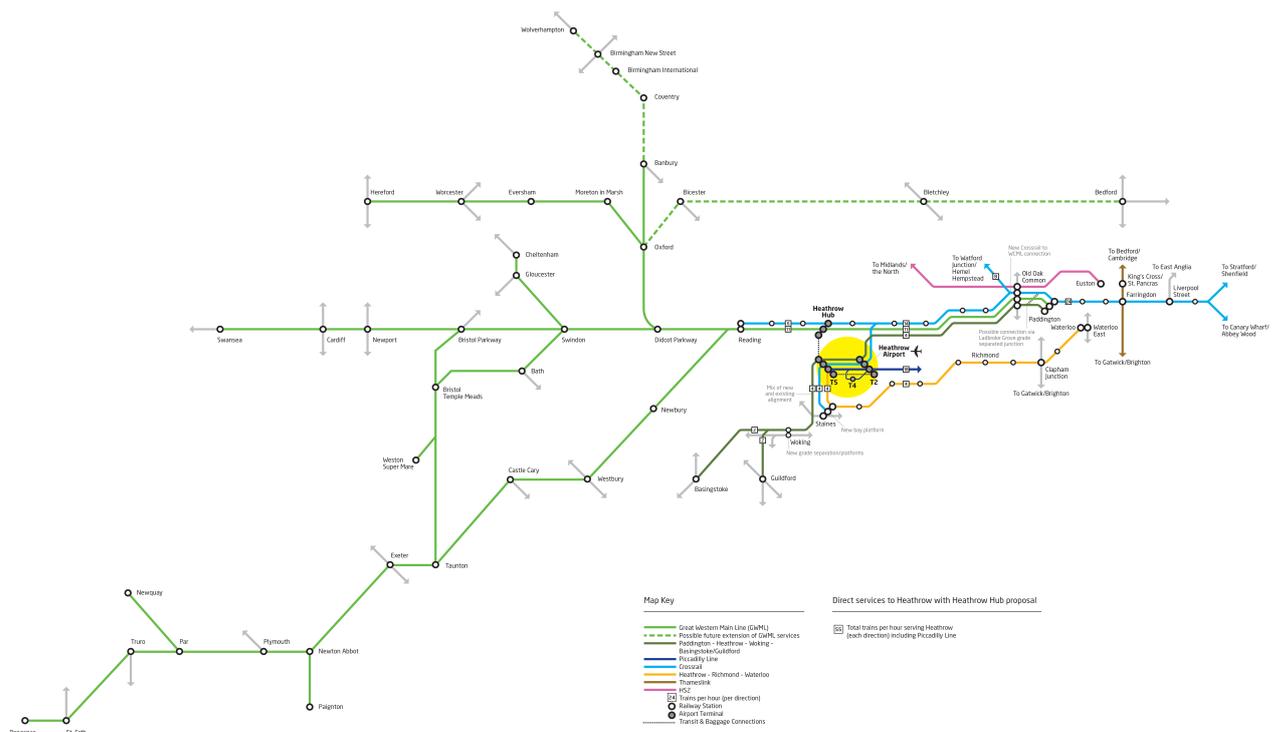

This is relevant to the Commission's consideration of London's rail network. WRAtH requires significant (4tph) capacity on the Great Western Relief Lines which, together with the need to retain and potentially increase freight paths, will act as a considerable constraint on Crossrail and prevent this very large investment from maximising its potential to the West of London. The proposed relocation of Heathrow Express's depot to Langley as part of the HS2 scheme may further exacerbate these capacity challenges, (with the additional risk that the depot could be redundant after expiry of Heathrow Express's Track Access Agreement in 2023).

Our alternative innovative and integrated approach to Heathrow's rail connectivity has two major benefits.

- It provides benefits to both airport and non-airport users, in line with Government's recognition of the need to *"consider the relative importance of, and trade-offs between, capacity, reliability, journey times and connectivity to markets"* and;
- It has a relatively low capital cost and high revenues, (as well as delivering very substantial wider economic and environmental benefits) and is therefore capable of being entirely financed by the private sector. This meets the Government's objective of *"funding and financing (infrastructure) in a way that minimises the tax payer burden."*

⁴ Table 4.2, London and South East Route Utilisation Strategy, Network Rail July 2011

⁵ "A four train per hour service would have spare capacity with the busiest sections reaching 31% of seat capacity but reducing to as little as 16% of hourly seated capacity (and 6% of hourly total capacity) at the Reading end of the WRAtH route" - Para 4.7.8, Surface Access: LHR-NWR, Jacobs for Airports Commission, November 2014

Our proposals comprise two principal elements.

1 - Heathrow Hub interchange

This road and rail interchange provides a new airport entry point and passenger processor, located on a largely unconstrained and readily developable 200 acre site c.4km north of Heathrow T5, on the Great Western Main Line (GWML) between Iwer and West Drayton stations where it crosses the M25. Fast passenger transit and baggage connections link the interchange directly to the airport campus, providing options for airside, landside or combined systems.

The station layout allows all GWML trains to call, with through lines allowing the option of Main Line non-stopping trains to pass at line speed. The station also effectively provides a dynamic loop on the Relief Lines in each direction, which, with its location roughly mid-way between Reading and Paddington, allows a new “Crossrail Express” service pattern west of Paddington. This, stopping only at Heathrow Hub and Reading, would be highly attractive to Reading passengers, incurring only a 8-10 minute journey time penalty compared to existing GWML services between Reading and Paddington.

This penalty would be more than offset by enabling passengers to avoid the need to interchange to Crossrail at Paddington. The likelihood that Crossrail will be integrated into TfL’s zonal fares structure also makes this an attractive alternative to existing GWML services, freeing these from the constraints imposed by their currently attempting to serve both commuter and long distance markets. The cross-platform interchange between stopping and express Crossrail services at the Hub would also reduce journey times for passengers from intermediate stations.

Current plans envisage 14 of the peak 24tph Crossrail service from the East turning back West of Paddington.⁶ With our proposal the extension of Crossrail to Reading allows a service pattern that unlocks the project's full potential and maximises the very considerable investment in this new infrastructure.

The Airports Commission also recognised the potential for the Hub interchange to provide air quality⁷ and road decongestion benefits⁸ as a result of dispersing road traffic entry points to the airport – an example of the benefits of an integrated, multi-modal approach to transport infrastructure planning.

2 - Southern Rail Access

This consists of two separate but related service groups.

The first, an amended version of BAA's former Airtrack scheme, provides direct services from London Waterloo to Heathrow via Clapham Junction and Richmond using a section of new rail infrastructure North of Staines between the Windsor Lines and Heathrow. We propose this would also be used by Crossrail, extending currently planned Heathrow services to terminate in a new bay platform at Staines to provide connectivity with currently un-served South Western catchments.

The second is a fast rail link from Woking to Heathrow, with trains from the South operating over a further new section of railway South of the junction with the Windsor Lines, twinned with the M25 motorway corridor and continuing through Heathrow, using the existing Heathrow Express paths, to Paddington. This overcomes the problems that contributed to the failure of Airtrack, including uncompetitive journey times and extended level crossing barrier downtime.

These combined proposals provide major benefits, those relevant to the Commission including:

- Direct trains to Paddington from the South and South West, providing an alternative London terminal with Crossrail providing excellent connections to the West End, the City and Docklands.
- Significant crowding relief to the South Western Main Line (and the LUL network at Waterloo for onward journeys). The density of operation on the Up Fast Line from Surbiton during the peak is higher than on any other single stretch of main line in the UK and Network Rail's Wessex Route Study forecasts a need for an additional 60% capacity in the high peak hour by 2043.⁹

⁶ <http://content.tfl.gov.uk/rup-20150212-part-1-item-09-crossrail.pdf>

⁷ The proposed Hub interchange "could potentially produce air quality benefits by bringing traffic off the M4 and M25 before reaching Heathrow" - Para 8.16 Final Report, Airports Commission July 2015

⁸ "The Hub has the potential to intercept traffic flows destined for Heathrow from the north and west, reducing pressure on already congested sections of the M4 and M25, plus the local roads approaching the terminals. Jacobs traffic analysis provides evidence that the approach reduces pressure on M25 junction 15, with lower peak hour flows approaching from all directions" - Para 5.3.2, Appraisal Framework Module 4, Surface Access: Heathrow Hub Station Analysis Compendium, Jacobs May 2015

⁹ "An additional 60 per cent capacity is required in the high-peak hour to meet the 2043 capacity conditional output for Main Line long distance services (conditional output CO3). This implies a need for more than 150 extra passenger vehicle arrivals at London Waterloo during the high-peak hour, which is equivalent to an additional 13 paths (assuming 12-car 20 metre vehicles configured with 3 + 2 seating in standard accommodation)" – Para 4.2.44, Wessex Route Study, Network Rail August 2015

- Significant crowding relief to LUL services at Waterloo.
- Maximising effectiveness of Crossrail investment.

More radically, this proposed service pattern could take advantage of the possible intervention identified in Network Rail's Western Route Study of a new grade - separated junction in the Ladbroke Grove area in CP6 alongside a rationalisation of the Paddington approaches.¹⁰ Subject to the detailed design of the junction, it is possible that this would allow Woking/Heathrow services to run on the Great Western Main Lines from Airport Junction, using existing Heathrow Express paths, before crossing to the Relief Lines to continue through the Crossrail central London tunnel. This would dramatically improve London's connectivity whilst also releasing valuable platform capacity at Paddington.

We commissioned modeling from AECOM (formerly URS), using, with their agreement, HAL's "LASAM" and TfL's "Railplan" models.

The results indicated an average peak loading of around 387 passengers per train between Woking and Heathrow (around 60% of capacity), the majority of whom are forecast to transfer from Waterloo services. This provides significant and highly desirable direct relief to the South Western Main Line and the LUL network serving Waterloo.

The trains would be at around 100% of capacity between Heathrow and Old Oak Common – compared with c30% for Heathrow Express currently, thus delivering effective use of scarce line capacity.

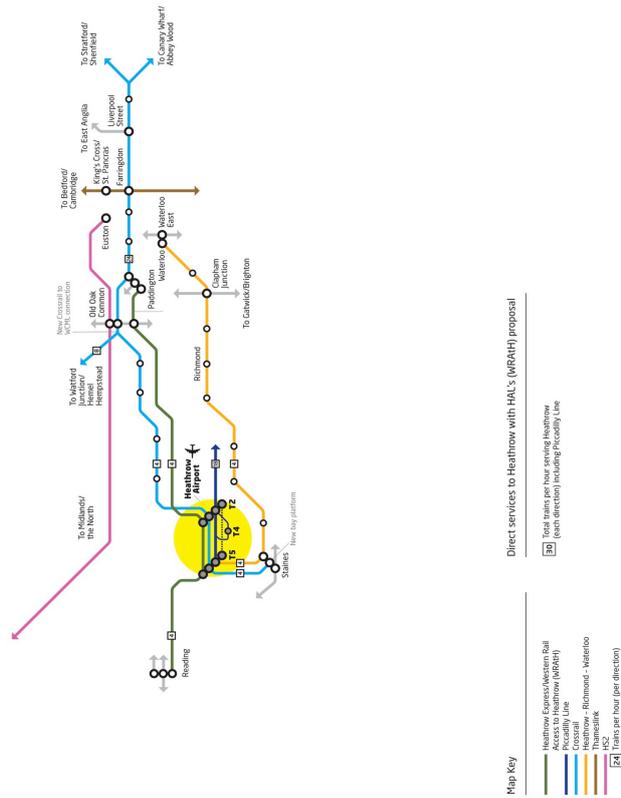

Conclusion

We believe our proposals provide overwhelming benefits and, critically at a time of constraints on public expenditure generally and on rail enhancements in particular, are capable of being privately funded.

Our proposals have been developed with a world class team of expert consultants including AECOM, Gardiner & Theobald and First Class Partnerships and in liaison with Network Rail and TfL. Heathrow Hub Ltd has also participated as a full member in Network Rail/DfT's Southern Rail Access Working Group, the report of which is due to be published shortly.

We believe it is helpful to compare our integrated proposals with the alternative rail schemes that are being separately brought forward.

¹⁰ "Grade separation of Ladbroke Grove Junction would increase the capability of the whole system, reducing the level of conflicting train movements creating greater timetable capability, increasing flexibility in the platforming and operation of services using London Paddington and associated depots"- 05, Western Route Study, Network Rail August 2015

In contrast, the current uncoordinated plans for Heathrow Express, WRAtH and Crossrail achieve far fewer benefits at a high cost to the public purse, deliver a lower overall return on investment and, in the case of WRAtH, are likely to require ongoing revenue support.

We have deliberately made this submission as brief as possible but would of course welcome the opportunity to engage with the Commission to discuss our proposals in greater detail.

National Infrastructure Commission call for evidence: 'London's transport infrastructure'

Evidence submitted by the iBUILD Infrastructure Research Centre,
January 2016

Introduction

The iBUILD (Infrastructure **B**usiness models, valuation and **I**nnovation for **L**ocal **D**elivery) Infrastructure Research Centre brings together a multi-disciplinary team from Newcastle, Birmingham and Leeds Universities to improve the delivery of local and urban infrastructure. iBUILD is developing and demonstrating alternative infrastructure business models that: take a whole life cycle view of infrastructure systems; exploit technical and market opportunities from modern interconnected infrastructure; leverage economic, social, environmental, aesthetic and other values from infrastructure; identify changes in governance, regulation and policy to unlock improvements; and, use innovative financing and funding mechanisms.

iBUILD promotes a service and system-wide approach to local and urban infrastructure, believing that there are significant advantages to be gained from planning, investing and managing infrastructure on an interdependent basis. As the recent floods in Cumbria, Northumberland and elsewhere in the north of England demonstrated, long-term resilience should be built into the UK's infrastructure sectors and systems. Otherwise, the potential economic and social benefits that can be derived from infrastructure investment will be marginal compared to the economic, social and environmental costs of repairing infrastructure that is damaged or destroyed by adverse (but increasingly regular) weather-related events.

The emergence of the National Infrastructure Commission (NIC) reflects the recent emphasis towards national scale infrastructure planning in the UK, and provides an important strategic context for the planning, development and operation of infrastructure. However, it is also important to consider the distinct role of local and urban infrastructure in driving local, regional and national economies. It is at the local and urban scales where infrastructure services are most dense and where the majority of people use infrastructure services in their everyday lives. Balancing growth across different geographical scales – from the local to the city/city-region – is vital to the long-term success of the national economy, as infrastructure drives local economic growth and job creation, as a consequence of construction and management activities as well as the enhancement and facilitation of other economic activities.

The response below first summarises key findings from our research programme that are relevant to all infrastructure delivery, before specifically responding to the consultation questions. Our response draws predominantly on new research identified during the iBUILD project, but also decades of research and experience in the iBUILD team. This includes engineering expertise in the Centre for

Earth Systems Engineering Research (CESER)¹ and the Institute for Resilient Infrastructure (IRI)², and the long-standing track record in local and regional development by the Centre for Urban and Regional Development Studies (CURDS).³

iBUILD focuses on all infrastructure sectors, not just transport, but our work has also drawn lessons from non-infrastructure sectors. Where our research is undergoing external peer review we cite working papers which, amongst other work, can be found at www.ibuild.ac.uk.

iBUILD Mid-Term Review and Policy Manifesto

In March 2015, iBUILD published a mid-term review and manifesto setting out thirteen evidence-based policy recommendations on how local and urban infrastructure business models could be strengthened in both design and in application. The key recommendations are elaborated in the full manifesto document which is available online.⁴

Research from across the iBUILD Centre has identified five priority action areas for government and industry. If applied to all infrastructure planning and decision-making, these action areas will help to challenge the “timid, uncoordinated, incremental, wasteful”⁵ way the UK currently builds and manages its infrastructure, and help to develop a new approach to delivering infrastructure systems and their services that will enhance the health, wealth and security of UK citizens.

Priority Action Area #1: Have a broader, integrated appreciation of infrastructure

Infrastructure is not just tracks, tubes and trunk roads. Failure to consider the resources that flow along these, the services they provide and the people and businesses that depend on them, will lead to investments that don't deliver effectively. At the same time, it is crucial to understand how all these systems are interconnected; infrastructure depends on other infrastructure to work, not just technically, but also economically and socially. The UK's infrastructure is amongst the most mature and interconnected in the world and therefore has a pressing need to adopt a broad, integrated and sophisticated approach to infrastructure planning.

Recommendation 1: Infrastructure planners, financiers, engineers and other stakeholders need to use a broad, but appropriately specified, definition of infrastructure if they are to identify the full range of opportunities from alternative business models.

Recommendation 2: Housing and ‘hidden infrastructure’, such as efficiency measures, should be considered alongside the large-scale capital investments with which they interconnect, within infrastructure and spatial planning processes

¹ www.ncl.ac.uk/ceser

² <https://www.engineering.leeds.ac.uk/resilience/>

³ www.ncl.ac.uk/curds

⁴ iBUILD (2015) *Are you being served? Alternative infrastructure business models to support economic growth and well-being*, iBUILD Manifesto and Mid-term Report, Newcastle University: Newcastle upon Tyne. The full manifesto can be downloaded from <http://research.ncl.ac.uk/ibuild/outputs/>

⁵ Infrastructure UK (2010) *National Infrastructure Plan 2010*, First NIP: October 2010, HM Treasury.

Recommendation 3: National reforms in policy and regulation are required to enable an integrated approach to local infrastructure planning that can identify, and has the capacity to exploit, synergies across infrastructure sectors.

Priority Action Area #2: Enable action at the local scale that connects with the national

Too much infrastructure planning is top-down, yet every piece of infrastructure has to go somewhere; it is inherently local. Top-down approaches to infrastructure development and management stop locally-led and innovative business models from flourishing and discourage innovation. It also risks the wrong infrastructure being put in the wrong place at the wrong time because of a lack of local knowledge, engagement and ownership. These issues prevent the UK from maximising returns from infrastructure investment. The UK must devolve an appropriate and sensible proportion of infrastructure investment and responsibility to local institutions so they can deliver infrastructure that better reflects the values and needs of the communities it serves, yet remain mindful of the national strategy.

Recommendation 4: National and local policy frameworks should be realigned to focus on delivering wider societal benefits and to enable local infrastructure business models to emerge that can provide local solutions that are complementary with mainstream systems.

Recommendation 5: Effective operation of local alternative infrastructure business models requires greater fiscal decentralisation, complemented by a stronger and statutory devolved role for cities and localities in the planning, development and delivery of infrastructure.

Recommendation 6: Provide support for a wider range of innovative local infrastructure financing mechanisms, including tax increment financing, municipal bonds, social impact bonds and crowd source funding approaches.

Priority Action Area #3: Capture long-term value of every kind

Infrastructure is not only about cash returns. Investment in infrastructure provides wider health, economic and environmental benefits for society; infrastructure converts financial value to social value. A new economic valuation system that recognises these long-term, whole-life benefits is essential to maximise the benefits. Infrastructure must also be built for minimum whole-life costs. This might mean paying a bit more upfront for something that will last – and serve – for longer without the need for frequent maintenance; a resilient and sustainable infrastructure.

Recommendation 7: Incorporate measures of social and environment benefit (and cost) into infrastructure appraisal frameworks to recognise the wider societal and environmental outcomes and ascertain the widest possible set of mechanisms to capture revenue and other values.

Recommendation 8: Implement a quantitative framework within the infrastructure appraisal process to assess the value of flexibility and resilience across the whole system over the long-term.

Recommendation 9: Local authorities and infrastructure owners should apply resource assessments as a matter of course to identify the potential of land and infrastructure assets to generate long-term, stable revenue streams and not just one-off, short-term windfalls from selling-off assets.

Recommendation 10: Employ a new approach to infrastructure economics that recognises the long-term and system-wide value of infrastructure provision.

Priority Action Area #4: Deliver more efficient planning, procurement and delivery

Approaches to project financing, funding and delivery should not be chosen for political reasons. Mechanisms must be adopted that can best deliver the desired economic, social and environmental values, regardless of their political flavour. Many of methods and tools to enable this already exist: the Project Initiation Routemap, Building Information Modelling (BIM) systems, life-cycle assessment, so they must be used. These approaches support more efficient planning and procurement, minimise costs and human effort, preserve the environment, and maximise the potential to reuse and recycle materials and components in the future.

Recommendation 11: Implementation of the Project Initiation Routemap has been shown to have many cost reduction benefits and should be made standard practise for all public funded projects.

Recommendation 12: Planning and design of infrastructure should consider the material and resource demands of infrastructure pipelines to identify opportunities for reducing waste in the construction and operation phases, whilst designing for end of life material recovery or repurposing of infrastructure.

Priority Action Area #5: Accelerate the uptake of innovations through practical action and demonstration

Action often speaks louder than words. Alternative approaches to infrastructure business models are emerging. However, to quickly identify the most successful approaches and encourage their wide uptake locally, nationally and internationally, a number of ambitious demonstrator sites should be established for integrated infrastructure planning and testing of innovative infrastructure business models.

Recommendation 13: Establish full-scale urban demonstrator sites for integrated infrastructure planning and testing of innovative infrastructure business models.

1. What are the major economic and social challenges facing London and its commuter hinterland land over the next two to three decades?

Key messages:

- *As with all UK cities, London faces significant economic, social and environmental challenges over the coming years. Population growth, in absolute and relative terms, poses a particularly significant challenge in London and the wider city region.*
- *Governing and planning for growth and meeting future challenges, in London and the wider city region, requires effective institutional and administrative co-ordination between the Mayor of London, Greater London Authority and local authorities in the south east of England.*
- *No strategy will tackle all the challenges, and trade-offs between planning and infrastructure choices are inevitable. However, redressing the London-rest of UK balance by stimulating growth elsewhere will help alleviate many of these pressures in London.*

iBUILD researchers have been examining the governance of infrastructure funding and financing in the London mega city-region. Interviews undertaken as part of the study have sought to identify the major economic, social and environmental challenges facing London in relation to infrastructure.⁶ The overwhelming majority of interviewees have stated that the fundamental challenge facing London is how to ensure that there is adequate housing, transport, water, energy, communications and other infrastructure to accommodate and absorb the significant population growth that has taken place, and is projected to occur, within the administrative boundaries of London and the broader city region. In one interview, a stakeholder suggested that:

“Population growth requires the opening up of new locations for housing growth. There could also be the opening up of existing residential areas. All the accompanying infrastructure that is required to enable housing growth to be sustained is the number one challenge.”

Dealing with the implications of population growth poses profound questions about the planning, governance, funding, financing and operation of infrastructure across and within the London functional economic geography. There is limited, if any, formal strategic planning activity across the functional city-region, and there are noticeable differences in the institutional capacity, statutory responsibilities and funding of the Greater London Authority (GLA), London Boroughs and individual local authorities and Local Enterprise Partnerships (LEPs) in the south east of England outside London. The limited strategic planning capability at the interface of these organisations makes the case for long-term planning and securing public and private (particularly international) investment in infrastructure problematic. The Mayor of London, GLA and South East local authorities and LEPs are

⁶ Stakeholder organisations that have taken part in the iBUILD research, include: the Greater London Authority; Transport for London; London First; and the Department for Transport.

attempting to overcome these spatial challenges by working through a new voluntary ‘wider south east summit’ framework. These arrangements could offer some scope for project or programme-based ‘deal-making’ between different local authorities in the city region in an attempt to plan urban development collaboratively and to use geographical scale as a means of generating new investment and attracting private sector contributions in infrastructure in London and the wider South East. Continued institutional ‘reform’, in an attempt to overcome local administrative fragmentation, and improve urban economic performance⁷ is a noticeable feature of how many global cities are governed.⁸ The recent establishment of *Métropole du Grand Paris*, as well as current plans to manage the delivery of spatial and economic strategies within and across the Sydney ‘city-region’, illustrate how local and national actors continually attempt to co-ordinate and ‘improve’ the governance of large metropolitan areas.⁹

The other major economic and social challenges facing London and the wider city-region, include:

- Improving transport mobility and accessibility for people in London and the wider city region, for work and leisure purposes.
- For many employers, the issue of housing is of heightened significance because of the affordability crisis and some of the difficulties that companies face in recruiting and retaining staff in London. Ensuring that ‘doing business’ in London remains a viable proposition for international and national firms, which means preventing the cost of business (in terms of commercial rents) from becoming prohibitive.
- Providing sufficient brownfield sites in London and the wider city region for commercial and residential use, and that GLA, London Borough and local authority statutory plans are aligned and there is agreement upon what development is built where.
- Tackling poverty and low wages in London, and ensuring that transport infrastructure supports affordable access to job and training opportunities and addresses and does not exacerbate the problem of rising inequality in different parts of the city and city region.
- Managing the growing demand for health and social care services, as well as ensuring there is ‘quality’ early years and post-16 education for children and young adults.
- Creating and maintaining sufficient green spaces to underpin and support greater social equality and improved individual and collective environmental health and well-being.
- Addressing poor air quality and environmental degradation.
- Improving water quality and maintaining the effectiveness of flood defences.

⁷ Ahrend, R., Farchy, E., Kaplanis, I. and Lembcke, A. C. (2014) ‘What Makes Cities More Productive? Evidence on the Role of Urban Governance from Five OECD Countries’, *OECD Regional Development Working Papers*, 2014/05, Organisation for Economic Cooperation and Development: Paris.

⁸ Storper, M. (2014) ‘Governing the Large Metropolis’, *Territory, Politics, Governance*, 2(2): 115-134. Katz, B. and Bradley, J. (2013) *The Metropolitan Revolution: How Cities and Metros are Fixing our Broken Politics and Fragile Economy*, Brookings Institution Press: Washington D.C.

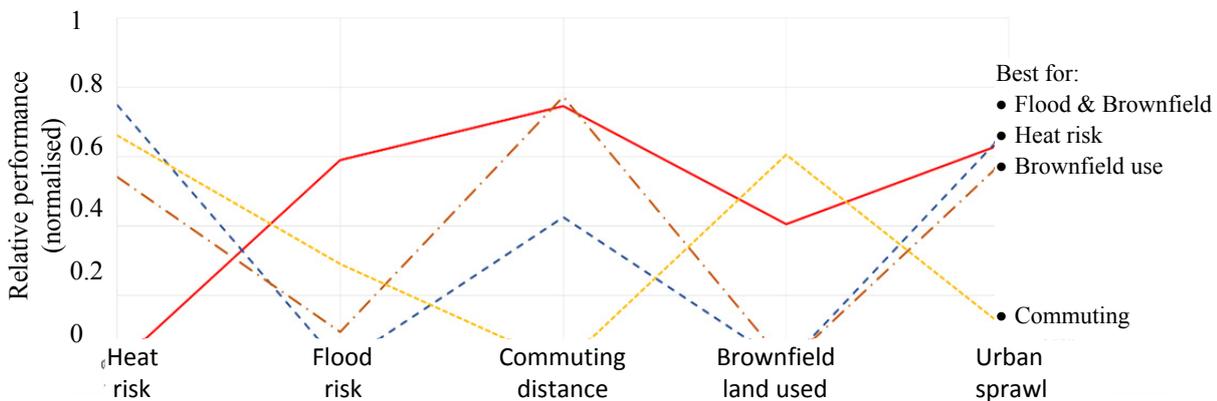

⁹ ‘Grand Paris’ will encompass an assembly of 209 councillors, drawn from local municipalities, and its area of jurisdiction will cover the densest part of the Paris region (covering approx. 7mn people). The new institution will incrementally take on new responsibilities, including urban planning and fiscal powers. By 2018, it will be headed by a new president. The Greater Sydney Commission is a new independent body, created by the New South Wales Government, which will be responsible for metropolitan planning in the Sydney metropolitan area, in partnership with State and local government – see:

<http://www.planning.nsw.gov.au/Plans-for-Your-Area/Sydney/A-Plan-for-Growing-Sydney/Greater-Sydney-Commission>

- Ensuring that London and the wider city region have the capacity and capability to fund and finance urban infrastructure now and in the future. Link to value capture in uplift from public investments and improving on the historically weaker efforts e.g. with Crossrail

It is rarely possible to satisfy all objectives, as is shown in Figure 1, where, for example, strategies that are good for managing flood risk can increase transport use and travel distance for commuters.

Figure 1: Tradeoffs between planning and infrastructure investment choices in London

Source: Caparros-Midwood *et al.* (2015).¹⁰

¹⁰ Caparros-Midwood D, Barr S, Dawson RJ (2015) Spatial Optimization of Future Urban Development with regards to Climate Risk and Sustainability Objectives, Risk Analysis. (also presented in 2nd UGEC conference, Taiwan: <http://ugec2014.squarespace.com/daniel-caparros-midwood>)

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2?

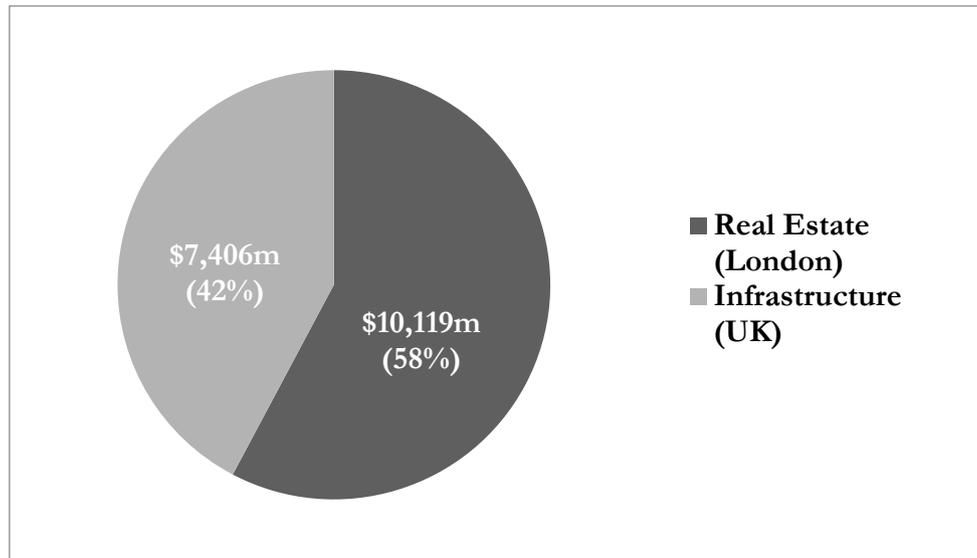

Key messages:

- *Transport infrastructure improvements led by Transport for London and other similar sponsors will increasingly be required to demonstrate their contributions to growth, jobs and housing development, beyond alleviating transport congestion.*
- *Private sector investors are more likely to invest in the early stages of transport schemes if they are part of a broader urban regeneration or development programme*
- *Central government will continue to play an important role in providing regulatory and/or financial backing for large-scale transport projects in London.*
- *Government financial support is also likely to form part of broader, multi-faceted funding packages.*
- *Small-scale interventions can play an important role in improving London's transport infrastructure.*

Under the leadership of Sir Peter Hendy, Transport for London (TfL) began to situate transport investment in a wider context and as an instrument that is measured for its broader impact above and beyond achieving journey time savings. TfL's corporate strategy and business plan have been written so that they identify and explain how individual investment transport infrastructure projects will contribute towards the economic growth and overall prosperity and performance of London. TfL has concluded that planning and investing in transport for London has to demonstrate the wider economic costs and benefits of investment.

Against this background, TfL and other transport infrastructure sponsors have framed Crossrail 2 as a specific intervention that could open up new housing sites and development opportunities as well as improving transport connectivity. This approach reflects the belief that there is a virtuous relationship between transport – housing – spatial planning and local/urban development. International sovereign wealth funds looking to invest in London's transport infrastructure will do so if there is a definitive revenue-raising urban regeneration or housing development scheme attached to a transport project, such as the Nine Elms development, which includes the Northern Line extension. The returns available in London real estate and property make investments in these assets more attractive to foreign investors than transport infrastructure alone (see Figure 2). Furthermore, major transport schemes will always require government-funding as they are often considered too risky for the private sector. Thus, national and local/city-regional governments will continue to play a major role in transport infrastructure planning and investment, especially in large metropolitan areas like London, despite the fact that investment markets are more buoyant in these places than in many other cities.

Figure 2: China foreign direct investment in the UK (2005-2014)

Source: Pinsent Masons and CEBR (2014).¹¹

In terms of future transport linkages, TfL, the Greater London Authority (GLA) and local authorities should recognise the importance of both radial and orbital transport connections in the London city region, as there are important economic units within and outside London's formal administrative boundaries. This requires economic and spatial plans to be aligned and to consider how London and the wider city region is set to develop in terms of population, housing and business growth. For example, in an illustration that the economic centre of London has been moving 'eastwards', TfL announced in January 2016 that it was re-zoning eight London Underground stations near Stratford and the 2012 Olympics site to the boundary of Zone 2 of the Underground.¹² Much of London's future growth is expected to be focused on the capital's Opportunity Areas, which will feature dense, mixed-use developments with high public transport connectivity – particularly in the east of London (Travel in London Report 8, 2015). TfL and the GLA are using the Opportunity Areas to shape and steer the London Plan and give it a clear linkage to economic strategies. Going forward, there will be a visible link in how transport is expected to transform the Opportunity Areas.

Atkins suggests that the focus on public transport improvements (such as rail and road capacity) could be strengthened in the London Infrastructure Investment Plan 2050 if priority was given to bus and cycle networks (to better connect outer London and are important assets for lower-income households)¹³ – helping to build and support a more inclusive and sustainable city region. While the remit of the NIC is on major transport schemes it is important to recognise that there are direct and indirect economic, social and environmental impacts from investment decisions that are based on small-scale interventions. There is also a need to focus on improving the existing transport network in

¹¹ Pinsent Masons and CEBR (2014) [China Invests West: Can Chinese Investment be a Game-changer for UK infrastructure?](#) Pinsent Masons and CEBR: London.

¹² Topham, G. (2014) 'East London tube, DLR and rail stations change zones', [The Guardian](#), Monday 4 January.

¹³ Atkins (2015) [Future Proofing London](#), Atkins and Oxford Economics: London.

London, building upon TfL's interest in whole-life asset management and benchmarking in support of improving performance and resource efficiency. We would, therefore, expect TfL and local highways bodies to look at how best to improve the maintenance and operation of the existing road network, which has seen increased congestion recently, particularly in parts of outer London. SMART technology can also help to manage performance, and TfL has made significant strides in gathering, analysing and deploying 'big data', but as recent events have demonstrated, even these assets have to be made more resilient to 'shocks'.¹⁴

We would anticipate that the strategic options for future transport investment in London would encompass, or at least benefit from, further rail devolution to London and the South East. TfL is looking to apply its existing operational experiences to suburban rail services, where, in some cases, there has been significant improvements. For example, the London Overground network, largely established since 2008, has seen a 321 per cent increase in journey stages between 2008 and 2014, on a like-for-like basis – reflecting the rapid development and enhancement of the network.¹⁵

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Key messages:

- *Crossrail 2 must better capture the value it delivers to the private sector, in particular through capturing the uplift of land and property value, and improving connections to major transport hubs.*
- *Crossrail 2 offers significant development opportunities and connectivity benefits, but at a projected cost of up to £32bn the case has to be made that this investment could not deliver better returns through a series of smaller scale projects in other UK regions.*
- *The Department for Transport, Transport for London and other major transport sponsors should heed the lessons of Crossrail, and consider the recommendations of the National Audit Office to ensure that Crossrail 2 and other large-scale projects deliver value for money for UK tax-payers where government grants have been included in funding packages.*

TfL estimates that Crossrail 2 will cost somewhere between £27bn and £32bn (with a 66 per cent optimum bias included), in 2014 prices and includes the cost of new trains and Network Rail works. In evidence to the London Assembly, PwC suggested that the estimated cost of Crossrail 2 could, if the optimism bias was reduced to a 'more realistic' 44 per cent, be around £20bn.¹⁶ The project intends to relieve demand on London's transport network, and to provide capacity for an extra 270,000 people to access central London at peak times by increasing the number of trains from major destinations across south west London and Surrey (including Wimbledon, New Malden, Kingston and Epsom) and across north east London and Hertfordshire (including Tottenham Hale, Waltham Cross, Cheshunt and Broxbourne). A London Chamber of Commerce poll found that 44 per cent of London businesses saw Crossrail 2 as their top transport priority.¹⁷

The cost of Crossrail 2 is significant, roughly twice the annual capital investment budget spent in London (£15bn), and represents approximately £376m for every mile of the 85 miles of proposed line. The Chancellor of the Exchequer, George Osborne, has indicated that at least 50 per cent of the funding for meeting the cost of Crossrail 2 should come from private sources, which some business organisations have suggested is feasible.¹⁸ While some costs could be saved on the rolling stock for Crossrail 2, further costs are expected to be found during the detailed design stage of the route. A premium will be placed on TfL identifying further savings given that businesses believe that the high cost of transport projects in London is a significant barrier to the delivery of infrastructure improvements.¹⁹

¹⁶ Minutes of evidence available at: <https://www.london.gov.uk/moderngov/documents/s47535/Minutes%20-%20Appendix%20-%20-%20Transcript%20Crossrail%202.pdf>

¹⁷ Further details on the London Chamber of Commerce poll available at: http://www.londonchamber.co.uk/lcc_public/article.asp?aid=7197

¹⁸ London First (2014) *Funding Crossrail 2: A report from London First's Crossrail 2 Task Force*, London First: London.

¹⁹ According to business surveyed in the London Chamber of Commerce poll.

In putting together the funding and financing package for Crossrail 2, the lessons of Crossrail [1] should perhaps be heeded. In particular, Crossrail 2 will be scrutinised for how it captures private land and property value uplift that is expected to be generated given the experiences of Crossrail [1]. Researchers have forecast total house price growth of 13 per cent, between 2013 and 2018, for residential properties located near Crossrail stations, with up to 20 per cent growth in Central London, in addition to underlying capital growth.²⁰ With criticism that the taxpayer could have benefited more from Crossrail in the form of greater tax receipts on developments near proposed stations, it has been suggested that more targeted developer contributions should form part of the funding package for Crossrail 2.²¹ Furthermore, Crossrail does not connect with other recent transport investments such as the Eurostar station at St Pancras or Terminal 5 at Heathrow, and it does not necessarily serve the areas of greatest potential expansion in and around London. Consequently, the final agreed route of Crossrail 2 will need to connect or integrate effectively with other existing or proposed transport infrastructure assets, such as the HS2 terminus in Euston, without producing negative impacts for local residents and businesses in places such as Camden, which brings into focus once again the governance and spatial planning implications of co-ordinating major transport infrastructure investment in London and the wider city-region.

The broader industry contribution of Crossrail is, however, also significant, particularly in the area of skills, where the Tunnelling and Underground Construction Academy, funded primarily by Crossrail, is training the next generation of future engineers. Such inputs should ensure that there are legacies of improved efficiency and productivity in future large-scale [underground] transport infrastructure projects similar in nature to Crossrail.

With the current public consultation for Crossrail 2 closing on 8 January 2016, TfL will have, at its disposal, a large volume of evidence and opinion, submitted as part of the consultation exercise. In addition, the Crossrail 2 Growth Commission's call for evidence, which closed on 23 December 2015, is also expected to be an important source of information, data and evidence that TfL and partners will have as they seek to reflect upon how best to strengthen the benefits and reduce the costs of Crossrail 2. In the current austere times, and with demands for more transport investment in the regions and nations outside of London, the economic, social and environmental case for Crossrail 2 will come under ever-closer scrutiny, and the project will need to demonstrate that it can be delivered in an effective and cost-efficient manner. TfL and the other sponsors of Crossrail 2 will no doubt be guided by the findings of the National Audit Office in its 2014 report on Crossrail, to see what lessons that can be applied in the project development and implementation of Crossrail 2. In considering the costs and benefits of Crossrail 2, it is useful to reflect upon the following recommendations in the NAO's review, which were directed specifically at the Department for Transport (DfT), and outlined a series of steps to strengthen tax-payer 'value for money' from future major transport projects:²²

- Do more to secure private sector funding contributions. The Department should ensure that when it negotiates contributions to projects from businesses and other organisations, these are based on

²⁰ CBRE (2013) *Crossrail: The Impact on London's Property Market*, CBRE: London.

²¹ Pickford, J. and Allen, K. (2014) 'Crossrail a shot in the arm for London property developers', *Financial Times*, 6 March 2014.

²² NAO (2014) *Crossrail, Report by the Comptroller and Auditor General*, National Audit Office: London, p11.

robust and realistic calculations of the benefits to business. The Department should also work to understand private sector funders' interests in its projects and how these may affect the certainty of funding.

- Consider how to achieve greater continuity in departmental officials' oversight of major programmes. The Department should identify how it will manage staff assignments to its various programmes, ideally to appoint officials for longer periods, and to manage the 'handover' process, where necessary, to achieve a smooth transition.
- Monitor all costs on major programmes including development, start-up and sponsorship costs so that it can develop an understanding of the true costs of major programmes, to help it keep these costs under control. We would expect all government departments to do this on their major programmes.
- Ensure that programmes have sufficient cash available to provide security and flexibility to the delivery body, while minimising opportunity costs.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Key messages:

- *iBUILD research has identified a range of funding and finance schemes (Table 1) suitable for large projects, each with different advantages and disadvantages.*
- *TfL's strategic oversight in London, compared to other transport governance structures in the UK, provides them with far greater opportunity to capture and utilise value.*
- *TfL and other transport infrastructure sponsors in London will be encouraged to identify and adopt more 'innovative' funding and financing packages to support transport infrastructure investment. However, such packages are likely to be based on greater speculative forms of urban development and therefore may increase the financial risks for TfL and other institutions.*

Against the background of a reduction in central government grant funding to cover its operational budget, TfL has been encouraged to be more 'innovative' in how it funds and finances transport infrastructure in London. According to one DfT official:

“We've strongly encouraged TfL to get more savvy in the way it generates income from its estate, for example, so it's got a very ambitious commercial development programme now, which covers everything from, the sponsorship deals for Santander cycles to advertising at tube stations, to flogging off the old headquarters at 55 Broadway, which is all going to be turned into luxury homes and so on...” (iBUILD research interview with DfT official, September 2015).

There is a strong push for TfL to widen and deepen its engagement in land and property development in order to generate new revenues to fund transport infrastructure and/or services. Consequently, there are few, if any, projects in TfL's capital investment plan that are not linked to economic development, employment or housing. TfL believes that this will enable the organisation to leverage additional private and public funding. While grant funding is still the preferred mechanism, in the current fiscal climate this is increasingly testing, although for major transformational projects central government is still expected to commit resources as part of overall funding packages. While TfL is looking to become 'self-sufficient', the organisation believes that 'transformational' infrastructure schemes will require alternative funding mechanisms, which draw upon finance from a range of different sources.

As infrastructure becomes funded and financed in increasingly financialised ways, different practices, tools, instruments and governance arrangements are being modified or constructed in order to fund and finance local infrastructure. A variety of different infrastructure funding and financing practices have emerged in recent years, many of which blur and/or straddle traditional notions of public-private boundaries (Table 1). We would expect TfL and its partners to adopt some of these practices to suit specific projects and geographical contexts, subject to appropriate fiscal powers and capability being

evident. Some transformative transport schemes will require national government financial backing, in the form of direct grant, infrastructure guarantee or through borrowing. However, the likelihood is that international and national private infrastructure financiers will be reluctant to invest in the early phases of the infrastructure life-cycle of major transport projects:

“Some commentators cite that a “wall of money” from Sovereign Wealth Funds, Infrastructure Funds, Pension funds and other similar investors is available to invest in infrastructure, and that this provides evidence that projects such as Crossrail 2 could be privately financed. While there is no doubt that these investors are keen to invest in infrastructure, Crossrail 2 is unlikely to meet many of their investment requirements. The size of the project, the construction risk, the demand risk and the likely reliance on non-patronage revenues to pay the bulk of the project means that, without direct government guarantees, such investors are unlikely to invest in Crossrail 2”.²³

We would recommend that the NIC examines the 2014 report produced by PwC, which considered the range of different mechanisms and practices that could be used to fund and finance Crossrail 2.

Land (or property) value capture mechanisms offer a potential funding source for Crossrail 2. However, in the iBUILD case study of the governance of infrastructure funding and financing in London, officials that were interviewed were mindful of the ‘political difficulties’ of increasing residential taxation, despite recognising that value capture was the only ‘fair means’ of ensuring that those who benefitted most from Crossrail 2 made the biggest financial contribution. Increasing fares to generate extra revenues is also problematic given commitments by the current Mayor of London to ‘freeze fares in real terms’, and other statements by mayoral candidates. Consequently, additional financial options are being explored, including the feasibility of extending the hypothecated business rate supplement tax that has been funding Crossrail [1].

Finally, TfL and other infrastructure sponsors should consider whether there are alternative quick and cost-effective wins from smaller schemes that could support London’s transport infrastructure and make the overall network more efficient. TfL could perhaps look at whether it is possible to make improvements, such as bringing back sections of unused rail line, to generate additional benefits, as has happened with the London Overground. The engineering consultancy firm, Atkins, makes a similar argument, suggesting that:

“The 2050 [London Infrastructure Investment] Plan rightly makes some ambitious plans for infrastructure provision. However, consideration should be given to whether investment in a greater number of smaller scale interventions could achieve wider benefits”.²⁴

²³ PwC (2014) *Crossrail 2: Funding and Financing Study*, PwC: London, p7.

²⁴ Atkins (2015) *Future Proofing London*, Atkins and Oxford Economics: London, p 88.

5. How have metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

Key messages:

- *Preparation of the London Infrastructure Investment Plan 2050 was an important step in defining strategic priorities, and echoed similar arrangements in other leading UK and international cities. Integrating this with other planning processes provides further opportunities.*
- *A review of over one hundred infrastructure business models by the iBUILD research team highlights the potential diversity of approaches that should be explored to capture more value from local and urban infrastructure.*
- *The ability of London to address its economic, social and environmental challenges, by implementing a wider range of transport infrastructure funding and financing mechanisms and practices, similar to those employed in other international cities, will depend upon the UK government granting London greater fiscal autonomy to raise and retain local tax revenue and increase borrowing for capital investment purposes.*
- *There is a case for a systematic study to be commissioned of how these issues are being tackled in other global cities. Sydney is making new moves to tackle these infrastructure and spatial planning challenges, as is New York and Paris, and there may be common lessons to be learned, which could benefit London.*

We welcome the fact that London has published its first infrastructure investment plan, along similar lines to strategies that have been produced and implemented by other global cities, such as New York, Tokyo and Seoul as well as other UK cities (e.g. the Newcastle-Gateshead Infrastructure Delivery Plan). Lessons from international practice suggest it is important that the London Infrastructure Investment Plan and statutory London [Spatial] Plan are closely aligned, and that the infrastructure plan also fits with local development and planning frameworks in and around the London city region. This requires close engagement, even co-production, between a wide-range of different institutions and actors. iBUILD research has highlighted the benefits of taking a whole systems view to infrastructure by considering integrating with spatial planning policies. For example, reducing demand for services through ‘hidden infrastructure’ such as investment in efficiency measures and demand management strategies reduces consumer bills, frees up capacity to support growth and regeneration, and defers the need for expensive capital investment in new infrastructure (e.g. for new power stations and water treatment works). The National Infrastructure Plan, for example, sets out a pipeline of £65bn investment in energy generation and £45bn investment in energy networks over the coming years. Yet, investing a third of this in energy efficiency measures over the next four decades could free up 12 per cent headroom in generation capacity.²⁵

²⁵ Gouldson A, Kerr N, Millward-Hopkins J, Freeman MC, Topi C & Sullivan R (in review) Innovative Financing Models for Low Carbon Transitions: Exploring the case for revolving funds for domestic energy efficiency programmes. Based on

In terms of funding and finance, London currently spends around 5 per cent of its annual Gross Value Added (GVA) on capital investment while its international competitor cities spend between 10-12 per cent.²⁶ One of the other challenges facing London is that it is still required to secure central government financial or regulatory agreement for major transport infrastructure on a project-by-project basis. And unlike other global city leaders, the Mayor of London and London Boroughs have limited powers to raise their own local revenue (Table 2).

Table 2: Municipal operating expenditures and taxes per capita

	Municipal Operating Expenditures per capita (£)	Municipal Taxes (local and shared taxes) per capita (£)
London – GLA plus boroughs (2011)	3,199	476
Berlin (2010)	4,910	2,570
Frankfurt (2010)	3,577	2,140
New York (2011)	4,561	3,078
Madrid (2009)	1,267	490
Paris (2011)	2,699	1,896
Tokyo (2010)	3,301	2,312

Source: Slack (2013: p5)

On the subject of fiscal decentralisation and global cities, we would direct the NIC towards two useful studies that have undertaken detailed analysis of how London compares to other global cities and city regions when it comes to planning, funding and financing urban infrastructure. The first reference is a working paper written by Enid Slack (University of Toronto) which was commissioned by the London Finance Commission.²⁷ The paper offers an international comparison of the current methods of raising revenues in seven global cities -- London, Paris, Berlin, Frankfurt, Madrid, Tokyo, and New York -- and evaluates the costs and benefits associated with greater devolution of revenue tools to the Greater London Authority (GLA), with Slack suggesting that:

“London would benefit from greater fiscal autonomy – access to a mix of taxes and the ability to set the tax rates. A mix of taxes would give it the flexibility it needs to respond to changing economic circumstances. Local fiscal autonomy and, in particular the ability to set tax rates, is also important for accountability: governments that raise their own revenues and set their own

an earlier working paper: Gouldson A, Kerr N et al. (2014) *Revolving funds for infrastructure business models*, iBUILD Working Paper, iBUILD, Newcastle University: Newcastle upon Tyne.

²⁶ Based on statistics set out by Professor Tony Travers, London School of Economics, in a presentation given to the ‘Developing a Long Term Infrastructure Plan for London’ seminar, Monday 16 December 2013, City Hall, London.

²⁷ Slack, E. (2013) *International Comparison of Global City Financing: A Report to the London Finance Commission*, University of Toronto: Toronto.

taxes to meet local expenditure needs tend to be more responsible and more accountable to taxpayers.²⁸

The second report was published by PwC in 2014, and considers the various funding and financing mechanisms and practices that could be deployed to deliver investment in Crossrail 2, and includes a comparative analysis of how transport infrastructure projects are funded and financed in the following cities: Paris; San Francisco; Atlanta; Copenhagen; New York; Greater Toronto; Chicago; Melbourne and Sydney.²⁹ In the report, PwC concludes that London would find it problematic to replicate some of the funding arrangements employed in other international cities without greater fiscal autonomy:

“Our review of funding approaches used internationally shows that many other cities use a range of property and other taxes to fund transport infrastructure. On the face of it, similar levies implemented in London would be capable of funding a substantial part of the funding requirement for Crossrail 2. However, when we have looked at how such levies have been implemented, many appear to rely on enforcement systems that have evolved over time and in part rely on there being a general level of fiscal devolution across all local or regional authorities. This is several steps away from where London is now in terms of progress towards the first steps of fiscal devolution”.³⁰

Alternative and integrated infrastructure business models

Business models take into consideration different governance, but must also consider the wider infrastructure system that comprises (Figure 3):

- *physical artefacts* – includes the physical links, nodes and components of infrastructure systems such as roads, bridges, pipes and cables;
- *processes* – includes actors, institutions, management, regulation, protocols and procedures that govern the infrastructure over its lifecycle;
- *resources* – includes people, vehicles, water, electricity and data that are conveyed by the physical artefacts and the materials used in the construction of the artefacts; and
- *services* – such as warmth, mobility, sanitation, transportation, welfare services and communication that benefit a wide range of users.

Infrastructure is therefore the artefacts and processes of the inter-related systems that enable the movement of resources in order to provide the services that mediate (and ideally enhance) security, health, economic growth and quality of life at a range of scales.³¹ Moving beyond a narrow or solely economic view and distinct from the world of more conventional goods and services, an infrastructure

business model therefore describes how infrastructure systems create, deliver and capture economic, social and environmental values over the whole infrastructure life cycle.³²

Figure 3: A systems view of infrastructure

Source: iBUILD (2015: p5).

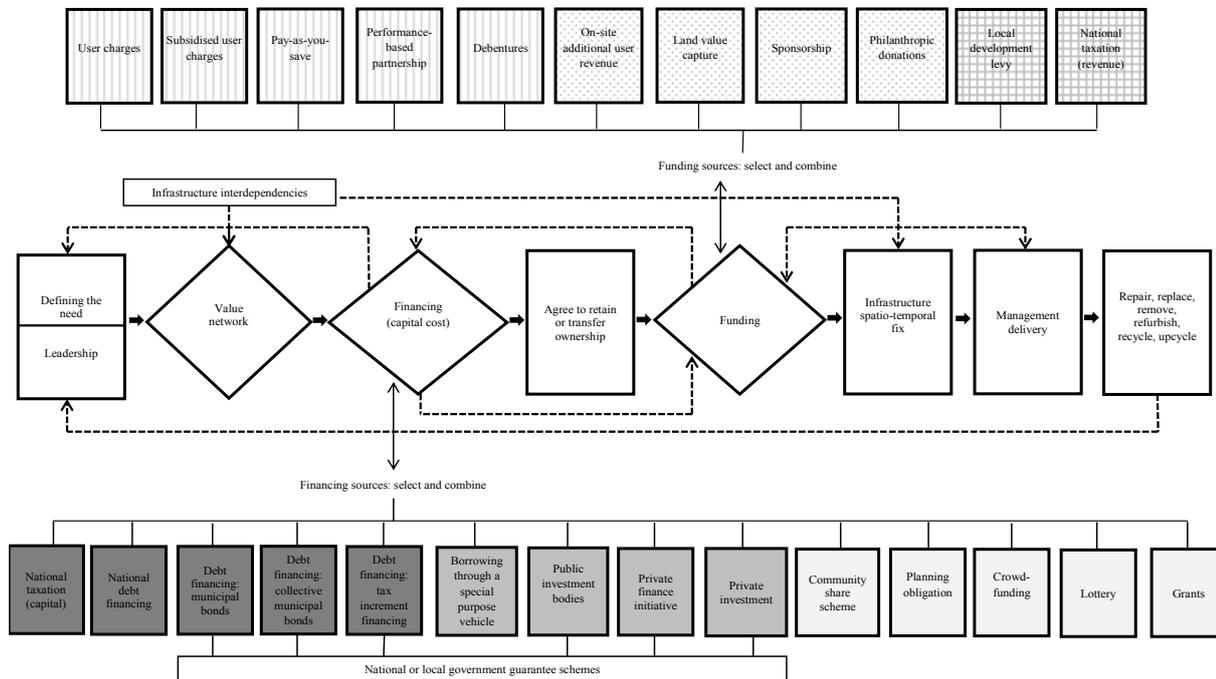

iBUILD has undertaken a review of over hundred UK and international local infrastructure business models, both traditional and non-traditional, across all infrastructure asset classes.³³ The business models are diverse. Value creation includes social, economic and urban regeneration outcomes as well as direct outputs in terms of service supply. International comparison has illustrated how the development of business models from niche to established mainstream models reflects the regulatory, political and socio-economic context (Bryson *et al.*, in review).³⁴ For example, the success of municipal decentralised energy supply in Denmark and subsidy-supported business models for local energy supply in the UK.

³² Bryson JR, Pike A, Walsh CL, Foxon T, Bouch C & Dawson RJ (2014) *Infrastructure Business Models*, iBUILD Briefing Note 2.

Figure 4: Conceptual Framework of Local Infrastructure Business Models

Source: Bryson et al. (in review).

Developing and implementing alternative approaches provides some benefits, but as noted above, our infrastructures are increasingly interconnected and some of the most promising opportunities are from thinking about delivering what people really require i.e. warmth, light, mobility etc. rather than electricity, gas, roads. This can help identify business models that deliver efficiencies across multiple ‘traditional’ sector boundaries. A rapidly emerging interdependence is between electricity and transport infrastructure – most notably uptake of electric vehicles (EVs). Coupled analysis of energy and transport systems models, has demonstrated that distribution networks could accommodate higher growth in electric vehicles than previous studies have suggested. Exploiting the geographic spread and different timings of EV charging can limit the impact on power infrastructure. Distribution network operators should collaborate with new market players, such as charging infrastructure operators, to support the roll out of an extensive charging infrastructure to make both networks more robust.³⁵

A well-established demonstration of the value of integrated infrastructure thinking applied to an industrial park – now an industrial ecosystem – is the closing of material and energy loops locally with integrated infrastructure in Kalundborg, Denmark. Since 1972, this industrial park has evolved from a single power station into a cluster of companies that exchange materials and energy for mutual benefit as by-products from one business are often inputs for others. For example, treated wastewater from a refinery is used to cool a power station which in turn provides steam for the refinery and a pharmaceutical plant. Surplus heat from the power station is also used for warming nearby homes and

³⁵ Neaimeh M, Wardle R, Jenkins A, Hill GA, Lyons P, Yi J, Huebner Y, Blythe PT & Taylor P (in press) A probabilistic approach to combining smart meter and electric vehicle charging data to investigate distribution network impacts, *Applied Energy*.

businesses. This has led to substantial annual savings of resources and costs – for example, a reduction in water consumption of 3.3mn m³/year, savings of \$15m from resource sharing and far larger savings by sharing infrastructure have been reported – highlighting how integrated infrastructure business models can produce substantial savings.³⁶³⁷

There are many potential ways of organising and regulating such interactions to create efficiencies. For example, in 1887 in Indianapolis, local civic leaders established a natural gas company as a Public Trust, with an aim to “create the greatest long-term benefit for customers and communities”. Today, the Citizens Energy Group owns and operates a large portfolio of physical infrastructure assets that deliver multiple services including energy, water and wastewater for 800,000 people and thousands of businesses in the Indianapolis area. This has provided community services that are entirely compatible with good financial management. The group was awarded a top rating (MIG 1) by Moody’s credit rating agency in 2014, a reflection, in part, of the strength of the company’s infrastructure business model.³⁸ By recognising the opportunities from the interdependencies of modern infrastructure, and explicitly designing this into our energy and other systems, this not only offers opportunity for alternative business models but also can be used to deliver flexible infrastructure systems that can enhance resilience.³⁹

Rail Investment Priorities in London & the South East

This document sets out the author's personal view on possible methods for infrastructure investment prioritisation, built on his experience having been involved in Signalling Supply, Network Rail Major Programmes, and now the Crossrail Programme.

The author has a number of feasibility schemes worked up in more detail, and would be more than happy to share his personal views on incremental investment opportunities targeted at maximising the use of existing rail corridors, if the panel should wish to pursue this.

How should Rail Investment in London be prioritised?

New major programmes, Crossrail, HS2 and Crossrail 2, creating new railway corridors, in the author's view, should be complemented with work prioritised on two bases;

1. Maximising the use of existing rail corridors, such that each two-track commuter corridor is optimised to carry up to 24 tph of up to 12-Car trains in each direction – i.e. to move up to on average 1,500 people x 24 trains per hour = 36,000 people per hour. Investing in existing corridors in priority to complement and integrate with the new major programmes such as Crossrail, HS2, and Crossrail 2 – e.g. improving the feeder networks to these new schemes.
2. Optimising the development of London by considering transport projects as an integrated part of planning permission for new property development, and not allowing existing railway corridors to be constrained. In fact using developer's to assist in the incremental expansion of existing railway corridors to complement the new major schemes.

Which existing railway corridors are constrained, and could be expanded?

Existing railway corridors are typically constrained by not having enough platform capacity to support maximum train volumes, and / or are unable to support longer trains. Examples include:

1. 2 track corridor (The DC Lines) alongside West Coast Main Line between Euston and Watford Junction, used by 6-car Underground trains, and short formation London Overground trains at less than 10 trains per hour in total. The proposed link from the Crossrail scheme at Old Oak Common onto the West Coast Main Line could be fed from services using incrementally expanded DC Lines, releasing capacity at Euston by diverting West Coast suburban services through into Crossrail train paths. A win-win for existing corridor usage maximisation, and an enabler for a more major Euston Master Plan (for example).
2. 2 track corridor (The East London Line) connecting the Brighton Lines to the North London Line, but only used by up to 5-Car London Overground trains, with stations that are too closely spaced, and a service frequency of around 15 trains per hour.
3. 4 track corridor between Loughborough Junction and Blackfriars, planned to be used by just 8 trains per hour for through Thameslink services (mainly 8-Car) from 2018, and having capacity only for 8tph of up to 12-Car terminating services at Blackfriars. i.e. 16tph in total for the 4-track corridor. (Constrained further south by Herne Hill and Tulse Hill approaches which could be changed through combined investment in development in these areas)
4. Brighton Main Lines (BML) corridor, serviced at East Croydon by 8 tracks toward London Bridge and London Victoria, and therefore should be capable of fielding up to 80 trains per hour in each direction (considering some services need to service West Croydon), however with only 6 through platforms at East Croydon, a 4-track railway corridor south of there, and a series of flat junctions and inadequate numbers of platforms for splitting and joining

further south, the BML is constrained to a probable maximum capacity of about 40 tph, or half its potential.

5. 4-track (but 3-track in places) North London Line corridor between Dalston Junction and Euston area, reserved for freight traffic to await paths toward Willesden, and a small number of short London Overground trains per hour passenger services. Could service diversion of traffic from the south end of the West Coast DC Lines corridor, linking in a Thameslink-style fashion through to the East London Line, and the Brighton corridor.
6. Great Northern lines terminating in Moorgate – could be extended through tunnels via London Bridge to link to the Bright Main Lines, therefore delivering another 24tph North South corridor opportunity. Tunnelling activity currently being undertaken in the Bank area might be quite easily extended in the immediate future to create new link required.

What is typical in terms of missed Development opportunities?

In London and the South East up until 2015, with the exception of the new Crossrail development, property development has included very little consideration of the transport opportunities that could be released for the railway corridor. Examples include:

1. The South Bank development at Blackfriars, in which a large residential tower block at the south station will for the next 30 to 50 years block any possibility of access to the remaining old railway bridge piers standing in the River Thames, which could have been used to provide two more terminating platforms for trains from the south arriving at the newly expanded Blackfriars Station. The new towers even include cut-out corners at higher levels for roof garden spaces, yet have no cut-out at bridge level for the railway.
2. The new development at Elephant and Castle has no provision for terminating platforms that could logically have provided a well-connected new southern London Terminus to augment Blackfriars sitting on one of the most underutilised 4-track railway corridors in London.
3. Finsbury Park residential development adjacent to the station on the ECML that is proven (December 2014 debacle) to require major upgrade to increase interchange connectivity.

How could incremental railway corridor improvements be sized and optimised to support new build railway projects?

Railway corridor improvements could be sized and optimised along the following broad rules:

1. Platforms could be extended generally to accommodate 12-Car trains on most suburban lines serving London
2. Where possible, terminal platforms supporting around 4tph per platform face, should be replaced by Through Connections. At Through Platforms with limited interchange, 24tph in each direction can be accommodated with modern rolling stock using ATO (similar to Thameslink Core Area, and Crossrail Central Operating Section), and 18tph in each direction if driven manually – therefore a huge increase on usable corridor capacity. At large scale interchange stations such as London Bridge and East Croydon, 18tph with ATO, and 15tph manually driven would be more supportable timetable planning rules.
3. Railway corridor incremental improvements could be optimised to support and divert commuter numbers away from the places that are being developed in the new build railways – e.g. diverting traffic away from Euston while Crossrail 2 and HS2 are built. I.e. a similar approach to that used when diverting Thameslink traffic from London Bridge to Blackfriars, but on a more effective and larger scale.

4. The application of Digital Railway techniques to increase capacity (as used on the Thameslink Core Area to give +4tph under ATO / ETCS) should only be considered feasible where successive flat junctions and constrained platforms have first been addressed. E.g. with successive flat junctions on the BML for example, it is the author's personal view that it is not possible for Digital Railway techniques to make a large increase in the overall train flow rates, as all that is achievable in practice is bunching up between successive flat junctions and stations.

Examples of incremental improvements for Brighton Main Line corridor:

The following scenario of prioritised incremental railway corridor improvements to support and maximise the usage of the Brighton Main Line gives one example of the sort of schemes that the author would propose:

1. Provision of 6 new platform roads underneath the existing East Croydon Station served exclusively by the London Bridge corridor. i.e. existing above-ground station serves the Victoria corridor only, and underground serves London Bridge.
2. South of East Croydon station, widen the railway corridor to provide for the fly-down connections to the new underground station at East Croydon, thus creating a 6-track approach from the south to both upper and lower platforms. Remodel the junction south of South Croydon station, so as to provide a 50mph grade-separated junction to the East Grinstead lines, and two lines sweeping alongside the allotments to provide a 6 track approach through Purley Oaks, south towards Purley.
3. At Purley, provide 6 platform faces and a 4-track railway corridor toward Coulsdon South for slow-line services, with no platform faces on the Fast Lines.
4. At Coulsdon South provide a 4-track railway corridor in place of the current 2-tracks through the station; 2 non-stopping relief lines in the centre, and moving the platforms to the outside of the corridor. (Fast lines remain unchanged). Relief lines converge just south of the station to run through the deep cuttings and tunnel – i.e. 4-track corridor remains through towards Merstham and Redhill.
5. At Merstham, expand the station to have four platform faces on the Slow Lines, utilising the unused land currently sitting between the Fast and Slow Lines.
6. At Redhill, expand the station to have five platform faces – a new Tonbridge platform to the east of the current station built over the current post office depot, as well as the planned Platform 0 on the west of the station serving the Reigate lines.
7. Provide a grade-separated junction between the Fast and Slow Lines just south of Redhill, before Earlswood Station. Also provide a 12-Car central turn-back platform between the Down Slow and Up Fast at Salfords station, for use during perturbation.
8. North of Gatwick Airport provide a wider northern throat with a 6-track approach, and grade-separated cross-over to allow routing of trains between the Fast and Slow lines to and from the London direction.
9. At Three Bridges, provide 6x12-Car platforms, re-building the currently disused western-most platform face for Up trains from the Horsham lines. Move the siding north of Three Bridges to the centre of the layout between the Fast and Slow Lines to provide a turn-back facility for cross-corridor Depot moves, and provide a grade-separated junction between the Horsham lines and the Brighton Lines north of the turn-back siding.
10. Extend the East Grinstead lines south through the Heritage Bluebell Railway corridor, to Horsted Keynes, and then re-build the dismantled railway between Horsted Keynes and Haywards Heath to re-join the Brighton Main Line. This will provide a cheaper alternative to

BML2 proposals via Lewes, and even allowing for heritage railway traffic, a 2-track corridor extension from East Grinstead could easily support the additional trains envisaged to flow to Brighton in the BML2 scheme. In effect this creates a 4-track railway corridor as far as Haywards Heath on the Brighton Main Line, with 2 tracks via Balcombe and 2 tracks via East Grinstead.

11. Widen the railway corridor to 4-tracks south of Haywards Heath to Wivelsfield, and grade-separate Keymer Junction and remove the level crossing on the Lewes lines by lowering these tracks to pass under the road.
12. While leaving just two tracks through the corridor via Burgess Hill and Hassocks, reinstate the fourth platform at Preston Park, and provide a grade-separated junction north of this station, thus allowing trains from Hove to exclusively serve the 2 western-most platforms, and trains to and from Brighton to exclusively serve the 2 eastern-most platforms.
13. Widen Brighton station by providing 2 new platforms on the eastern-most side where the multi-storey car park is sighted today, providing an increased car-parking capacity below the new platforms.
14. Widen the Brighton throat to allow more flexible approaches, to maximise use of the improved 2-track corridor toward London.

Summary

This document gives a personal view of the author as to how investment in incremental schemes to release capacity in existing railway corridors might be used in an incremental way to feed and integrate with the new major programmes that are proposed in the London Area such as Crossrail and Crossrail 2, as well as the southern end of the HS2 programme.

While the examples quoted above obviously do not work in isolation, the author has thought through a pattern of works and outline feasibility plans which if the panel had time, and was minded, he would be very pleased to discuss in more detail.

It is hoped that sufficient detail has been included herein to give visibility of an overall philosophy that could be utilised in planning and prioritising investment works.

WESTLINK : PROPOSED NEW CROSS-CAPITAL ROUTE

London has historically been served by more main line terminus stations than any other major city, and this has had, and continues to have, huge implications for cross-city connectivity. The major congestion and delays suffered by passengers as they are forced disembark from main line train to already packed Tube train have provided the impetus for development of new cross-city rail routes such as Thameslink, the East London Line and CrossRail (currently under construction). Collectively, these cross-capital lines will have a transformational effect upon London's rail connectivity, and planning is already in progress for the next project, commonly known as CrossRail 2.

CrossRail 2 has grown out of the original proposal for the 'Chelsea-Hackney Tube', first put forward in the 1970s. It is likely to comprise a 'heavy rail' route linking the South Western Main Line near Wimbledon with the West Anglia Main Line near Clapton, possibly with a branch towards Alexandra Palace. The Wimbledon - Clapton trunk route will require around 28km of tunnel, and 9 new deep-level underground stations; a project cost of £15 billion has been predicted. The impetus for CrossRail 2 has recently increased, owing to the congestion likely to arise with the projected development of Euston as the London terminus for HS2. With only the Northern and Victoria Lines available to disperse incoming passengers, the projected alignment of CrossRail 2 has been amended to include a new stop at Euston.

Although CrossRail 2 will undoubtedly bring major connectivity benefits for London, it should not be regarded as the only option to relieve congestion at Euston, or to improve cross-city connectivity on a south-west/north-east axis. This paper puts forward the alternative 'Westlink' proposal for a core route linking Waterloo, Charing Cross and Euston that will deliver far greater connectivity than CrossRail 2, for a fraction of the tunnelled length (and therefore cost).

CLC1 : PROPOSED 'CROSSRAIL 2' CROSS-CAPITAL ROUTE

The 'regional' heavy rail option for CrossRail 2 is shown superimposed onto central London's local rail network. All the length shown on the plan will be in deep-level tunnel, with underground platforms at all stations. As previously noted, around 28km of tunnel (twin bore) and 9 underground stations will be required.

CLC2 : PROPOSED 'WESTLINK' CROSS-CAPITAL ROUTE

Westlink's core section - comprising an elevated connection from Waterloo Station to Charing Cross river bridge, an underground route from Charing Cross to Euston, and a further northward tunnelled extension to Gospel Oak - will allow the Richmond-Waterloo, Bromley-Victoria (via the redundant Eurostar curve at Nine Elms) and Orpington-Charing Cross lines to connect to the Euston-Watford and Gospel Oak-Barking lines. A link to the West Anglia main line at Tottenham Hale will effectively replicate the regional functionality of CrossRail 2. 6 main line routes will be connected, for a total tunnelling requirement of less than 5km.

CLC3 : 'WESTLINK' PROPOSAL INTEGRATED WITH OTHER LOCAL RAIL SCHEMES

Westlink will be fully integrated into London's local rail network. Interchanges are proposed at Queenstown Road / Nine Elms (also serving the projected Nine Elms development), at Kentish Town West (for North London Line), at Harringay (for Thameslink Great Northern), and at Harlesden (for CrossRail extension to Chiltern).

CLC4 : WESTLINK & CROSSRAIL 2: ROUTEING COMPARISONS

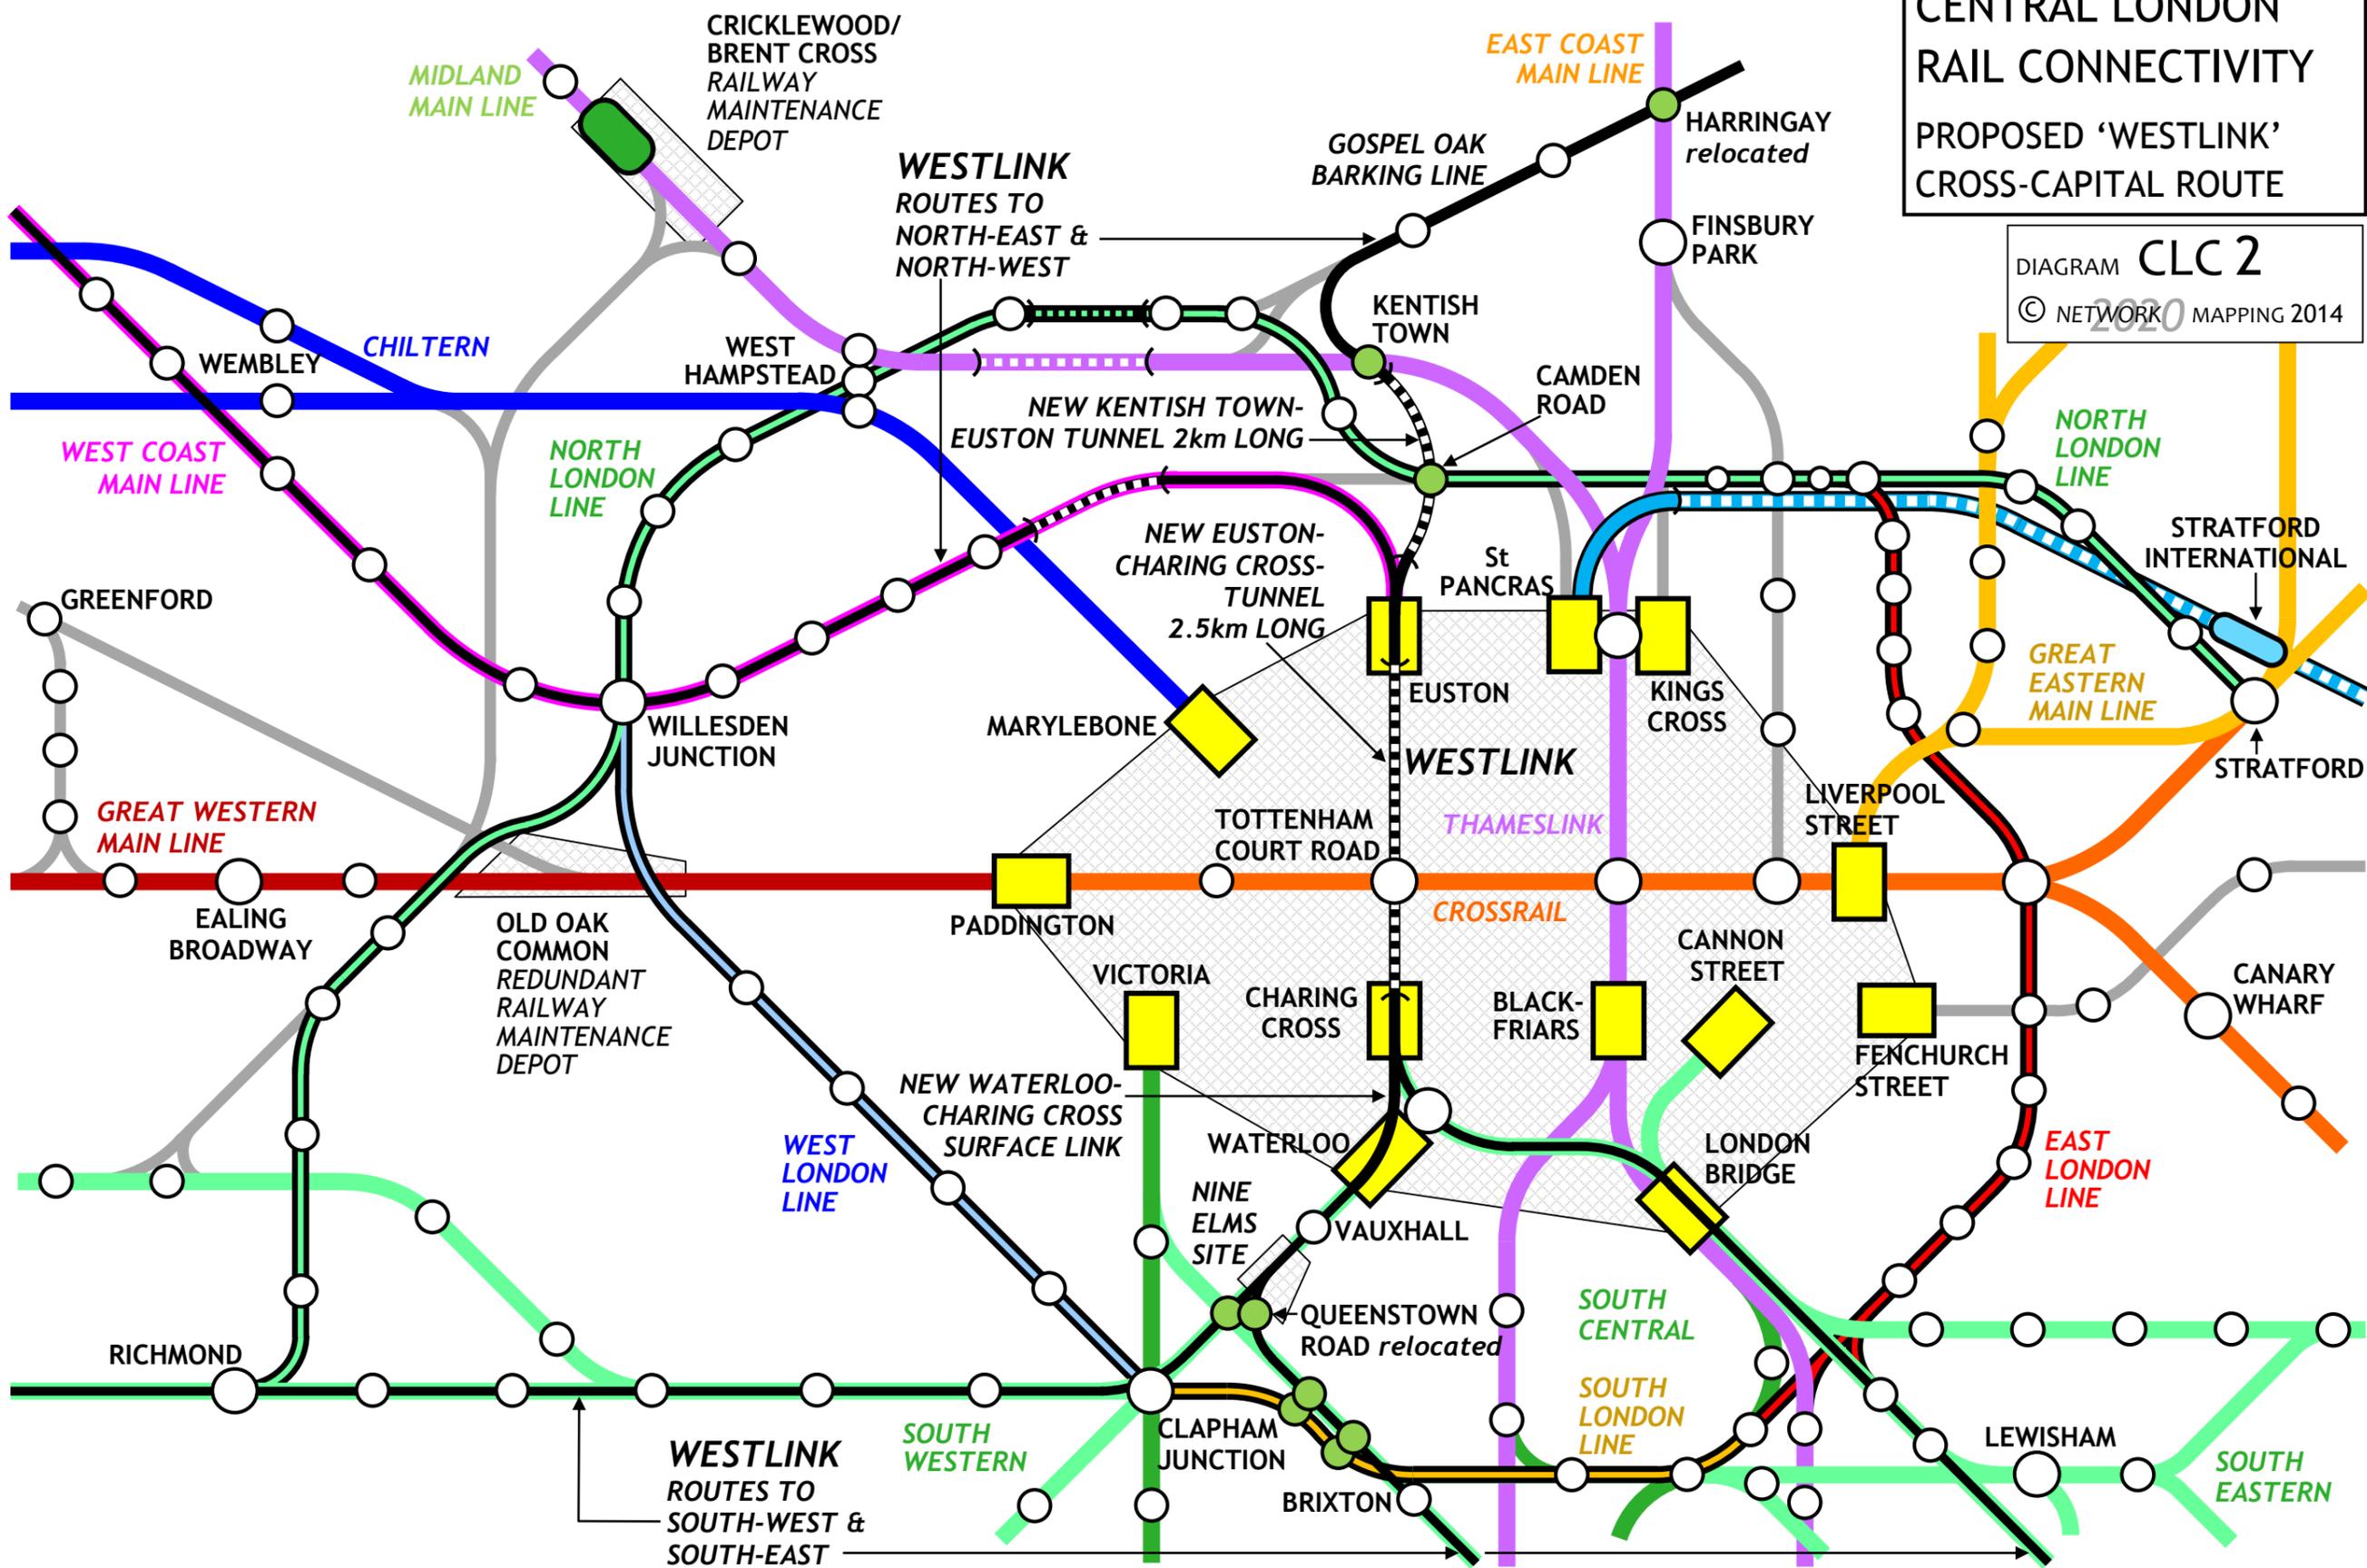

The potential networks facilitated by CrossRail 2 and Westlink are shown together, to allow direct comparison to be made. On the basis of the much reduced length of new tunnelled construction, a notional cost estimate of around £5 billion might be made for Westlink, perhaps £10 billion cheaper than CrossRail 2.

CLC5, CLC6, CLC7 : DETAILED PLANS SHOWING WATERLOO-CHARING CROSS ELEVATED ALIGNMENT

The elevated route between Waterloo and Charing Cross is crucial to the Westlink scheme. The route will enter Waterloo Station via the currently redundant Eurostar terminal, with tracks and structure realigned to continue north on viaduct to connect to the existing line into Charing Cross. The proposed alignment trims the Shell Centre, and this will require major modifications to curve the frontage to align with the new railway. Most of the length of Charing Cross station trainshed must be devoted to the ramp necessary for the new northward tunnelled route to dive below ground level; instead, the Westlink platforms at Charing Cross will be established largely on the river bridge, with major structural modifications required. This presents an opportunity for a direct stair/escalator link to the better-connected Embankment Tube station.

The case for investment in Light Rail in London

[contact redacted]

About the author: [redacted] is a transport analyst. He worked at the Confederation of Passenger Transport (CPT), representing light rail and tramway operators. Before that, he worked on public transport at the Transport Research Laboratory, including a study of the light rapid transit and urban development and on the effects of rail investment in Tyne and Wear and Glasgow. Since retiring from CPT in 2012 he has continued to work with UKTram, and represents the UK on a EU-funded study of urban tram safety in Europe.

The National Infrastructure Commission has called for evidence on three major national challenges:

- Improving connectivity between cities in the north of England,
- Large scale transport infrastructure improvements in London,
- Improving how electricity demand and supply are balanced.

This paper addresses the second of these challenges and examines the case for investment in light rail and modern tramway systems in London.

What light rail can do

Light rail, and in particular a street-running modern tramway, is a modern transport mode which uses vehicles which run on rails but which are lighter than traditional rail vehicles. This enables higher acceleration and deceleration, steeper gradients and sharper curves than on a railway. Hence stops and stations can be closer together, providing a better urban public transport service. The capability of running in the street, either on its own right of way or mixed with road traffic, means the infrastructure can be lighter and less intrusive, requiring less in the way of bridges and tunnels which, of course, makes it less expensive. Light rail is normally driven by electricity, making it non-polluting at the point of use and able to use power generated from sustainable sources. Also, modern trams generally allow level boarding, which makes boarding easier for people with disabilities.

A modern tramway can carry between 4000 and 10,000 passengers per hour in each direction (pphd). This means it has a much greater capacity than a bus service, which is limited to about 3000 pphd by the need to stop, start, load, unload, accelerate and decelerate. In a large city, buses do not provide adequate capacity.

Several cities in the British Isles, including Manchester, Sheffield, Dublin and Edinburgh, have installed modern tramways. They are successful at carrying large numbers of passengers, attracting car drivers, and promoting urban regeneration. In London, the tramway in Croydon and the Docklands Light Railway (which does not run on-street but is classed as light rail) have both produced similar benefits.

The case for light rail in London

In this paper we look at the scope for light rail investment in London.

Currently, London is experiencing a great deal of investment in its rail services. Crossrail is being built and will carry passengers between Paddington in the west and Liverpool Street in the east from 2019. Crossrail 2, linking the north-east and south-west, is under development. Extensions are planned to the Bakerloo and Northern lines, and the Docklands Light Railway undergoes continuous development. In recent years, sections of underused rail lines have been linked together to form the Overground network, serving mostly circumferential routes. These improvements have been, or have the potential to be, very successful.

Of course, rail improvements are enormously expensive, and, as this paper shows, do not serve all needs. We believe that public transport investment can also be effective at a more local level, providing short-distance, readily accessible, public transport both in central London and in district centres in the London area.

Why London needs efficient rail transport

We start with the observation that London is a large city. This is obvious, but London is by far the largest city in the United Kingdom, and can be classed as a world-class mega-city, one of only two in Europe (Paris being the other).

Large cities depend on rail transport to bring people and goods into their city centres. One has only to see what happens when rail services in London are disrupted by strikes or weather: people cannot get to work and the city could not operate for long. Of course, London already has a good many rail lines. The Underground brings 3 million people into the capital every day, and the suburban railway brings another 1 million. In the course of a year, the Underground carries more than 1 billion passengers, as many as the whole of the national rail network.

Large cities also depend on rail to carry passengers within their city centres. The city centre of London – defined broadly as Zone 1 or the area within the Circle Line – is too large for walking. This makes London different to other large cities such as Birmingham or Manchester, where it is possible to walk across the centre in 15 minutes or so. London needs an efficient public transport network within the city centre.

Central London is of course served by the Underground, but even with the fairly dense network of lines in the centre, it does not serve all the major corridors. Furthermore, the time taken for a passenger to descend to the platforms and back to the surface makes the Underground inefficient for short journeys. Hence, many central area journeys are made by bus, and there are many intensively-used bus routes. But buses get delayed in traffic, and on some busy corridors they struggle to cope with the demand, as a bus corridor cannot operate at more than about 30-40 buses per hour.

Another feature of the size of London is that it encompasses a number of district centres which are sizeable centres in themselves. The London Borough of Croydon claims that if Croydon were not “embedded” in London, it would be Britain’s 8th largest city, surpassing Coventry and Wakefield. It is not alone; there are other

district centres such as Stratford or the Richmond-Kingston area which could make a similar claim. Such centres need their own public transport networks, and the density of their transport corridors means that buses alone will not suffice.

We would argue that there are busy corridors, both in central London and in district centres, which would be better served by a modern tram service, with vehicles that can carry up to 200 passengers and, given the right priorities, can provide a shorter end-to-end journey time. A modern light rail or tramway system would provide a more efficient transport system, less costly than Underground or suburban rail improvements, but able to cater for busier corridors than buses can.

Suggestions for where light rail should be considered

Where would such corridors be located? It would of course be for Transport for London to look at current flows, do the modelling and identify corridors for improvement, but we make some suggestions here.

Light rail in Central London

Firstly, in central London, the corridor from the **Euston-Kings Cross area to Waterloo** station is one of the busiest, but it is not well served by the Underground. A few years ago there were well-developed plans for a tramway called the Cross-River Line to serve this corridor. It would run from Waterloo, across Waterloo Bridge, and then follow Kingsway and Southampton Row to Euston before turning right along Euston Road to St Pancras and Kings Cross. North of Kings Cross, the line would serve Camden Town, and south of Waterloo it could be extended to Peckham or to Clapham Junction, relieving the overcrowded rail lines into Waterloo. The line was forecast to carry about 70 million passengers per year, more than any other tramway in Britain. **We recommend that the plans for the Cross-River Line should be re-instated.**

Secondly, **Oxford Street** has been identified as one of the busiest corridors in London. It is served by many bus routes, but there are so many buses that progress is slow – very often, it is quicker to get off the bus and walk. It is also served by the Central Line and will be served by Crossrail, but with only 4 Underground stations and 2 for Crossrail this hardly constitutes an efficient local service. A tram service between, say, Holborn and Marble Arch would provide better connectivity for Oxford Street shoppers, and it could be extended to Paddington to serve the mainline terminal. One drawback to the earlier Oxford Street tram plans was where to locate a depot, but that could be accommodated by integrating the Oxford Street tram line with the Cross-River Line and using a joint depot south of the river or in the Kings Cross area. **We recommend that the plans for an Oxford Street line should be re-examined.**

Thirdly, there are no Underground lines serving travellers between **Victoria and Paddington**, via Hyde Park and Marble Arch. Another heavily used bus corridor is that between **Victoria and the City**, via Parliament Square, Trafalgar Square and

the Strand. These corridors could benefit from light rail investment. **We recommend that TfL should examine the case for light rail investment on these and other densely-trafficked routes in central London.**

District centres in London

Among district centres outside central London, Croydon and Stratford are just two examples where investment in light rail could improve local transport. Neither is a rich area, and there are many people in these areas who are not well-off, or are even deprived. Their lives are far removed from those of the well-paid people who work in the City or shop in the West End, areas which they seldom visit. People in east and south London depend on public transport for access to employment, shops, schools and leisure facilities, and businesses depend on it for their employees and customers. Investment in public transport would be beneficial on many levels.

We have already identified **Croydon** as a centre which requires good public transport. There is an existing tramway in Croydon which links Addiscombe and Beckenham Junctions to Central Croydon and on to Wimbledon, carrying large numbers of passengers. **We recommend that the various plans for extensions to this system, including one to Crystal Palace, should be pursued vigorously.**

In east London, **Stratford** is a rapidly developing area with a large shopping centre. It is already well-linked to central London and other centres by public transport, with suburban rail, two Underground lines and two Docklands Light Railway lines. But Stratford depends heavily on buses in several corridors, notably eastwards along Romford Road and to the north-east towards Leytonstone. **We recommend that these corridors serving Stratford be examined with a view to installing light rail lines.**

In addition, there are other district centres within the London conurbation which have similar needs. Examples could include the Tottenham-Wood Green area, the Wembley area, and Kingston-upon-Thames and Richmond where a tramway could be developed to link with Croydon. **We recommend that all such areas which are currently served by heavily-used bus routes should be examined for possible light rail investment.**

Conclusion

In this paper we have suggested some areas, both in central London and in other centres within London, which should be considered for transport investment. Grand projects such as Crossrail and Underground extensions are fine, but they are expensive and take many years to develop; also, they do not necessarily provide the local accessibility that public transport needs. A modern tramway can provide high capacity transport which is safe, reliable and readily accessible to passengers, at a much lower cost than heavy rail or Underground investment. **We recommend that TfL examine the options described in this paper and others where light rail would be beneficial.**

Future investment in the London's transport infrastructure

Submission from: [contact redacted]

I do not wish to comment directly on future investment in the London's transport infrastructure.

That said, I do wish to **highlight the long term neglect of land drainage maintenance that leaves transport (and other) infrastructure liable to and at a steadily increasing risk of flooding.**

Very briefly.....

When the Environment Agency took over from the National Rivers Authority in the mid 1990's they disposed of the River Thames dredgers upstream of Teddington. Disposal facilities were closed and dredger operators dispensed with.

The £110m MWEFAS flood alleviation scheme was then constructed. On first use in 2003 the Jubilee River suffered severe structural damage. In spite of £5m in repair costs it is unable to convey its design capacity and is still falling apart today. The Thames downstream of Windsor flooded badlyin 2003 and twice in 2014.

The Environment Agency's current River Thames Scheme flood alleviation project is costed at £302m at 2009 prices. I have no doubt that this will be a £1bn if the project gets completed in 2025.

In my opinion this project is flawed in the same way that the Jubilee River was. The Environment Agency is unable to learn!

The really big issues are.....

- 1) The EA has no legal duty to maintain or improve the conveyance capacity of designated main rivers – so it doesn't.....
- 2) There are approximately 100 blocked flood arches upstream of Teddington – used as offices, workshops, warehouses etc. These reduce the discharge capacity of the system.
- 3) I have explained the problems to the EA and stated that..... if they implement the River Thames Scheme..... if they are lucky they will only flood Staines. If they are unlucky they will flood London.

Please feel free to contact me for further details

[redacted]26/11/2015

LONDON'S TRANSPORT INFRASTRUCTURE

Contribution to

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to, Crossrail 2.

Introduction

In 2018 there will be two major infrastructure events, the opening of Crossrail and Thameslink, the biggest such schemes since the Channel Tunnel and Rail Link, and the upgrading of the West Coast Main Line.

The next major project to follow these is HS2. Due to open between 2026 and 2033, this dwarfs the other schemes. It will provide fast interconnection between many of the major cities of the Midlands and northern England. It will also free up urgently needed capacity on the existing main rail lines, rapidly increasing passenger numbers and freight.

The objective now must be to fully utilise the potential these projects have created. There are many transportation needs to be met, constrictions to be alleviated and pollution to be reduced. With tight budgets, integrated forward looking infrastructure planning is the only way to proceed.

The Elephant in the Room

Looming over much of Greater London's infrastructure forward planning is the lack of a decision on an upgraded or new hub airport capable of meeting the long-term needs of long distance travel; the elephant in the room.

The Airports Commission have recommended adding a new north west runway at Heathrow adequate to meet demand up to 2050. The Government have deferred a decision accepting these recommendations until a proper study of the impact of expansion on air quality and noise levels. Aircraft noise pollution already inflicts unacceptable misery on hundreds of thousands people in London who have repeatedly been told that new quieter aircraft will bring relief; the Airports Commission report shows otherwise. Even more serious for Heathrow's expansion is air quality. If studies show it is likely to exceed legal limits, then expansion cannot go ahead.

The Airports Commission admit their alternative solution, expansion at Gatwick, will not result in an adequate international hub for UK's economic future. The only real alternative to an expanded Heathrow, the one the Commission rejected, is the Thames Estuary site on the Isle of Grain. This was presented as having an unmanageable capital cost, partly due to the need for extensive new transportation infrastructure. This needs to be examined objectively in relation to the needs of other proposed developments in the same area.

Thames Gateway Regeneration Zone

The Regeneration Zone stretches forty miles along the estuary from Canary Warf in London to Southend in Essex and Sittingbourne in Kent. This concept is aimed at expanding London's economic activity along the Thames Estuary encouraging business enterprise, employment and new housing by providing improved infrastructure. It has succeeded beyond anyone's expectation in the Docklands at the western end of the Zone. It is undoubtedly in need of an employment catalyst to spread it eastward, together with improved rail and road links such as the extension of Crossrail eastward from Abbeywood and the construction of a Lower Thames crossing proposed to alleviate the lack of capacity at the Dartford Crossing on the M25. This will also overcome the barrier to economic activity between Kent and Essex.

London is desperately in need of additional affordable housing, either within the Greater London Area or outside with adequate commuter links. Thames Gateway Regeneration Zone can offer this once Crossrail is completed and the south spur extended.

The Employment Catalyst

It is hard to imagine a more effective catalyst to set in motion the regeneration of the Thames Estuary than the construction of a new hub airport on the Isle of Grains. There is only need for one hub to serve the UK and for a new one to succeed economically, the closure of Heathrow is a prerequisite. Employment priority would be given to Heathrow staff who are prepared to move near to or travel to the new airport. It can be anticipated that well in excess of 50,000 new jobs will be available for people living in the regeneration zone. A lower Thames crossing would spread the benefits to Essex.

Lower Thames Crossing

The Dartford Crossing on the M25 is already operating close to capacity. Studies have been carried out to compare providing extra capacity at Dartford with two alternatives further down the Thames. The appraisal report "Review of Lower Thames Crossing Options, April 2013" discarded the middle route. The lower route leaves the A2/M2 junction east of Gravesend and crosses the Thames east of Tilbury joining the M25 between junctions 29 and 30. Improvements to the A229 linking the M20 and M2 were also considered but were found to be very expensive for such a short road. The crossing and M20-M2 link are presently being studied on its own merits. In the event that the hub is to be constructed on the Isle of Grain, consideration should be given to building the link further west where it could also act as the main access route to the airport for airport traffic originating west of junction 5 on the M25.

Consideration should also be given to a combined road and rail crossing structure, although a separate rail tunnel will probably prove more economical.

Airport, Rail and Road Access

Heathrow has grown over the years with poor rail access, encouraging unacceptable levels of road usage, contributing to air pollution and congestion on roads leading to the airport. Closure of Heathrow would help solve both problems.

Infrastructure already in place would mean that rail links to a new estuary airport can be world class with little extra investment cost to be set against the airport alone.

- The extensions of Crossrail beyond Gravesend would provide a high capacity frequent service. Travel times of under one hour from Old Oak Common and ten minutes less from Tottenham Court Road would be expected.
- An airport link to HS1 would allow provision of express services in under half an hour on the “javelin” trains to Kent from St Pancras and Stratford. These trains are presently running 6 carriages whilst 12 are allowed for in the train design and platform length. The track has been built to UIC GC loading gauge which allows for double-decker trains which are being increasingly used on the Continent. There is definitely adequate latent capacity to meet the need for express travel to the airport. The two halves of the “javelin” trains can be separated automatically allowing even more flexibility.
- Of equal importance to the London links is the possibility to establish fast rail travel to other parts of the UK. With HS2 in place, many of the major cities of the north, Midlands and the west can be provided with a through service to the airport in under two hours. The main capital expenditure will be a direct link between HS2 and HS1. With this in place, up to four HS2 trains per hour could bypass Euston and stop at Stratford for Docklands, at Ebbsfleet to connect with Eurostar services, and terminate at the hub airport. There would be no loss of capacity to serve London, as passengers for other destinations could change at Old Oak Common onto Crossrail, avoiding poorly connected Euston. Passengers from the west would join at Old Oak Common.
- It has been assumed that HS1 has a maximum capacity of 16 paths per hour in both directions between St Pancras and Cobham before the Medway crossing. Of these, six could be allocated to Eurostar, six to “javelin” services and the remaining four to HS2. Beyond Cobham, there would be a lot of extra capacity allowing for freight services which would have to join the Kent lines into London, or use a new rail link to Essex if one is built. This would tie in well with the new London Gateway Port and Logistics Park already in use downstream of Tilbury. There would also be capacity for trains from the Continent to what could become one of the world’s best airports for range of international connections.
- The rail route to Waterloo, in use for Eurostar services before Phase 2 of HS1 was built, could be reinstated to provide an adequate semi-fast service to Waterloo. There is an extra-ordinary provision in the costs presented in the “Airport Commission’s Inner Thames Estuary Airport Summary and Decision Paper, September 2014” for a new express rail service from Waterloo via Barking Riverside bringing their enhanced rail package provisions to £26.9 billion! This, together with estimated road improvements of up to £17.2 billion, adds a £44.1 billion infrastructure bill to the airport development without any attempt to discuss what would be built in the without airport scenario. This approach to dismissing an apparently unwanted project would surely be more in place in a script for Yes Minister than a document intended to decide the long-term provision of hub airport capacity in the UK.

- The above rail access would be more than adequate to support a hub airport with capacity to meet demand beyond 2050. The demand on road access would be reduced to a much more manageable level than at Heathrow. A further route could be added if a rail tunnel is built at the Lower Thames Crossing. The north-eastern Crossrail line could be connected to the airport by a line from Romford or Brentwood. This would provide additional capacity but, even more important, would add resilience to rail access when maintenance is carried out on other lines.
- Thameslink, the proposed Crossrail 2 and the existing rail network could play an important part in providing acceptable linkage to the airport from the zone outside Greater London.

HS1 – HS2 Link

An HS2 Phase 1 report, Review of HS2 – HS1 connectivity and Rail Links to the Continent – November 2015, is now available. It suggests numerous tunnel alternatives that could connect the two lines, plus several involving passengers leaving HS2 trains at Euston and walking or being carried on travellers to St Pancras.

The only realistic solution which meets the simple requirement for HS2 trains to join HS1 and terminate at the airport is a variation of option R6. The pair of rail tunnels from Old Oak Common would bifurcate near Chalk Farm, with one pair to Euston and the other pair joining the HS1 line north of St Pancras before it enters the tunnel to Stratford. The bifurcation would be of a similar design to that already built on Crossrail near Stepney Green. The report rightly points out the difficulties this solution would meet at the St Pancras end, but probably no more difficult than those recently solved by Crossrail. The Thameslink canal tunnels completed recently under St Pancras should provide useful information on shallow tunnelling in the area.

Closure of Heathrow

The closure of Heathrow is inevitable if a new hub airport is built. Airport staff will be seriously affected if they are not able to move to the new airport unless good transport links are available. A grade separated interchange between the Great Western lines/Crossrail and HS2 at Old Oak Common would serve this purpose for a few years until HS2 and HS1 lines are fully utilised.

Many businesses have located near Heathrow to take advantage of the freight services it can provide. A freight consolidation and distribution centre should be retained there with a fast and frequent rail freight service established, if possible, to reduce road haulage between the two sites. Heathrow airport site, with its forthcoming Crossrail services, will be a prime site for commercial and residential development.

Overview

The delay in deciding whether to proceed with a third runway at Heathrow is a major impediment to preparing a long-term plan for London's transport infrastructure. However, this review suggests that most of the components needed to support a change in location of UK's hub airport, if it occurred, are already being actively progressed to meet other identified needs.

The only scheme warranting immediate action is the HS2-HS1 link tunnel. This should be studied in detail so that it could be built with HS2 Phase 1. Any other approach would be very short-sighted and hugely disruptive for adjacent rail services.

There is real need to reduce the strain on commuter trains into London and improve access to areas of more affordable housing which is rapidly disappearing from Inner London. Crossrail 2 can play a major part in this at a high price. This is inevitable for any scheme requiring long tunnels under London. A useful intervention would be a study covering the Greater London area and commuter links to identify which routes could carry double-decker trains without excessive infrastructure rebuilding.

The author regrets only noticing the call for submissions shortly before the closing date, otherwise a more polished presentation could have been made.

[name redacted]

Dear Sirs,

I consider that one of the aims of the NIC should be to link projects that can support each other or generate synergies, create economies of scale, or pursue other national or regional priorities as a byproduct, thus "killing two birds with one stone" and leveraging funding in the best possible way towards desired outcomes.

In particular, I am anxious that all future tunnelling projects should be linked with land reclamation schemes, so as to maximise the land available for other uses that are needed, including housing development or other infrastructure.

I would draw to your attention that spoil from the British sector of the Channel Tunnel was used to create an extension to the cliffs of Kent known as Samphire Hoe, which is now a unique habitat, nature reserve, public open space and tourist attraction.

Given the pressure on land for housing, green infrastructure, food production, energy infrastructure etc., I consider it vital that spoil from Crossrail 2, a Trans-Pennine Tunnel, and other similar schemes be used for seabed land reclamation in or near to existing cities or towns so as to create new footprints for high-value coastal housing schemes with sea views. The proceeds of sale of such housing would subsidise the original project, and it would help to meet the housing imperative without taking any greenfield land.

Yours faithfully,
[redacted]

Response to Infrastructure Commission Call for Evidence: Questions relating to Greater London:

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Lack of housing, especially affordable housing within reasonable travel distance of employment and services.

Dependence on the private car, especially away from Inner London and, resulting from this:

The concomitant wasteful use of land (for roads and parking) that should otherwise be used for housing, other beneficial uses, biodiversity and flood mitigation;

Lack of opportunity (and safety) for walking, cycling and public transport, all of which would contribute to public health through less obesity, better air quality and less premature morbidity and mortality with significant effects on the costs of health care.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

There have been far too many reports that have been shelved (e.g. the two immediate Post-War railway reports following the Abercrombie Plans, of which only a few fragments have been built, the proposals half a century ago for what is now Crossrail 1, the Bakerloo Line Extension, expected in the 1950s, and the inordinate delays on Thameslink "2000"). IMMEDIATE starts should be made on

- The elimination of bottlenecks on the radial rail network (e.g. E Croydon, Welwyn Viaduct, Clapham Junction and Woking [please see below])
- The provision of orbital or tangential routes serving outer London suburbs, town centres and locations beyond, on the model of Croydon Tramlink, and the provision of railway lines to improve connectivity (e.g. the Croydon link)
- The transfer of funding from increases in road capacity to public transport and traffic management, including the improvement of environmental conditions in neighbourhoods through the rigorous enforcement of (low) speed limits and restrictions on obstructive pavement parking etc.
- Crossrail 2 regional scheme and bringing forward radial line improvements such as reinstating four tracks in the Lea Valley and additional tracks on the SW Main Line.
- The safeguarding of land in rail corridors for improvement (e.g. if true, the reduction of the rail formation under Earl's Court on redevelopment to two tracks is incredibly short-sighted, given the likely capacity pressures on the West London route).
- Cross River provision downstream of Docklands to link **rail** services for passengers and freight north and south of the Thames (rather than the current preoccupation with road traffic crossings).
- Planning for a direct through link from HS1 to HS2, so that Old Oak and Stratford can play a fuller part in distributing national London-bound traffic, and direct Continental services can be provided from Birmingham and Manchester without stopping in London – both relieving Euston and bringing the "Northern powerhouse" to reality, rather than just adding to Central London congestion.

I also advocate in particular an orbital link for West / South West London which I have put forward in the SW Route Utilisation Strategy consultation – please see the **Appendix** to this note, which considers some of the wider issues related to the M25 corridor in this sector.

What might their potential impact be on employment, productivity and housing supply in London and the southeast?

Although the Commission is not including Airports in the request for comments, it has to be faced that a wrong decision here would make infrastructure provision well-nigh impossible. In particular, the huge housing demands from increased economic activity that a third runway at Heathrow would require would be unsolvable. The public's resistance to the development that would be needed on the green belt and beyond (including AONBs) and the near-certainty that air quality considerations would mean lengthy legal challenges would result in a collapse of planning in west London and beyond and affect London's performance as a whole. (It must be recognised that the Heathrow T5 Inquiry was unequivocal that T5 should be the last major airport development there).

Conversely, the early use of land currently blighted by proposals for the third runway for housing and integrated transport (building on present routes like Crossrail 1) could go a long way to make an impression on the SE's current long-term housing supply deficit, and safeguard areas beyond Greater London from over-development likely to be unsupported by infrastructure which is currently fairly poor.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Better integration with regional rail routes, e.g. Lea Valley / Stansted and SW Main and Suburban routes, to reduce congestion at London termini and provide more journey possibilities, plus widening as suggested above.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?
- What innovative funding mechanisms could be considered to support delivery of key schemes?
-

From the land development of the first Metropolitan Railway, through the development of the New Towns, to the proposals for infrastructure financing worked out for example in the Cambridge Growth Corridor in the late 1990s, many proposals have been made for how development might be financed, mostly involving the capture of future land value benefits to assist current development. Proposals along these lines have been made by many of the professional Land and Planning bodies, who can be expected to be presenting them to you. The obstacles seem to be more "political" philosophy than practicality!

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

I do not have direct information on these issues.

londonevidence@Infrastructure-Commission.gsi.gov.uk

Appendix:

The following response to the Wessex Route Study Consultation, made in February 2014, considers the application of some of the issues raised in the Commission's questions, and makes a specific proposal for an orbital rail route to improve infrastructure in the SW and W London and the M25 Corridor.

1. This is an individual response by a resident of Woking. I have a particular interest in the consultation as I am a retired town planner who has had direct responsibility over the years for, *inter alia*:

- Strategic planning, environmental and planning appraisal techniques for large infrastructure projects and sub-regional plans
- The interrelationship between transport and land use, including the geographic and time – accessibility of different modes of transport
- Specific policy issues relating to the needs of industry, the roads programme and rail freight (including at one time re-writing the Freight Facilities Scheme Manual)
- Working (successfully) to bring forward the proposals for South Hampshire electrification by identifying socio-economic benefits, so that the scheme was implemented earlier than originally proposed by the then railway authorities
- Regional planning – including RPG3 (London) and RPG9 (for the wider South East). This included ensuring that strategic reference was made in RPG3 to Crossrail and Chelsea-Hackney (when transport colleagues in government were advocating dropping both!)
- Housing demand and supply in these regions and subsequently the national growth area proposals
- The 700 conditions attached to the Heathrow Terminal 5 decision (as part of the T5 decision team).

2. I am not a railway industry expert, so please forgive any misuse of railway terminology in this response (I have however been a close follower of modern railway matters for over 50 years, and a regular rail and rapid transit user). However, I would like to record at the outset that the consultation document is admirably clear and readable.

3. This response concentrates on the SW Main Line and the potential for an outer orbital London rail service, for this is where I believe the greatest challenge and opportunities lie. Following general observations on the Study as a whole, I advocate the early implementation of:

- Grade separation and additional platforms at Woking and
- An orbital route from Guildford to west London via Heathrow, mainly on existing tracks or following the M25 – which I have termed “Airtrack plus”

General observations:

4. The Route Study appears to be concentrated on the current problems of congestion and ways to squeeze capacity out of a system running at a level which is less than wholly resilient (giving no room for even minor upsets in service). There is clearly an operational and “political” need to address this, but the danger is that opportunities for growth in rail usage and coverage are ignored. Major

timetable changes, new stock and train lengthening has ameliorated conditions more recently for the outer suburban services, (but often at the expense of frequencies of the inner suburban, as a comparison with published timetables from 50 years ago will show). Nevertheless, as is well recorded in the Study, overcrowding is rife and action is needed beyond mere tinkering even to maintain the status quo amongst a growing population.

5. What the Route Study underplays is the potential for further growth in rail traffic if current constraints on journeys (including journeys that cannot at present be made by efficient public transport) were eliminated. Transport demand modelling – and to some extent the current franchise system – tends to concentrate on existing flows and congestion, and underplays the potential for new journey opportunities. Derived demand approaches completely ignore the established contribution that, for example the “tubes” gave to the development of the London suburbs and the Metropolitan Railway did for “Metroland”. Planners have long known that improvements in accessibility can bring increases in usage. The growth of traffic on the SW main line has been well recorded. Past capacity increases have stimulated growth – the effect of electrification of the Southampton line and resultant reduced journey times was particularly marked in the Twentieth Century and stimulated commuting and development along the corridor.

6. Today there is a welcome recognition of the development opportunities of new transport links – redevelopment around Crossrail stations being an example – but transport planners still tend to belittle attempts to create new markets. An example is the history of the Overground, which, when first mooted (as RingRail) in the mid C20, was rubbished by transport planners as having no demand and by railway operators as completely infeasible. Indeed, transport planners at the time were seriously contemplating using the trackbeds of the supposedly redundant lines for urban motorways [I was involved in assessing the quite devastating impact of these routes]. The work of the new Deputy Mayor and others in the more recent GLA facilitated the development of the Overground, and its attractive services have led to the original concept being overwhelmed by passengers, so that trains and platforms have needed to be lengthened and frequencies improved.

7. A simple example of suppressed demand today is Clapham Junction, where the non-stopping of Main Line trains throughout the peak means (from timetabling and platform constraints) that otherwise entirely feasible journeys to such major traffic attractors as Croydon or Inner West London just cannot be made from main line stations as the interchange is not possible. Here, the issue of current capacity and future opportunities overlap – as dealing with one could unlock the potential and generate increased traffic (and revenue) to a wider range of destinations.

8. I would like to see an immediate Improvement of Clapham Junction. Pending a major rebuild, urgent consideration should be given to the conversion of the current Up Fast line to Fast Reversible, with platform extensions and the relief of severely restricted turnouts to platforms 7 and 9 to enable a reasonable number of peak hour direction main line services to call there (and be overtaken by non-stopping services if necessary). This should take place irrespective of the decision on Crossrail 2 (I support the earliest implementation of the regional scheme and additional tracks west of Wimbledon.)

9. A more difficult, but pressing, issue is the traffic opportunity of outer orbital services, represented (by road) by the M25 corridor, which in my view is an opportunity for rail waiting to be grasped, preferably immediately (please see below).

10. Capacity restrictions also inhibit the construction of new stations, on which the Study is silent. I assume that they have been ignored, from the statement given in section 3.6 *other conditional outputs*. However, there are significant opportunities for enhancement of the connectivity benefits

of rail and of attracting traffic at such locations as Burpham and Park Barn (both in Guildford) and these should be included as an early planning aim. These two, from the point of view of the local areas served, are well overdue. Others should be investigated, for example, Stoughton (Guildford) and Sheerwater (Woking – in tandem with current regeneration proposals).

11. It is understandable that, given the physical restrictions on train movements, train lengthening is the first resort of operators (or more fanciful ideas such as double decker carriages as expressed in section 6.3). However, lengthening is probably reaching its practical limits for suburban services, whilst it should also be remembered that the attractiveness of public transport in suburban areas increases as frequencies increase. (Waiting and Interchange times are “valued” more than in-transit time). A Turn Up and Go service is necessary to be attractive to users, as seen most dramatically on the growth in traffic on the London Overground and some “Metro” services. It is therefore encouraging to see the Study examining the potential for enhancing the services over the day. Southern Electric managers considered 20 minutes to be the maximum waiting time without journey planning using timetables. In today’s faster, more instant, world, a frequency of 15 minutes or less would seem essential for non-rural services.

12. Most of the significant proposals of the Study are over the longer term, yet, as we have seen in the past, rail planning has been bedevilled by delays, prevarication and abandonment. The post war plans for cross-London RER main line tubes following Abercrombie (the Greater London Plan) were never implemented (e.g. main line tube F became a watered down Jubilee Line, the Northern Line New Works including taking over some SW suburban branches were abandoned). Major proposals for two E-W lines in the London Traffic Study were forgotten, and – as I mention above – Crossrail was very nearly abandoned too. It is clear from the Study that the current – welcome – proposals for capacity are quite insufficient to provide a resilient service for just the current passenger forecasts – let alone suppressed demand – and that major capacity increases are required immediately. Comparisons with the provision of infrastructure in other World Cities show London and the SE to be incredibly slow, notwithstanding the fact that where there is a will, infrastructure can be implemented relatively quickly (the DLR and Overground extensions being examples).

Relief of congestion at Woking

13. I believe that the flat junction at Woking largely determines the pattern of rail services on the entire SW Main Line, and it seems highly unlikely that the service through this junction could be improved without major work. As the Study points out, existing services through Woking are already seriously overcrowded. Without commitment to improvement at Woking, the only possibility for the SW Main Line (long distance services) seems to be the diversion of a few of these at Basingstoke to Paddington, building on the freeing of capacity on the GW Main Line by the rebuilding of Reading and the platform space at Paddington freed by Crossrail. Whether this could provide an adequate level of capacity without further major expenditure seems doubtful, and would do nothing for the growth in traffic over the Portsmouth, Alton and Basingstoke Line corridors. The construction of Platform 3 at Woking has been a palliative for terminating services, but entails conflicts with the fast lines and additional congestion on the approach to Woking, as many travellers already experience.

14. Woking is therefore the key to both improved rail services throughout the SW Main Line and the additional services needed to support Surrey and Hampshire. There is an additional opportunity to use this capacity to facilitate an orbital service meeting the unmet demand for access to Heathrow and the West of London (see below). In addition, planned proposals for development in Guildford,

Woking and the Blackwater Valley will add to travel demands. Significant commercial and residential developments are already proposed in the sub-regions, recognised in the Local Plans (emerging or adopted) for the area. It is very doubtful whether this level of growth can be sustained on the basis of road traffic alone without severe environmental and congestion implications, themselves fuelling strong opposition to any proposal for growth.

15. The draft Surrey Rail Strategy set out various proposals for additional rail services using the SW Main Line, but none would appear feasible without increased capacity at Woking (with the exception of a proposed terminating service into Platform 6 from Gatwick).

16. I therefore strongly support the Study's proposals for capacity enhancement at Woking by a flyover and extension of Platform 6 to be a through platform (section 6.1), but would advocate consideration of further enhancements, specifically the provision of, or passive provision for, a second additional through platform. Work on this should start as soon as possible.

17. Although development has encroached on some land that might be used for major improvement – which can be seen as incredibly short-sighted by both the past rail authorities and the planning authority – the potential still exists, helped by the fact that the Victoria Way bridge is multi-tracked, and there are abundant railway lands around the station area. It seems perfectly feasible for two new platforms to be located on the southern side of the station on the the up side, continuing the existing Platform 6 track and adjoining siding. In order to reduce impact on the Centrium residential complex, the platforms would begin at about the site of the present booking hall, but would extend over railway lands in the London Direction. (If necessary, appropriate screening of these approach tracks could take the form of a “green roof”.) There may be issues on the historic façade of the booking hall, but this could probably be rebuilt and incorporated in any new development. There is considerable potential for development over the station.

18. Proposals already exist in principle for a new development at the station to provide a bus interchange. Woking Borough Council has an entrepreneurial approach to development, as seen in the extensive proposals for further development of the town centre, and development of the airspace above the station could contribute significantly to its enhancement. A local advantage of any development could be the replacement of the totally inadequate public subway under the station by a convenient over-deck starting at grade from the existing station forecourt, leading to access to the town centre by escalator or lift and incorporating an over-track concourse (itself facilitating retail opportunities for the railway).

A proposal for an orbital railway for Outer West London –“Airtrack Plus”

19. The study refers in passing to the Southern Rail access to Heathrow (section 2.1.5), but in my view misses the much greater case for an orbital rail service, based mainly on existing tracks to link major traffic generators throughout the SW and W London sectors. At present, it is almost impossible to move around Outer SW and W London without going by private road vehicle. There is constant pressure to widen the M25, and the issue of air pollution (see below) is additional to the carbon contribution of road traffic, which is significant in contributing to climate change. The almost total dependency on roads also has considerable repercussions for the structure of the Western and South Western approaches to London, with spreading congestion adding to business costs and sprawl inhibiting efficient and sustainable land use patterns. This is not just a Heathrow issue, but one that affects all the major traffic generators and town centres in the sub-regions.

20. There may be a procedural difficulty, in that consideration of an orbital service is wider than the remit of the SW Trains Alliance, and falls into the category of cross boundary services (chapter 4), which clearly do not exist in this corridor at present. However, improved rail access to Heathrow and beyond is long overdue, and should be seen as a component of a transport strategy to facilitate orbital movements by integrated public transport - movements which can only at present be made by private road transport (with the exception of the rail air coaches which provide a minimal premium service to small numbers of passengers between the airport and selected stations). Moreover, the key to such a service is capacity at Woking and around Staines – both SW Trains’ territory.

21. In addition to the geographical attractions of giving access to major traffic generators – which is recognised in in the Study as “conditioned outputs” to existing stations but not potential new services – there is the issue of externalities and benefits, which do not seem to have been explicitly considered. There is a very strong case for including in any work on rail service assessment the many environmental benefits delivered by electric railway – from less polluting power supply to lower land take than other forms of transport. The main motorway corridors are significant contributors to poor air quality in outer SW London. There are dangers in underplaying the polluting effects of transport, and not just in respect of breaching European Directives designed to minimise the harm to the health of the population. The Environmental Audit report (HC212) in its recent overall conclusion, states:

Urgent change is needed in transport and planning policy to save lives and ensure that the UK meets European safety targets much sooner than the expected dates indicated by Defra. Air pollution is an invisible killer and a public health imperative. A fresh approach is needed for the health challenge we face, coordinating action by local authorities and communities as well as the Government.

An effective orbital rail service taking traffic from the M25 in particular would go a long way to mitigate the adverse effects of unrestrained road traffic in this sector of the South East.

22. Air quality is of particular concern in the area around Heathrow. It is not generally known that Heathrow T5 only just received planning permission. Senior officers of the government departments concerned considered that there was a very high risk of successful legal challenge from opponents, because of the effects of the environmental impacts of the terminal and its associated infrastructure. In particular, the combination of aircraft and road traffic had a wholly unacceptable result on air quality. This was resolved in the ministerial approval by the requirement in the planning conditions of an air quality management plan. It was also envisaged that some of the pollution from road vehicles would be mitigated by the transfer of trips to rail. In addition to the requirement to extend the Heathrow Express and Piccadilly Lines, specific provision was given in the conditions for a provision in the T5 station box for rail access to the west / south west, where the current modal split was particularly poor. In the event, the rail access was not constructed and air quality remains appalling in the M25 and M4 corridors. (The relevant files were declassified on the publication of the T5 decision and should have been kept as a historical record of the longest inquiry.)

23. Over the years, various proposals have been made and abandoned for rail access to Heathrow. SWELTRAC, Airtrack, the Western Connection and others have been made. These proposals have been seen as a means to serving the airport alone, not for more general travel, so they had limited objectives and potential. Airtrack in particular was conceived as a small addition to the existing infrastructure, with links to Guildford and Staines. It was not surprisingly abandoned in the light of the opposition of local interests in Egham and Staines objecting to more frequent closures of level

crossings, and the limited scope for services - curvature of the track at Staines and Virginia Water, the inherent limited track capacity of the Windsor lines through the junctions, and the almost complete lack of capacity at Woking meant that it would never have been a sufficiently attractive service, especially at commuter rush hours. However, the need has been recognised for years, and is there now, not in some far flung control period future.

24. A revived, but extended “Airtrack Plus” route as part of national railways (not an airport concession), serving destinations both south and north of the airport would have two benefits:

- It would mitigate the pollution caused by the road traffic emanating from Heathrow in the short term, as well as providing an alternative to road traffic over a much larger area (including the opportunities for easy interchange to the main rail radial lines)
- It would provide a resilient solution to movement around the West and South West of London in the medium to long term. Whether or not Heathrow was extended, it would provide rapid and frequent services across a wide catchment to HS2 at Old Oak Common (and then proposed development area around it), as well as facilitating future urban development over the Heathrow site (or land to the north of Heathrow) were Heathrow to be wound down.

In addition, if Crossrail 2 goes ahead, and / or Waterloo and its approaches are remodelled, relief will be needed during the period of construction to the South West Main Line, which could be provided by services via “Airtrack plus” to inner West London and, if necessary, Paddington.

25. Whether or not Heathrow expands, there will be significant demand in the M25 corridor for access from the west and south west for the foreseeable future. Even if the Airports Commission does not recommend an additional runway at Heathrow, the existing airport will continue to be busy for years, and modal split from the west and south west is already very poor – a high quality rail service would be attractive. On the chance that (as the London Mayor and some strategic planners such as the TCPA have suggested) Heathrow is wound down in the longer term and replaced by a new town, the significant housing and commercial development would provide many traffic opportunities for rail in all directions – not just to central London (as at present). The background “planning parameters” for an orbital railway are therefore very robust.

26. I therefore propose a semi-fast orbital rail service from Guildford via Woking to Watford Junction and Brent Cross (and other destinations) as suggested in the annex below. The proposal is compatible with possible through running of Crossrail to Staines or any SW Trains Southern Airport access arrangement, as well as any possible Crossrail branch to the London Midland lines through Watford Junction. It would replace the less reliable Rail Air connections by coach. Clearly, some of the existing rail infrastructure is inadequate, but with comparatively modest improvements as noted below (especially in comparison with other major rail and road schemes) many benefits would be unlocked. Capacity improvements are in any event either in train or necessary on existing radial lines that would mean that the incidence of costs would be shared and not wholly attributable to “Airtrack Plus”. The extensive opportunities for interchange with local and main line rail, Underground and Overground, coaches and local buses, would enable very many journeys to be made that are not feasible at the moment, as well as giving opportunities for rail access from other destinations to main centres and traffic generators, many of which are now only accessible by road in the orbital corridor.

Annex: A proposal for an orbital railway

The Core Service for planning purposes would be 4 semi-fast trains per hour over the central section (Woking to Acton Wells/Old Oak Common). Much of the route already exists, but construction is needed at the main junctions and a section by-passing Staines. Additional local services would be provided from the interchanges (many of these local services already exist as part of radial services).

The core route would involve a semi-fast service calling at the following stations:

Guildford: Interchange with Portsmouth, Redhill – Gatwick lines and Blackwater Valley local services. Major town centre, hospital and university town.

Woking: Interchange with SW main lines to Salisbury and Southampton and outer suburban services. Major town centre.

Chertsey: Interchange with Weybridge – Staines services. Major hospital nearby could be served by short bus shuttle.

Heathrow T5: Interchange with proposed Heathrow – Reading service and possible “AirtrackLite”/Crossrail extension to Staines. International Airport.

Heathrow Central: Interchange with Piccadilly Line.

Hayes and Harlington: Interchange with Crossrail and Thames Valley services. Crossrail regeneration potential.

Ealing Broadway: Interchange with Crossrail, Central and District Lines. Major town centre.

Old Oak Common (Acton Wells): Interchange with HS2, Crossrail, Thames Valley and Great Western Main Line, potentially also Overground. Significant future national transport interchange and redevelopment area.

The core service would then split into routes to:

Wembley Central: Interchange with London Overground, Bakerloo Line and potentially London Midland local services (again possibly Crossrail in future). Town centre and international sporting facilities nearby.

Harrow and Wealdstone: Interchange with London Overground, Bakerloo Line and London Midland local services / Crossrail

Watford Junction: Interchange with West Coast Main Line, Metropolitan Line (committed diversion), London Midland and London Overground. Major town centre.

And [via Dudding Hill line]:

Brent Cross (proposed station): Interchange with Thameslink and potentially East Midland services. Major retail centre and redevelopment area.

Potential extensions of services and options:

Basingstoke – Farnborough – Woking

Gatwick – Redhill – Dorking - Guildford

Brent Cross – Mill Hill Broadway – St Albans – Luton Airport – Luton (Major town and airport)

Watford Junction – Hemel Hempstead – Bletchley – Milton Keynes. (Major town and links with E-W rail corridor)

Main Infrastructure Requirements (apart from possible signalling and pointwork where needed to enhance track capacity and subject to detailed engineering studies):

Guildford – potential additional platform already under consideration

Woking – Flyover and additional through tracks and platforms (as discussed)

Chertsey – Heathrow: A new line following the M25 from the existing M25 rail overbridge to the Heathrow T5 station box. The most sustainable solution would be tracks built on the inside lane of the M25, as the capacity of a railway is far higher than a lane of road, although this might seem, under current policies, outlandish! Politically, construction alongside or under the alignment of the M25 is likely. As tunnelling expertise has advanced, this is probably the easiest solution, as we have seen on the Northolt section of the HS2 proposal, and would be plain tunnel, so would not involve any expensive station construction on route.

Acton Wells: New station with interchange to Old Oak Common, and either connection to Euston AC slow lines NW of Willesden or additional tracks to join DC lines at Wembley Central.

Brent Cross: provision for platforms on existing freight lines (which join slow lines at Silkstream Junction)

London's transport infrastructure: Big Picture Stuff

A personal view

By email only to londonevidence@Infrastructure-Commission.gsi.gov.uk

I am pleased to provide this brief submission to the Commission's call for evidence.

As a Director of Ove Arup and Partners I led the team responsible for persuading the Government to abandon British Rail's proposed alignment for the Channel Tunnel Rail Link, and which subsequently designed and constructed what is now HS1. This has in large part been responsible for the success of the Olympics, the regeneration of Stratford and King's Cross and the transformational effect of the Javelin high speed domestic services.

As a Director of Heathrow Hub Ltd and Runway Innovations Ltd, the companies responsible for promoting the extended runway at Heathrow, one of three viable options shortlisted by the Airports Commission and now under consideration by Government, I believe there is a compelling case for a similarly integrated approach to airport expansion and surface access. For me, this is a critical element in the Commission's consideration of strategic options for future investment in large scale transport infrastructure improvements in London.

I understand the political challenges but believe the omission of HS2 and airport capacity from the Commission's consideration is unfortunate to say the least.

For example our privately promoted integrated proposals allow;

- phased delivery of additional airport expansion aligned with demand, air quality and noise targets and surface access capacity,
- lower capital cost allowing all necessary and airport related surface access infrastructure enhancements to be privately funded,
- Crossrail Express services to relieve capacity constrained Great Western Main Line long distance services, increasing commuter capacity in the western corridor and maximising Crossrail's operational efficiency to the west of London,
- New cross-regional through rail services between Basingstoke, Guildford, Woking and Paddington, (via Heathrow), relieving capacity constrained South West Main Line services and congested LUL services from Waterloo and providing passengers from the South West with a direct connection to Crossrail.
- Extending Piccadilly Line services to connect to the Great Western Main Line and Crossrail at Heathrow Hub

This integrated approach is capital effective and revenue positive, providing benefits to both airport and non-airport passengers. It also provides the significant impacts on air quality and carbon emissions that is secured by modal shift from car to rail, not only in the event Heathrow is expanded but also as it continues to grow incrementally as a result of increasingly large aircraft and load factors

In contrast, current plans require significant public monies to deliver sub-optimal results. HS2 intends to fund a replacement depot for Heathrow Express, maintaining this premium service which uses 20% of Great Western Main Line capacity whilst achieving maximum load factor of 30% in the three hour am peak.

The proposed Western Rail Access to Heathrow scheme will, on the Airports Commission's analysis, achieve even lower load factors and will require continual revenue support whilst occupying increasingly scarce and valuable line capacity.

My plea is twofold. Firstly that the Commission brings creative thinking to explore potentially viable strategic options for future private investment in large scale transport improvements in the west of London which would make significant contributions to both the capital and the wider SE region. Secondly that specific attention be given to developing a scenario for sorting out the apparent problems and issues at Euston and Old Oak Common by seriously considering the benefits of the innovative Cross City Connect proposals developed by BuroHappold for a new rail tunnel linking west London with HS1 via a new underground South Bank Central Station between Waterloo and Southwark, with a potential future station in the Barking area before connecting with HS1 north of Ebbsfleet.

Integrated strategic leadership in all these issues is what many of us hope will emerge from the Commission's work! Obviously I would be happy to discuss this further with the Commission.

[contact redacted]

The views expressed by me in this very brief submission are personal and do not necessarily reflect the position of either Heathrow Hub Ltd or Runway Innovations Ltd

Dear Sirs,

As a professional in the transport and planning field, and an occasional user of the London transport infrastructure (mainly as a cyclist - its the fastest mode inside zones 1 and 2, and beyond), I write to offer comment on the call for evidence in respect of the London Transport infrastructure.

I think there are really only two issues in respect of London's transport infrastructure; the level of subsidy it attracts, and the level of provision. Both, in my view, are so disproportionate as to make the provision to all other parts of the UK, and especially the North of England (which for no obvious - or outstanding - reason has been singled out as lacking transport infrastructure), look pitiful. In fact, this is a misnomer. Transport infrastructure provision in the UK is simply being directed in several wrong directions at once. The actual level of infrastructure provision in London is significantly better than the rest of the UK, but its performance - ability to deliver - is almost equally abysmal as in any other major city. The reason is also the same; concentration of resources on the lowest modal utilisation (the car and conventional rail). These two prevent, in the case of the car, efficient use of the highway and goods delivery by the commercial vehicle, and in the case of conventional rail, restrict capacity, and the provision of that capacity, to perhaps 10% of the potential by the use of outmoded and very expensive technology.

In short, London does not have a problem caused by a lack of infrastructure, but a problem caused by lack of effective infrastructure utilisation. That is simply down to poor management, and since government has run UK transport, de facto since 1914, then it is a racing certainty that those - the great and the good of this evidence process - are at least partially culpable in that failure to manage the London land transport infrastructure so that it can deliver what London needs - fast, cheap, low carbon efficient transport for goods and people.

So investment in more of the same is not going to change anything; in fact doing more of the same de facto prevents change. Only doing something different will make a difference.

London needs to lead the world, not follow it. And it can do so easily on the simple level of planning to cope with the cycling revolution now in full flow in the capital; full provision as if the bicycle was the prime user of the highway, with junctions, priority, parking, recharge stations for assisted cycles, all designed to the exclusion - if required - of everything else. Think of it as we did for the motor car 1960 to 1990. Predict and Provide. Stop regarding cyclists as cads on castors (though a few undoubtedly are!) London's shape, as a structural basin, makes the ride to work downhill, on average, with the sweat reserved for the journey home. Makes Paris look hard work, which it is.

The bicycle on its own will do a lot for London, but it will not do everything, though the cost, less than a single rebuild of a mainline terminus, is eminently affordable. It will however, if properly designed, raise zone 1 and 2 transit speeds (door to door) for people from 3-4mph to about 12mph. Outside this central zone cycling will do more than any other modal shift to assist people and goods flows, but it will not address the medium and long distance people and goods flows on which the capital depends, and on which so much is proposed to be spent in addition to what has already been poured down the black holes of Crossrail, HS1, HS2, Crossrail 2 etc.

No current technology will square this circle, but something new will. Second Generation Rail (2GR). You won't have heard of it. It has nothing to do with rail, except the steel of the vehicle tyres and the material of the metal those tyres run on. It offers a solution to the issue of capacity - perhaps 10-fold over conventional rail - at perhaps 10% of the cost, and can be used on the public highway, or on reserved or segregated tracks with full door to door operability. It is equally amenable to freight or passenger, and requires no modal interchanges or special provisions such as large termini;

calculations suggest large termini would be inadvisable due to 2GR's theoretical capacity, even were they desirable. Over medium distances, say up to 120 miles, 2GR would be faster than the TGV and use perhaps 1% of the energy to do the same task. Based upon road vehicle technology, which has driven the western world's mass production for twelve decades, 2GR is only new in the way it looks at the issues of land transport, and the way steel wheels will run on rails; all the rest we already have in the technology drawer.

So London can choose; more of the same at enormous cost, or something new that will deliver what everyone wants at a price that all in the UK, not just London, can afford and acquire.

Yours Sincerely,

[redacted]

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Unaffordable housing for all except Superrich Need 200+k/y to move to London

Jobs too centralised in Central London

Keeping London the most attractive city to live in the world (critical to maintain advantage as most businesses are based on low taxes and attractive for CEOs and company owners to live and school children

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?
- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

Transport projects should connect new areas of development to new areas for housing so companies employees can choose a house where transport will be connecting to airports/or central connectors

Crossrail 1 and 2 mostly connect existing houses to existing offices, hence it will take a long time for those living to change their existing commuter routes to new jobs etc.

New centres of development at the edge of London or beyond should be planned to become hbs for certain business sectors options are Stratford/Croydon/Luton/Maidenhead Based on that choice transport should be build to areas for future housing
Trains/underground connected to airport/town centre should supplement this development.

Example: IjBurg development in Amsterdam: Bus (later) tramline was running to centre Amsterdam as soon as the first houses were completed, so everyone could plan their commute using public transport

Aix en Provence TGV station was planned in the middle of nowhere which is now a centre of new businesses between Marseille Airport and TGV Station Aix En Provence.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Build where new business areas and housing will be instead of in existing housing and business districts. The change of jobs will result in public transport being used in both directions and unload existing routes (instead of empty trains going out of London in the morning)

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

-
- What innovative funding mechanisms could be considered to support delivery of key schemes? **See Q5**

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

Voorburg Netherlands constructed a road in a ground level tunnel (Sijtwende Tunnel N14) reducing noise, and making land available on top and next to the road for development largely paying for the tunnel. Imagine putting A3 in London into a tunnel with a train/tube line and selling the land above and right next to the tunnel for offices, cycle lanes, other public buildings etc.

I welcome the opportunity to respond to the National Infrastructure Commission.

[contact redacted]

London's transport infrastructure

=====

London has been fortunate to have had significant investment in public transport infrastructure over the past decade. However, as a world city growing at a very fast rate, transport infrastructure remains "behind the growth curve". A key part of the commission's work must be to build consensus on transport infrastructure to avoid rejection of bills in Parliament, as the original Crossrail bill suffered in 1994.

The delay caused by the 1994 rejection set back both Crossrail 1 and Crossrail 2. The result is that Crossrail 2 is effectively solving yesterday's problems, not preparing the city for the challenges of the future. However the worst part is that Crossrail 2 is being proposed with no view as to what large-scale schemes will be needed afterwards.

This is a critical flaw that must be rectified.

Question 1

=====

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The economy of London has become increasingly centralised, placing rapidly increasing demand on rail-based commuter services. The rise in housing costs in Central London only exacerbates the problem, with increasing numbers of people seeking to travel in from homes in zone 4 and beyond.

Two major schemes will alleviate this in 2018/2019 - Crossrail 1 and Thameslink. However, there is currently a gap of over 10 years to the opening of the next potential major schemes in 2030/2031 - Crossrail 2 and the Bakerloo Line Extension. It is entirely right to fear what 10 years of growth could do to the quality of commutes and safety of services. Ultimately, there must come a point at which bright, motivated people look elsewhere for a better standard of living. The danger is that 10 year gap between major scheme openings may simply be too long.

To put this in perspective, rail growth of 4% year on year results in a doubling of passengers in just 18 years. Since the opening of Crossrail 2 is 15 years away, it can be seen that the existing services in South West London may need to handle growth of 80% or more. It can be argued that this is simply not feasible, even if every seat is removed from trains.

Given the potential harm of relentless growth, the commission should consider whether London needs one or more tactical interventions targeted to open around 2025. One possibility might be express, no-station, tunnels for fast lines, which could be developed quickly as the lack of stations creates fewer planning or construction issues.

Another possibility might be tram systems for areas in zones 1 and 2 such as Hackney to Camberwell, again because tram schemes do not have tunnelling and can be progressed quickly.

It must be noted that the Network Rail long term planning process continues to highlight very high growth in demand on services beyond Greater London. It is already common to see standing for 60

minutes from places such as Winchester. Given the long distance rail infrastructure is at maximum capacity along the SWML (South West Main Line) and GEML (Great Eastern Main Line), there is real risk to economic growth.

(Maximum rail capacity on a two track line should be defined as 24tph (trains per hour) where each train is 12 carriages. While minor variations on this may exist, these maximums have been relatively constant for many years.)

Question 2

=====

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

London does not have a vision for large-scale investments beyond 2030.

The impact of this on decision today is explored in the answer to question 3. In this answer, I will outline three potential strategic investments that could be considered.

Extending the Metropolitan and Crossrail 1 in South East London

The Metropolitan line terminates at Aldgate in the City of London.

This is a waste and a classic example of how areas south of the river miss out on metro services.

For the past few years, there has been a proposal to demolish and redevelop the site just south of Aldgate station. In my opinion, TfL should be taking advantage of this unique opportunity to prepare for an extension of the Metropolitan line to Abbey Wood.

The proposal would close the existing Aldgate station, taking the line down and under the District line to a new Aldgate South station on the site mentioned above. A new four platform station would be built, with two Metropolitan line platforms beneath two District line platforms.

The Circle line would cease to run from Tower Hill to Liverpool Street, and the Hammersmith & City line would cease to run from Liverpool Street to Aldgate East. (This greatly simplifies one of the most complex metro junctions in London.)

From the new Aldgate South station, the potential would then exist to extend the line south. My preferred route is to City Hall (London Bridge), Bermondsey, Surrey Quays before surfacing and taking over the existing line through Deptford, Greenwich, Woolwich and Abbey Wood.

Bermondsey would be built as a cross-platform interchange with the Jubilee line, thus passengers from the Greenwich area wanting the West End would have an easy change.

This proposal is intended to be completed in association with a Crossrail 1 extension to Dartford. Rather than needing to build two additional tracks, the Crossrail 1 trains would use the existing tracks to Dartford. Passengers using the current Dartford to Greenwich through service would instead use the high frequency Crossrail 1 service to Abbey Wood and change to the high frequency Metropolitan line service to Greenwich.

It must be emphasised however that this proposal depends on securing and safeguarding the development site south of Aldgate.

Additional Crossrail-style schemes

The primary mechanism to provide the necessary capacity is likely to be Crossrail-style schemes. To meet the growth curve, London needs to be targeting a major opening every 8 to 10 years, something that is considerably more aggressive than achieved to date.

Looking at the areas of London that could be served and could accommodate growth, there is probably a role for at least two more Crossrail schemes. Due to history, there are many more suburban lines south of the river. As such, logic dictates that at least one future Crossrail line will need to run from south of the river to Central London and back to south of the river. The main corridors left to be served would be:

- west towards Putney, Richmond, Roehampton, Hounslow
- south, towards Streatham, Sutton, Crystal Palace, Croydon
- south-east, towards Lewisham, Dartford, Orpington
- east, along the Thames

The most logical grouping would thus be west to south-east and south to east. (Note that areas in the North of London are already well served by the tube, with areas in the north-east served by Crossrails

1 and 2, and areas in the west served by Crossrail 1. The main target for a Crossrail scheme in north London would probably be the Metropolitan line, which might be added to the list of possible corridors.)

Crossrail 1 included some provision for Crossrail 2 in the design of Tottenham Court Road. Without the wider vision for London beyond 2030, it is likely that opportunities will be missed and mistakes made in developing Crossrail 2.

For example, looking at the outline of schemes above, it should be clear that at least one additional Crossrail will run via Clapham Junction (either the west or south corridors). Given this, it is absolutely vital that Crossrail 2 is built with at least passive provision for a four platform station with cross platform interchange at Clapham Junction.

Furthermore, it should be clear that at least one new line will need to run along the Charing Cross - Blackfriars - Cannon Street corridor, and as such this alignment should be safeguarded.

Eastern long-distance express line

At some point soon, the Brighton Main Line will be full. The Great Eastern Main Line will also be full. One possibility is to link them in a true large-scale project.

One possible routing would run from Gatwick to Canary Wharf via Bromley and Lewisham. Such an approach would be a game changer for Bromley, with journey times to Canary Wharf of less than 10 minutes.

From Canary Wharf, the line would continue on in tunnel to Stratford before surfacing and running next to the M11 to Epping. At Epping the line would divide, with one branch running to Chelmsford and the other to north of Harlow. Journey times from Epping and Harlow would also be transformed.

This is of course a very expensive scheme. Despite relatively few stations, it has major tunnelling and surface construction costs. It would likely link into expansion at Gatwick or Stansted airports, or major housing zones (such as at Oxted, Biggin Hill, or North Weald). That said, it would certainly meet the criteria of widening the number of people able to access Central London jobs.

Question 3

=====

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

First, lets consider Crossrail 2 in South West London. Currently South West Trains operates three distinct service groups - Long-distance (to Exeter, Southampton, Portsmouth, etc), Outer suburban (to Guildford, Woking, Dorking etc) and Inner suburban (to Shepperton, Kingston, Hampton Court, Chessington and Epsom). Unfortunately, the SWML only has 4 tracks, 2 fast and 2 slow, with the Outer Suburban services shared between the fast and slow. In essence, Crossrail 2 exists to provide an additional 2 tracks making 6 in total, allowing each of the three service groups to operate independently. Unfortunately, there are still two key conflicts which limit the benefits of the scheme.

The Raynes Park conflict

The first conflict is at Raynes Park, where the 20tph Crossrail 2 service interacts with the services to Dorking and Effingham Junction.

This conflict will require Raynes Park station to be completely rebuilt with complex and expensive flyover junctions. The Dorking and Effingham services also have to fight for space on the 2 track section from Epsom to Raynes Park, restricting the frequency of Crossrail 2 service to Epsom and Chessington, and slowing down the Outer Suburban services. The conflict between the two service groups will also hurt reliability.

My proposal to tackle this is the 'Mole Valley Link'. It proposes a new railway line from Leatherhead to Claygate. This route runs through open countryside and would require minimal tunnelling. It also runs near potential housing development sites at Malden Rushett, south of Chessington, where there is potential for a new station.

All services from Dorking would run via the 'Mole Valley Link', stopping at Leatherhead, Claygate and Surbiton, instead of Epsom.

While this is a longer route, the higher speeds and lower conflicts would provide a suitable journey time. The proposal works well because it gets the Dorking services onto the Outer Suburban tracks at Surbiton rather than at Raynes Park. This greatly simplifies the work needed at Raynes Park. (With the 'Mole Valley Link', only Crossrail 2 services meet at the Raynes Park junction.) It is possible that the cost savings at Raynes Park may be sufficient to pay the cost of the 'Mole Valley Link'.

To complete the picture, Crossrail 2 services would run to Leatherhead via Epsom. Services from Effingham Junction would run via Sutton. The 'Mole Valley Link' would also allow Dorking services to be extended to start from Horsham. This would provide a small amount of relief to the line through East Croydon, widening the benefits of Crossrail 2 even further.

The Earlsfield conflict

The second conflict is the need for Outer Suburban services to serve Earlsfield. The station at Earlsfield is in zone 3 and currently served by Inner suburban services. TfL's current plans take Crossrail

2 via Balham. As such, Earlsfield would not be served by Crossrail 2.

Despite being an Inner Suburban location, at least some Outer Suburban services will be required to stop there. This is a clear conflict.

Passengers from Dorking, Walton, Weybridge and Effingham do not want to have their services stop at Earlsfield but will be forced to simply because the operators will have no other choice. The Earlsfield stop constrains the ability to maximise the Outer Suburban service, with 18tph being the maximum likely rather than the theoretical maximum of 24tph. Despite this, Earlsfield is still likely to see a cut of over 33% in services stopping, something TfL appears to want to avoid talking about.

My proposal to tackle this is the 'Swirl-Max' plan. It proposes to take the main line of Crossrail 2 via Earlsfield between Wimbledon and Clapham Junction. 20tph would run via Earlsfield, with the remaining 10tph taking a branch from Clapham Junction to Balham and on to Streatham. From Streatham, the branch would surface and completely take over the existing line through Haydons Road to Wimbledon, where the branch would terminate.

The 'Swirl-Max' proposal vastly increases the areas that benefit from Crossrail 2. Streatham is a fast growing area already, with the existing station seeing growth of 10% year on year, compared to 3% to 4% at most stations on the SWML. In addition, Streatham still offers considerable development potential, far more than many other Crossrail 2 stations along the SWML.

The 'Swirl-Max' route would provide 10tph to the Wandle Valley Opportunity area at Haydons Road station, which currently receives just 2tph. There is also the ability to create a new station at the A24 serving St.Georges hospital and driving developments in Colliers Wood and south Tooting.

Beyond these locations directly served by 'Swirl-Max', there is potential to link to development sites to the south at Mitcham and Hackbridge. Although the 'Swirl-Max' proposal does not propose taking Crossrail 2 to those areas, it does propose that the existing Thameslink service via Haydons Road is diverted to run via Mitcham Eastfields and Hackbridge stations (and on to Sutton, St.Helier and Wimbledon). This would double the service frequency to 4tph through these areas, driving development benefits linked to Crossrail 2.

Finally, it should be noted that 'Swirl-Max' provides a way to serve both Balham and Tooting, rather than one or the other. With four stations near the Northern Line, the relief gained is likely to be better than TfL's own scheme. (TfL's scheme is flawed in that it allows passengers from Raynes Park and beyond the ability to change onto the Northern Line. Since the journey to London Bridge and Bank will be quickest via the Northern Line, the likelihood is that TfL's plan will make the Northern Line worse, not better.)

Thus, while 'Swirl-Max' may be slightly more expensive than the TfL scheme, the benefits that accrue are significantly greater.

Chelsea

Crossrail 2 proposes a station at Chelsea which has proven unpopular with residents. Removing the station would save costs and speed up journey times for South West London. Alternatively, re-routing the line via Battersea Power Station would link to the Vauxhall Nine Elms area that is likely to need additional transport provision over and above the Northern Line extension.

Crossrail 2 in Central London

Crossrail 1 provides four double-ended stations in the heart of zone 1

- Bond Street, Tottenham Court Road, Farringdon and Liverpool Street, plus Canary Wharf. By contrast, Crossrail 2 provides just one double-ended station at Tottenham Court Road.

The provision of a single "destination" station will focus demand on the line. A major concern must be that dwell times there (the time it takes to get everyone on and off the train) will exceed the time available to run a 30tph service. The provision of a second central London station should be a requirement of progressing Crossrail 2.

The best option for such a station is under Jermyn Street, with one end linked to Green Park station. This has the advantage of linking to the Jubilee line, broadening the benefits of Crossrail 2 via interchange. It also further relieves the Victoria line, avoiding the tendency for passengers to clog up the tube with "last mile" journeys to the Green Park area.

Passive provision

As noted in the answer to question 2, the lack of a strategic vision for new lines beyond Crossrail 2 will cause decisions to be taken that may prove to be unwise. Specifically, there is a high likelihood of a future Crossrail line (Crossrail 3 or 4) being routed via Clapham Junction. As such, passive provision for a four platform cross-platform interchange at Clapham Junction is vital.

As it happens, the two branches of the 'Swirl-Max' proposal could be the basis of this Crossrail 3 or 4. One branch would be allocated to Crossrail 2 and the other to the new Crossrail line.

The passive provision point is important. Crossrail 1 has built two tunnels in the east, one to Stratford and one to Canary Wharf.

Unfortunately, this means that both tunnels will be relatively under-used assets, with the services split between the two at a location too close to Central London. However, on more than one occasion I have been told that it will be hard to split Crossrail 1 because there was no passive provision for it. (Apparently, the engineering to build a new sub-surface junction on Crossrail 1 is hard.)

Being more aggressive

Given the demand curve, one option is to be more aggressive with Crossrail 2. It seems clear that there is enough demand for two Crossrail lines to open in 2030, not one, but there is limited scheme management capacity in TfL and bill time in Parliament. One way to catch up the demand curve is to build four tracks through Central London from Victoria to Euston on the Crossrail 2 alignment. This is simple to achieve in engineering terms, as the tunnel boring machine planned to run from Wimbledon to Victoria would simply be extended to Euston. Using the same alignment also avoids extra scheme management time or Parliamentary bill time. To manage immediate costs, trains from

the South West would terminate at Euston, while trains from the North would terminate at Victoria, acting as two independent services.

With this duplicate core section, it would then be easy to extend on from Euston and on from Victoria as a follow on scheme. In the north, enough capacity would be available to send a branch to Stratford and the Lower Thames area. In the south, enough capacity would be available to properly relieve the Northern line and serve areas further south.

The key is the realisation that the most expensive stations on Crossrail 2 are the Central London ones, and as such it may make sense to build them once with four platforms, rather than building them with two platforms and having to return later to expand them. While it sounds expensive, the likelihood is that the additional cost would be of the order of £2bn (£500m for extra tunnelling and £500m extra for each expanded station). This makes the concept a very cheap way to lay the foundations for future extensions.

Costs

There appear to be limited ways to reduce the cost of building Crossrail 2 as currently planned. The station at Wimbledon must be a major target for cost reduction, with 'Swirl-Max' proposing a fast line tunnel to avoid expensive demolition and construction work.

There is one more radical possibility however. If the 'Mole Valley Link' and 'Swirl-Max' were both adopted, then Crossrail 2 could be completely separately from Network Rail (by dropping the Hampton Court branch and Waterloo services to Kingston). Such a separation would allow a change in the technology used for Crossrail 2.

The alternative technology would be the "DLR-style" automated metro that was identified in the 2013 Regional vs Metro consultation. A DLR-style automated metro technology could allow 40tph of shorter trains to provide the same capacity, requiring lower cost shorter platforms. An automated metro is likely to also have lower operating costs.

Question 4

=====

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Funding is not my specialist area. However, I believe that all taxpayers in London should pay a transport investment levy to help fund large-schemes. In addition, development sites near locations that receive transport upgrades should continue to pay a levy.

To broaden the tax base to those that live outside Greater London, two additional areas should be considered. Firstly, those living inside the M25. Secondly those living in districts clearly linked to the London commuting economy. The latter category is subjective, but it would be wise to provide an objective way to classify boroughs near London, such as by the percentage of workers that commute to locations inside the M25.

Question 5

=====

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London

Barcelona's new metro line 9 offers a novel construction technique which does not appear to have been examined in London yet. Rather than constructing twin tunnels, each large enough for a single track, Barcelona line 9 uses a single large Tunnel Boring Machine to create a tunnel large enough for 4 tracks (2 on the top deck and 2 on the lower deck). Rather than using the extra space for tracks, the project chooses to use the space to construct the stations within the tunnel, dramatically reducing the cost of building each station. Since stations are the most expensive part of an underground railway, this technique should definitely be evaluated for London.

Summary

=====

While Crossrail 2 should be supported, it is not without flaws. The 'Mole Valley Link' and 'Swirl-Max' proposals tackle the key issues south of Clapham Junction, while an additional station at Green Park would tackle the flaws inside zone 1. Taken together, these three proposals would greatly increase the benefits linked to Crossrail 2, and the potential for development.

A more aggressive approach would be to build four tracks between Euston and Victoria, with the northern and southern halves of Crossrail 2 overlapping. This has a low additional cost, perhaps around £2bn, but lays the foundation for future extensions that do not have the complication of development in Central London.

Beyond Crossrail 2, extending the Metropolitan line to South East London is worthy of further study, simply because it would be relatively cheap.

Finally, London lacks a wider vision for large projects. This needs to be rectified urgently, as without it decisions on Crossrail 2 may not take into account the wider future context.

[redacted]

Innovate UK

The Innovate UK response to the National Infrastructure Committee's call for evidence on London's Transport Infrastructure.

1. Innovate UK is the UK's innovation agency, a non-departmental public body sponsored by BIS. It is the prime channel through which the Government incentivises innovation in business. Innovate UK is business-led. Our governing board and executive team is comprised of experienced business innovators and experts. We work with people, companies and partner organisations to find and drive the science and technology innovations that will increase productivity and exports and grow the UK economy.
2. We are working to:
 - Accelerate UK economic growth by nurturing small high-growth potential firms in key market sectors, helping them to become high-growth mid-sized companies with strong productivity and export success;
 - Build on innovation excellence throughout the UK, investing locally in areas of strength;
 - Developing Catapults within the national innovation system, to provide access to cutting edge technologies, encourage inward investment and enable technical advances in existing businesses.
 - Working with the research community and across government to turn scientific excellence into economic impact, and deliver results through innovation.
 - Evolve our funding models to explore ways to help public funding go further and work harder, while continuing to deliver impact from innovation.
3. In line with our strategy¹ we operate across Government and advise on policies which relate to technology, innovation and knowledge transfer. We also support Government departments to become more efficient by supporting them in developing innovative solutions through harnessing the creativity that businesses can offer.
4. Innovate UK was established in July 2007 (as the Technology Strategy Board). We have committed more than £1.5 billion to date and independent evaluations have established that overall Innovate UK has created over £6 of GVA for every £1 it has invested and 7 jobs for every business it has invested in. Over the last 8 years this has added up to delivering a total of £7.5Bn and 35,000 jobs. The private sector more than matches that investment, doubling the power of public sector money, and we have directly supported over 6,500 companies. We work with nearly every University in the UK to stimulate the commercialisation of leading-edge academic research and innovation.
5. Transport Systems as well as vehicle technology across Automotive, Aerospace, Marine and Rail have had a major focus within Innovate UK over the last eight years. We have placed significant investment in collaborative R&D partnerships, driving growth within businesses and supply

¹ 'Concept to Commercialisation: A strategy for business innovation, 2011-2015'.
https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/360620/Concept_to_Commercialisation_-_A_Strategy_for_Business_Innovation_2011-2015.pdf

chains, both nationally and for exports. These areas continue to be prime focal points as we build on success in these sectors of national importance by delivering the Advanced Propulsion Centre and Aerospace Technology Institute programmes on behalf of the Department of Business, Innovation and Skills.

6. The Transport sector has grown into one of Innovate UK's key priorities. Our aim is to help innovative UK businesses to take advantage of the opportunities that a rapidly changing transport system will present, both in the UK and in overseas markets. Over the last parliament we have invested up to £70m per year of our core budget in support of hundreds of innovative businesses developing new products across the transport sector, from new powertrain technologies for low emissions buses, through to low noise aircraft systems and intelligent mobility services. Our focus from 2007-2015 grew from the Low Carbon Vehicle Innovation Platform to cover Aerospace, Rail, Marine and Transport Systems.
7. Innovate UK supports businesses in two main ways. Firstly, we provide funding to allow development of high potential, ground-breaking new technologies and products that are too early and too risky for the private sector to fund alone. Secondly we help businesses connect to the right partners, expertise, test facilities, financiers and influencers that can accelerate their route to market. A key component of innovation is knowledge exchange through networks. To drive this at a national level Innovate UK has invested £1.5bn in establishing world leading Catapult centres, which are designed to transform capability for innovation in specific areas of specialism to enable future economic growth. These centres launched by Innovate UK, provide critical expertise and test facilities to businesses in developing new products. Within near reach of London with a focus on transport challenges we have Transport Systems and Satellite Applications, and inside the capital we have the Future Cities and Digital Catapults. Additionally, the national network of High Value Manufacturing Catapults are extremely important for grounding the manufacturing of new transport technologies in the UK.
8. The demand for transport and its infrastructure is proving to be a critical challenge for the UK in enabling businesses to function and to support economic growth through the movement of people and goods. Notwithstanding social development, wellbeing and environmental impacts, we see great potential in balancing demand and optimising connectivity through evaluation of new innovations and technologies and how these trends can offer greater utilisation of the national transport infrastructure. Equally advancements in new innovation for asset management and connectivity can provide cost savings in operational maintenance for local authorities.
9. We have shown how major demonstrations of new innovations and technologies, such as electric vehicles, can attract international investment into the UK and accelerate market adoption of low emission technologies and reduced risk for industry to bring new products to market. New business models provide value across the range of transport issues and we have also seen valuable insights into the complexities of the network users and how disruptive and innovative thinking can drive a change in behaviour towards transport.
10. Expertise and sector knowledge at Innovate UK can bring significant change in the transport market. Through working closely with industry and evaluating past projects Innovate UK provide timely and value added interventions to drive supply chain growth and productivity. We demonstrate how the collaboration across industries can open new value to capture and meet the future challenges of transport.

11. The value of working closely with UK Governments on specific societal challenges can bring about timely change in regulation and standards to match the pace of technology and innovation and how these drive new customer demands. Projects funded through Innovate UK show how risk reduction through targeted innovation investment can overcome perceived challenges and drive collaboration across industries on a common challenge. Innovate UK welcomes the National Infrastructure Committee's inquiry into London's Transport Infrastructure. Set out below is our response to the questions raised by the Committee.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

12. London's ability to move people and goods over the next two to three decades to support economic growth and social wellbeing will be challenged by the limited transport network capacity through its geographic constraints and how it has evolved in construction terms as a city over the years. Increasing population through migration, aging and urban growth, places significant challenges onto London and its existing transport infrastructure.

13. Drivers spent more than 250 hours idling in London traffic in 2013, which is double the UK average – and this is set to increase to 299 hours in 2030, equivalent to 40 working days a year. Although less than a third of Londoners commute to work by car, the cost of living and the value of time for the capital's 1.4 million car commuters is at such a premium that in 2030, it is estimated London will incur £9.3 billion from traffic congestion, an increase of 71 percent from today, costing each car commuting household more than £4,000 a year by 2030.

14. The commuter today is already witness to train overcrowding and congested roads and the frustrations and stresses in the daily commute. Today's rail commuters already consistently exceed available capacity in and out of London during the morning and evening peaks (demand is 104% of capacity) and these trends look set to continue. Demand exceeds capacity at mainline stations including Paddington at 110%, Moorgate 108%, Blackfriars 108% and St Pancras 107%.

15. Improving public transport reliability, predictability and accessibility will be challenging for the transport system of the future due to increasing demand from a diverse demographic as well as vehicle and connecting infrastructure security. Other social challenges include safety for pedestrians and cyclists. Additionally the commuter, traveller and tourist face air quality concerns.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

16. There are a number of options which include:

- enhancements in signalling (through ERTMS or ETCS) on the existing mainline network, which has the potential to significantly increase capacity by enabling closer running of rail services;
- further roll out of future rail technologies - such as autonomous tube rolling stock (as in use on the DLR);
- electrification of non-electrified London stations will contribute to an accelerated rail timetable and in addition to investing in large-scale transport infrastructure, a range of incremental gains may also be realised by strategic delivery of a range of lower-cost options to enable faster passenger loading, dwell times at stations, optimised train driving aids and smart technology to support passengers in making informed travel choices;

- the strategic consideration towards the reduced use of the private car in central areas and incentives towards zero emission vehicles. Better use of park-and-ride out on the peripherals of the city such as the M25, with driven or driverless/autonomous vehicles serving individual's needs in accessing the city;
 - to benchmark international initiatives such as Frankfurt, Amsterdam, and other large EU cities that have tackled these issues, e.g. wide use of street-level trams, simple ticketing, transparent and cost effective pricing, radial as well as axial routes to encourage businesses to site themselves out of the city centre;
 - a strategic and tactical view to consider new business models in how operation of local transport such as taxis and buses can enable a more on demand service rather than traditional methods of delivering a public transport services;
 - a push for greater optimisation of the River Thames as a means of moving people and goods efficiently, providing greater physical connectivity with additional bridging. Providing better commuter and traveller information through enhanced and accurate information through wireless connectivity;
 - infrastructure investment should also consider the optimisation of transport within London as a system. Using innovations in infrastructure intelligence to drive greater intermodal connectivity and ways of balancing the transportation network;
 - to build upon the demonstrated benefits of smart infrastructure by the Cambridge Centre for Smart Infrastructure² to realise those benefits across the whole lifecycle of future infrastructure projects, from design and construction through to operation; and,
 - to support shifts in propulsion systems, alternatively fuelled vehicles need infrastructure including rapid electric charging points and hydrogen refuelling.
- **How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
17. Priority should take into account the ability to smooth transportation flows and optimise capacity. Connectivity to jobs and businesses drives economic growth, reducing journey times and congestion enables greater mobility of both people and goods. This could be achieved through an in-depth study, ideally with the support of specialist agencies including the DfT, TfL, modelling tools. This could be done through the Transport Systems and Future Cities Catapult and other specialist agencies as appropriate.
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**
18. We would recommend a study ideally with the support of specialist agencies including the DfT and Transport for London to assess trends in innovation and technology and matching that with population, migration and business growth forecasts. This would assess the impact of large-scale transport infrastructure improvements in London on employment, productivity and the supply of housing.

² The Cambridge Centre for Smart Infrastructure is an Innovation and Knowledge Centre, jointly funded by Innovate UK and EPSRC to bring research into smart infrastructure into practice through a series of technology demonstrations with industrial partners. Led by Professor Lord Mair, CSIC has been involved in both Crossrail and the London Bridge upgrade project to demonstrate the benefits of smart infrastructure and are in discussions with all the major infrastructure projects to continue this work. See <http://www-smartinfrasturcture.eng.cam.ac.uk/who-we-are>

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

19. There are opportunities for Crossrail 2 to be explored through modern digital engineering practices, such as smart infrastructure and maintenance. Condition monitoring systems and intelligent sensors would help to reduce operational costs. The digital revolution is enabling greater mobility of people through smart ticketing, ticketless barriers and greater system connectivity. Learning from industrialised sectors such as Aerospace and Automotive in the design and development of long term programmes and process innovations should be explored by the construction sector and therefore encouraged by the public sector procurement. Specification freeze, engineering change control and complete design for manufacture ownership are lessons that can be learnt.
20. It is expected that the proposed Crossrail 2 project will be fully BIM level 2 migrating to level 3 compliant (a project heavily supported by Innovate UK), and will be able to benefit from the legacy of Crossrail 1 and other mega infrastructure programmes such as Thames Tideway and HS2 phase 1.
21. Further benefits could be realised through the use of novel building methods such as offsite manufacture in the construction phase. Equally instilling a culture for innovation within the programme and driving innovative practices into the development frameworks from the funder should challenge traditional design and engineering practices, standards and regulations and drive new methods for assessing risk through a balanced portfolio. To drive innovation into the supply chains through accelerated procurement specification and requirement capture to deliver a more cost effective railway, rolling stock, system and construction.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

22. This is for others more expert in the delivery of large-scale transport infrastructure to comment.
 - **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
23. This is for others to comment.
 - **What innovative funding mechanisms could be considered to support delivery of key schemes?**
24. A funding scheme that considers and drives cross sector innovation. To include transport modes, digital, construction, local regions and attracts emerging non transport industries to provide innovative systematic products and services in the design and operation of the transport system.

These could include Innovate UK's SBRI³ and CR&D⁴ mechanisms and the national Catapult centres⁵, supported by a London Innovation Fund.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

25. The challenges facing London are very similar to other cities globally, as population growth and the demand for transport, travel and social wellbeing drives expectations of the transport network. In many cases demand is outstripping supply. These lessons are being learnt by London. Global benchmarking and collaborations would provide accelerated learning and reduced trial costs.

ICE written submission to the National Infrastructure Commission call for evidence – London’s Transport Infrastructure

Dear Lord Adonis,

Please find the Institution of Civil Engineers’ submission to the National Infrastructure Commission call for evidence on connecting northern cities. This submission is an output from ICE London region.

The ICE is a UK-based international organisation with over 86,000 members ranging from professional civil engineers to students. It is an educational and qualifying body and has charitable status under UK law. Founded in 1818, the ICE has become recognised worldwide for its excellence as a centre of learning, as a qualifying body and as a public voice for the profession.

In London, ICE supports and represents over 9,000 members living and working in the capital to actively promote civil engineering with industry, schools, universities, local government and the media. Further details from www.ice.org.uk/london

We welcome the opportunity to respond to the National Infrastructure Commission on the pressing issue of London’s transport requirements over the next 20 to 30 years. We have kept our response brief and focused on key points. Our members have much to offer in terms of expertise and would welcome the opportunity to further assist the Commission in its work.

Yours sincerely,

Suzanne Moroney
Director, ICE London and South East England

National Infrastructure Commission Call for Evidence - London's Transport Infrastructure: ICE London Response

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The major challenges facing London and the wider South East are undoubtedly the anticipated population growth, the related problems of capacity constraints across all types of infrastructure and a long term problem of building too few homes to accommodate the growth in households.

The [London Infrastructure Plan 2050](#) (LIP 2050) sets out a projected population growth of over 40% by 2050, bringing London's population to over 11 million.

Much of London's infrastructure is already at or close to capacity. Commuter lines into London and the tube network frequently experience overcrowding. Significant parts of the Capital's main highway network are already stretched to and beyond their practical capacity with the result that whole areas can frequently become gridlocked. London and the South East are likely to need a new water resource within the next 25 years. Increased pressures on electricity mean that we need to an improved approach to demand management.

Housing regularly tops Londoners lists of concerns, based on exceptionally high selling and rental prices, as well as over-occupation. An estimated 49,000 homes¹ are required per year to 2050, significantly more than has been built in London in previous years.

A lack of affordable housing and increasing pressures on infrastructure have obvious impacts on Londoner's quality of life. Whilst London still remains an attractive place for young professionals, high house prices could soon see young skilled workers moving out of the city to areas where they can buy or afford to rent a property. If this happens on a large scale, the likely impact is a significant increase in the numbers commuting into London, putting ever greater pressure on the rail network. Others may be put off commuting into London by journey times and/or high fares. Transport operational staff, in particular need to live close to their workplaces.

ICE London believes London's future economic growth will be constrained unless there is sustained investment in the city's infrastructure and housing.

¹ [London Infrastructure Plan 2050](#), page 14.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

There are parts of London with significant space for house building that are currently not being built on. In many cases the reason is simple; these areas do not have effective transport connections. Barking Riverside is a prime example, where brownfield land has the potential for over 10,000 new homes to be built. In the absence of the proposed extension of the London Overground to Barking Riverside, no more than 1,500 new homes are permitted. Such development will bring jobs and economic growth to the area. ***The provision of additional housing and related employment should be planned in tandem with upgraded and new transport provision, and this must be placed at the top of any prioritisation assessment.***

A strategic long term approach is required that maps out London's key transport requirements. A project by project approach will not provide London with the best outcome; it is the combined impact of transport, housing and infrastructure investments that will realise the highest benefits for London.

A decision on airport capacity is urgently needed if London's transport needs, and house building, are to be planned effectively.

The LIP 2050 sets out a strong plan for London's transport investment to 2050, albeit with the need for further prioritisation and an update when the Government makes its decision on airport capacity. The need for future reviews and updates, should not delay implementation of the projects identified as necessary in the nearer term.

Better transport links to the wider South East must also be a high priority. The proposed Crossrail extension to Ebbsfleet and giving Transport for London control of more South East rail routes are crucial in providing better connectivity into London.

Transport for London has identified a wide range of interventions which have positive business cases. We do not propose to rank individual projects here but see a pressing need for two projects in particular, namely Crossrail 2 and the Silvertown Tunnel.

Given its forecast beneficial impacts on transport relief and economic development, Crossrail 2 must be a priority and ICE London is pleased to see a growing consensus from local, regional and national government on the need for the scheme. Many of the benefits of Crossrail have already been seen in terms of unlocking housing growth and ICE London believes that similar gains will be accrued from Crossrail 2.

Similarly, the Silvertown Tunnel is a much needed scheme to alleviate congestion on the Blackwall Tunnel. East London urgently needs a series of river crossings; Silvertown Tunnel should be considered as the first of a number of new multi-modal river crossings to the

east of Tower Bridge. This will open up opportunities for housing and employment growth at the London Riverside, Royal Docks and other Opportunity Areas on both sides of the river. Such schemes have long been regarded by existing employers and potential inward investors as being absolutely top priority.

There are several other schemes with strong business cases, that ICE London believe to be necessary to support London's growth. These include the Barking Riverside Overground extension; DLR extensions; the Croydon Tramlink extension; London Underground major station capacity enhancement schemes.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The Government has the ability to significantly reduce the costs of infrastructure build in London by clearly committing to a long term programme of work. This programme should not be changed at political whim, but revisited periodically and adjusted to reflect changes in the way the city functions or technological advances.

A clear programme of work, that sets out the timeline for major project delivery and commits to funding, will allow the construction industry to reduce costs:

- A long term plan will enable effective sequencing of projects, to either remove clashes for particular skilled workers or allow synergies to evolve e.g. where joint training academies are established.
- Certainty will enable greater investment, which will require a lower rate of return due to the lower risks of the project being stalled or abandoned.
- Planning for their workforce now – this will ensure there are adequate numbers of skilled workers, and avoid the need to pay excessive wages to those with skills in short supply. It will also reduce delays.
- Planning their supply chain now – this will reduce delays and the cost of sourcing materials and component parts. This will have the added benefit of allowing firms around the UK to gear up to supplying projects such as Crossrail 2, avoiding the need to source materials from abroad.

The London Infrastructure Plan 2050 and the Mayor’s Transport Strategy need to be articulated into a programme of work that sets out and sequences the key infrastructure projects and development sites over the next 20 years.

ICE London believes this is the single most effective way to reduce costs. A decision is urgently needed on airport capacity to enable a realistic programme of work to set out.

On Crossrail 2, there are likely to be further efficiency savings that are possible. For example, by exploiting the potential benefits of BIM and adopting best practice contracting and procurement. On major projects additional money is often spent at interfaces with other infrastructure owners and utility companies. This is where the risks are. Early engagement and buy in from all parties is crucial to successful, lower risk and lower cost, delivery.

Further innovations may come forward that reduce costs. This is tax payers and fare payer’s money being spent, so every effort needs to be made to make sure it is being spent wisely.

Crossrail has developed much in the way of best practice particularly on skills development and innovation, these need to be captured and built on for Crossrail 2 and other major projects. There will be other areas, that with the benefit of hindsight, can be improved on.

ICE London recommends that infrastructure providers, innovators and academics are brought together and set the challenge to reduce the build cost of Crossrail 2. This should

include a session on lessons learned from Crossrail. ICE London would be happy to convene such a group and report to the Commission on options to reduce costs. Many of the innovations that come forward would likely be applicable to wider infrastructure build.

The benefits of Crossrail 2 will be maximised when it is planned alongside London's wider infrastructure needs. This will ensure the possibilities for integration are taken full advantage of.

For example, designing in energy cooling from the ground around the tunnels to either help cool the tunnels themselves or supply heating and cooling to local building networks around shafts and stations. This was considered too late for implementation on Crossrail, but has been proven to be effective in other European countries.

One of the main benefits of Crossrail 2 is the potential to unlock significant housing growth along its route. ***The potential for the creation of new vibrant communities will be maximised if there is a clear and early commitment to fund and deliver Crossrail 2 to stated timescales.*** Experience from London's Docklands demonstrated that an early physical and hence visible start at least to preparatory works generates early simultaneous inward investment. This will give developers the confidence to start building homes and invest in the public realm aspects of the development that will ensure high quality places to live are created.

As well as branches via the Lee Valley and to New Southgate a further extension serving major potential housing development and Opportunity Areas in east London which would potentially offer additional development related funding towards Crossrail 2 should be considered. A spur has been safeguarded to facilitate a possible extension to east London and the ICE suggests that this is considered by TfL, as well as how Crossrail 2 can improve access to Stansted. An extension from Epsom to Gatwick should also be considered.

Jobs are the other main benefit for London overall and areas along the route, again a clear commitment to Crossrail 2, will allow training schemes to be put in place to ensure local people benefit from the job opportunities created.

The benefits of Crossrail 2 will spread far wider than London, and this must be factored into any consideration of the benefits.

The rail line will serve regional areas outside Greater London and will connect to National Rail networks in Hertfordshire and Surrey, better linking those to the London Underground and national and international services. Crossrail 2, like Crossrail, is forecast to generate jobs around the UK – 60,000 while it is being built and 200,000 once the project is operational².

Crossrail 2 will maximise the effect of other transport investments, particularly those such as High Speed 2, that better connect other parts of the country to the capital; by relieving congestion at key points where National Rail lines meet the London Underground. It would

² TfL analysis

be less than optimal to improve journey times into London, only for passengers to be held up accessing an overcrowded tube network. High Speed 2 arriving into Euston station is the obvious example.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Crossrail 2, along with many of London's other transport requirements have a positive business case and will generate significant additional value for London and the UK as a whole. In the long run, investment will pay for itself through higher productivity, greater revenues to business, increased land and property values, and increased tax receipts for government. The issue is how these gains are captured and used to fund infrastructure investment.

ICE London supports the GLA's pursuit of fiscal devolution. Devolution of the form set out by the [London Finance Commission](#), whereby London retains income from property tax to make self-determined investments in its infrastructure, would provide a source of revenue in itself and provide greater scope to borrow to fund infrastructure. A funding gap will still remain, and alternative funding mechanisms will be required.

Transport investment in particular can have a significant impact on property prices. Crossrail is demonstrating this well, even before it has opened – Whitechapel residents are expected to see a 54% increase in property values, with the average increase along the line expected to be 9%³. As a minimum, the increase in stamp duty and business rates revenue this produces should be available to London, which the city can then borrow against to fund transport projects.

Learning from the Northern Line Extension and similar schemes, there are opportunities to take advantage of local uplifts in land values ***ICE London would like to see mechanisms put in place to allow the capture of increased property and land values for example through the opportunity and compulsory purchase of land parcels along key new transport routes and through additional property taxes in areas that have seen significant increases in property values due to transport investment.***

Crossrail was funded by equal contributions from Central Government, London Government and London business. London businesses were in support of this arrangement and are signalling similar levels of support for a comparable arrangement for Crossrail 2.

It is reasonable to argue that those who benefit should pay, its seem logical that the cost should be shared between National Government (who will gain from increased tax revenues), property developers (who will gain from higher returns), residents (who will see a rise in the value of their property), passengers (who will gain from improved connectivity, reduced journey times and so greater access to jobs and leisure opportunities) and London businesses (who will gain from improved connectivity for customers and employees).

³ [JLL analysis](#)

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

On financing, the Mayor of Chicago Rahm Emmanuel set up a Chicago Infrastructure Trust as a new method of generating private investment for infrastructure projects.

The Trust has funded an energy retrofit programme for 60 public buildings, costing \$12million and recently negotiated a \$32million 4G upgrade of the Chicago transit system. It has also been suggested that the Trust could fund a high speed rail link to O'Hare Airport.

The Trust does not work as a Private Finance Initiative (PFI). Instead, the Mayor would release bonds for the private sector to invest in, whilst ownership and management of the infrastructure would remain with the public sector.

In London, an Infrastructure Trust could be set up in the same way as the London Enterprise Panel, under sections 30 and 34 of the Greater London Authority Act 1999. Should a Trust be set up, it could provide a significant level of funding for projects like Crossrail 2.

Rt. Hon Joan Ryan MP
Member of Parliament for Enfield North
House of Commons
London
SW1A 0AA
Tel: 0207 219 2442
Email: joan.ryan.mp@parliament.uk

Please find below my submission to the National Infrastructure Commission's call for evidence for the CrossRail 2 consultation.

I am responding in my capacity as MP for Enfield North, an area which could benefit substantially from significant infrastructure investment.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The greatest challenge for London and its commuter hinterland over the coming years will be how we can continue to connect people's homes with jobs. Cities are engines of growth, and London is particularly important in driving the UK economy. London's ability to do so relies upon being able to house and then transport a talented labour force to work. But with the population continuing to grow rapidly – by the equivalent two tube trains full of people every week – this is becoming an increasing challenge.

The housing crisis in London, including here in Enfield, has been well publicised. What is clear is that over the coming decades we will need to build significant numbers of new homes. These homes are essential if London is to continue attracting talented people that work in the high-growth sectors that power the economy. But to be viable, these homes must be built around public transport networks. In my constituency, road congestion is already severe in the morning and evening rush hours, partly because existing rail services are not as frequent or reliable as required. While there is potential for new housing development in my constituency, to take this forward without a big improvement in public transport would overwhelm the road network. If we fail to build more homes it will only make the existing challenges worse and damage London's long-term prospects.

Many of my constituents travel into central London to work: severe congestion on the transport network is a daily challenge for many, delaying journeys into work and deterring people from travelling to highly productive and well paid jobs in the centre of London. While planned improvements are welcome, over the next few decades London will need to invest in major new infrastructure projects to provide a major capacity boost. Without the transport network that can connect homes to jobs, London's international position is at risk.

This would harm my constituents. The London-Stansted-Cambridge corridor has had enormous success in attracting high-tech firms which provide skilled jobs. Proximity to a thriving London has been crucial to attracting that inward investment which is needed to drive up living standards in my constituency. In Enfield wages are significantly below the London average and unemployment is persistently higher. London must continue to thrive to create new opportunities for people there and across the whole city.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

My constituency needs public transport improvements in the short, medium and long term to support economic growth. In the short to medium term, Network Rail needs to commit to improving the West Anglia Main Line to provide more frequent and more reliable services.

Currently, services on the West Anglia Main Line (WAML) are severely hampered all the way along the line because the section between Coppermill Junction (just south of Tottenham Hale) and Broxbourne Junction in Hertfordshire – which passes through the Eastern side of Enfield North - consists of only two tracks. Fast and slow services compete for space and as a result, journey times are long for the longer-distance services and frequencies are relatively low for the shorter-distance stopping services. Reliability is also a key concern: if one track is out of action services can become delayed or cancelled.

Providing four tracks could provide the solution, and would also pave the way for Crossrail 2, which would allow up to 30 trains per hour in each direction through central London and connect into the region's existing transport network. Delivered by 2030, Crossrail 2 could unlock tens of thousands of new homes and jobs in the WAML corridor alone. The delivery of four-tracking by 2024 will ensure that this growth can be kick-started ahead of Crossrail 2 opening in 2030. This would provide a step change in accessibility in my area and unlock growth in the Upper Lea Valley, one of London's largest opportunity areas.

It is important that strategic options for future investment in large-scale transport infrastructure improvements focus on maximising the return on investment. This is best achieved by targeting areas with high growth potential, such as the opportunity areas in the Upper Lea Valley. These areas have the most opportunity to unlock economic growth which can pay back the original investment, securing a stable economy. While it is important to invest in cities around the UK, this cannot be at the expense of London. It not only needs investment, but can also provide the greatest return on that investment, growing the national economy. Growth is not a zero-sum game.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Delivering improvements to the West Anglia Main Line in Network Rail's control period 6 (2019-24), with an explicit commitment to Crossrail 2, would unlock significant housing and economic growth years ahead of the railway opening. As we have already seen with Crossrail, significant housing development happens in anticipation of the new railway, and the Upper Lea Valley provides very large opportunities to build some of the tens of thousands of new homes that we need. A commitment to improving the line and progressing Crossrail 2 would help increase the benefits, and deliver them earlier than would otherwise be possible.

Benefits could further be maximised if holistic development plans are drawn up along with transport plans. Enfield Council has developed ambitious plans for new homes, jobs and growth at Meridian Water as a result of local rail improvements. With further commitments to Crossrail 2, these plans could be further developed at other locations in the borough, to maximise opportunities and get the most efficient use of the infrastructure.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Crossrail 2 has developed a funding package where the majority of funding is locally provided. This type of funding model, where Government's contribution is dramatically reduced maximises value and instead focuses planners on how best to design projects that can pay for themselves through greater economic growth, job creation, reduced unemployment and increased tax receipts.

Government needs to demonstrate leadership and commitment to Crossrail 2 by providing the development funding needed to get projects off the ground. That businesses are paying for Crossrail shows that, providing there is a clear Government commitment to infrastructure investment, new funding streams can be secured. This minimises central government expenditure while maintaining the transformational benefits of the infrastructure. With a possible funding structure in place, central Government should provide the £250m needed to develop Crossrail 2 and secure powers to build it in this parliament.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

In Hong Kong, city planners work as part of the railway company to devise development plans which provide a funding stream for the railway. These integrated plans make the most of available opportunities and help pay back the investment faster. Parts of the Upper Lea Valley contain large areas which could be regenerated and support new development should Crossrail 2 go ahead. Mechanisms which capture this value could be developed to provide additional funding streams for the project.

Thank you for the opportunity to respond to the call for evidence.

Regards,

A handwritten signature in blue ink, appearing to read 'Joan Ryan'.

Rt. Hon Joan Ryan MP

Kent County Council response to National Infrastructure Commission re London's Transport Infrastructure

January 2016

Introduction

The right infrastructure is key to growth; however getting the right infrastructure at the right time and getting funding for it is a challenge for many of the priority growth areas of the country.

National government clearly has a major role to play and it is in this context that Kent County Council (KCC) welcomes the National Infrastructure Commission (NIC) as a permanent statutory body. The County Council supports the NIC's preparation of a National Infrastructure Assessment (NIA) which will provide long term strategic vision and establish clear, spatial priorities for the delivery of infrastructure aligned to economic and population growth. The NIA will ensure greater certainty for private investors, and provide greater assurance to local authorities and the development industry that growth is deliverable in a sustainable manner, supported by existing and planned infrastructure.

In November 2015 KCC published the 'Kent and Medway Growth and Infrastructure Framework' (GIF)¹ which comprehensively identifies the significant levels of economic and housing growth planned in Kent and Medway (to 2031) alongside the critical infrastructure necessary to facilitate this level of growth. Infrastructure necessary to unlock growth has been estimated at £6bn of which £2bn is currently unfunded, which if left unaddressed will undermine the long term delivery of sustainable growth in Kent and Medway. The County Council and its partners are now actively preparing a 10 point action plan to take forward the GIF including consideration of the funding models and structures required to deliver identified infrastructure priorities.

KCC therefore welcomes the opportunity to respond to the NIC in respect of London's transport infrastructure. The provision of good, efficient and reliable transport infrastructure in the capital is essential to ensure the free movement of people, goods and services between London and its environs, including Kent. Our county also acts uniquely as the primary transport corridor between the capital and the principal Channel ports of Dover and Eurotunnel.

London's transport infrastructure is not all about infrastructure in London. It is – or should be – about the provision of transport infrastructure which serves the whole of the greater south-east region, supporting the wider growth of the Home Counties which provide a significant proportion of the capital's workforce who are dependent on excellent transport infrastructure to access their employment and so contribute to the gross domestic product of the whole area.

There are a number of key transport initiatives which will have a direct bearing on London's transport infrastructure and its ability to cater for an ever increasing demand from commuter, business and leisure markets. Each of these initiatives is considered in relation to the specific questions posed in the consultation.

¹ The GIF is available to download via www.kent.gov.uk/GIF

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The major economic and social challenges facing London and the greater south-east region over the next two or three decades can only be properly understood in the context of that wider region. The challenges facing London cannot be addressed in London alone; they must embrace the region in which the capital is located and from which it draws its daily workforce. The challenges facing London and its Home Counties must therefore be treated together.

KCC has identified significant increases in employment growth and housing need projections in Kent and Medway between now and 2031. This growth should be recognised as a part of the major economic and social challenges facing the wider south-east region, and the NIC's plans for London's transport infrastructure must be cognisant of these significant economic and social challenges.

Projected Growth in Housing Need to 2031

The following figures for each District in Kent, and for Medway, indicate the forecast level of housing need between 2011 and 2031 (correct at November 2015):

District	Additional housing need 2011-31
Ashford	14,540
Canterbury	16,000
Dartford	17,300
Dover	14,000
Gravesham	6,170
Maidstone	18,560
Medway	24,000
Sevenoaks	12,400
Shepway	8,750
Swale	13,192
Thanet	12,000
Tonbridge and Malling	13,460
Tunbridge Wells	12,960

Projected Growth in Employment to 2031

The following figures for each District in Kent, and for Medway, indicate the forecast level of employment growth between 2011 and 2031 (correct at November 2015):

District	Additional employment growth 2011-31
Ashford	17,200
Canterbury	17,000
Dartford	22,100
Dover	400
Gravesham	7,000
Maidstone	14,400
Medway	20,100
Sevenoaks	7,000
Shepway	500
Swale	9,900
Thanet	5,000
Tonbridge and Malling	7,700
Tunbridge Wells	9,900

Southeastern Metro Rail Services

KCC has taken a very keen interest in recent years in the commuter routes which serve the south-east London suburbs and the western fringes of Kent. An approach from Transport for London (TfL) in 2013 to seek approval from KCC to their proposal for the transfer of the franchising authority for the Southeastern Metro rail services from the Department for Transport (DfT) to TfL was opposed by KCC at this time. The proposal did however present KCC with the opportunity to commission detailed consultancy work on the likely impact of the transfer of these Metro services, on both London and Kent.

The report (attached) provided some very useful data concerning current and projected usage of the south-east London Metro network and highlighted particular concerns, specifically around ticketing and performance issues on certain routes through south-east London to the capital's termini. For the purposes of this response, the WSP report contains much useful data, and the NIC may find some of its material helpful in determining the need for particular infrastructure improvements in the south-east London Metro operating area.

Subsequently, KCC has responded favourably to a new proposal from the Greater London Authority (GLA) for the transfer of south-east London Metro services to TfL. Following an agreement between KCC and TfL which protects the interests of Kent's rail passengers through the inclusion of three 'red lines' in respect of fares, paths and capacity, KCC has now agreed in principle to the future transfer of these services at, or shortly after, the start of the new franchise for the Southeastern operating area in 2018.

2. What are the strategic options for future investment in large-scale transport

infrastructure improvements in London - on road, rail and underground - including, but not limited to, Crossrail 2?

Lower Thames Crossing

For many years KCC has promoted the need for a new Lower Thames Crossing that will cater for strategic traffic and the county's function as the gateway to continental Europe, as well as providing greater connectivity with Kent's immediate neighbours to boost local and national economic activity and productivity. The existing Dartford-Thurrock River Crossing (A282 trunk road) is a significant link in the strategic road network, facilitating the movement of goods and people from Kent across the Thames to Essex and the North. The crossing is used by over 50 million vehicles each year, which is well above its design capacity. This lack of capacity results in congestion and unreliable journey times. Recent attempts to improve the crossing by removing the toll-booths and encouraging free-flow traffic have seen positive results but nevertheless traffic volumes continue to grow at the crossing and congestion will soon return to the levels seen before the improvements.

With the Garden City development at Ebbsfleet comprising a predicted 15,000 new homes, and the proposed Paramount development on the peninsular forecasting 27,000 new jobs, the need for the Crossing is ever more pressing. The delivery of a third crossing is vital to support the future growth of London, the South East and the UK as a whole.

KCC supports the provision of a new Lower Thames Crossing to the east of Gravesend and Thurrock connecting the M2 with the A13 and the M25 between Junctions 29 and 30, including improvements to the A229 to improve the link between the M2 and M20 (known as 'Option C variant' in DfT consultation to date). This option provides a clear opportunity for the DfT to radically improve capacity and resilience of the road network crossing the Thames, but also to provide urgently required resilience for the strategic network across Kent between the Ports (Eurotunnel and Dover), the Midlands, and the North. KCC has commissioned research into the benefits of the new crossing and concluded that Option C variant has the greatest economic benefits, primarily through job creation and housing growth. The improved connectivity resulting from the new crossing would attract businesses to north Kent/south Essex. Improved journey time reliability would enable residents to access more employment opportunities, effectively increasing the size of the labour market.

A KCC commissioned study by KPMG in 2010 concluded that a new crossing to the east of Gravesend would directly create 6,000 jobs and contribute £12.7 billion to local GVA. In a further study, URS (2012) carried out demand analysis showing that the new crossing would improve development viability and unlock economic growth. By implementing Option C variant in conjunction with upgrades to the A2/M2 corridor (M2 Junction 7 improvements and dualling the A2 north of Dover) a second strategic route between Kent and the North would be created, which is vital to keep London and the rest of Britain connected to the Port of Dover. Another study commissioned by KCC (Gowlings, 2012) has shown that there is a high level of interest from potential financiers, meaning that it is an attractive investment that could be delivered quickly by the private sector.

As the growth of London extends eastwards, the infrastructure required to support it also supports Kent. KCC believes that the current level of congestion at the existing crossing, along with forecast traffic growth and the significant scale of potential development, means that a third crossing should be the top priority and included in the NIC's strategic vision for large-scale transport improvements in London.

The linking of HS1 and HS2

KCC has specifically raised the importance of a dedicated link between HS1 and HS2 through joint meetings with the London Boroughs of Hackney and Newham and other stakeholders who are equally determined to see the installation of what many regard to be a missing link in the eventual High Speed (HS) network. Originally the draft hybrid bill for HS2, phase 1 (London - Birmingham) included such a dedicated link, which would have left HS1 just to the north of St Pancras and joined HS2 to the north of Euston. However, to reduce the estimated costs of HS2 and to speed the bill's progress through Parliament, the link was removed from the hybrid bill.

The current draft legislation will therefore result in a gap, of no more than about two or three miles, between the London termini of both HS rail routes. The strategic opportunity of operating through domestic, and eventually international, services between locations north of London, Kent and continental Europe will have been missed.

KCC regards this missing link as an essential piece of London's transport infrastructure, and urges the NIC to consider the options for funding and Parliamentary support required for its delivery. We have seen in Kent the transformational effects of HS1: wider opportunities for travel to employment, leisure, business and higher education. It would be a missed opportunity for London's transport network if this short distance between HS routes were not bridged by a dedicated link. It would not need to be at the full high speed of either HS1 or HS2, but it must be included in any future list of key infrastructure transport projects in the capital.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Crossrail 1 extension from Abbey Wood to Ebbsfleet and Gravesend

It is in the context of both the approved route of Crossrail 1 to Abbey Wood, and its putative extension eastwards, that KCC would support in principle the proposal for the Crossrail 2 scheme. The interchange between both Crossrail routes at Tottenham Court Road would be a key interchange in Central London, and would offer a wide range of journeys by rail with just one change for Kent passengers.

The principal large-scale rail transport infrastructure improvement that KCC would support would be the eastwards extension of Crossrail 1 from Abbey Wood to Ebbsfleet and Gravesend. An officer working group, led by the GLA and TfL, and including KCC and other interested authorities, is engaged in commissioning consultancy services to scope a Business Case into this proposal. KCC regards such an extension as essential in providing the necessary rail transport infrastructure to meet the planned growth in demand for rail transport between north-west Kent and London.

Crossrail 1 services will commence operation to Abbey Wood, which is located on the boundary between the London Boroughs of Bexley and Greenwich, in December 2018. The full Crossrail 1 route will be operational from December 2019, offering through services from Abbey Wood or Shenfield (Essex), via Liverpool Street and Paddington, to Heathrow or Reading. It will transform rail travel in and through the capital, and for Kent passengers will offer a single change at Farringdon from Thameslink services giving direct access to many West End destinations and Heathrow.

There has for been a long term aspiration held by, among others, the London Borough of Bexley for an eastwards extension of Crossrail 1. The line of route would follow the existing North Kent line from Abbey Wood, serving Belvedere, Erith, Slade Green, Dartford, Stone Crossing, Greenhithe and Swanscombe before serving Northfleet / Ebbsfleet International. It would then continue to, and terminate at, Gravesend, with turn-back and light maintenance facilities at Hoo Junction. This route has been safeguarded by all the affected planning authorities.

This project is crucial to London's transport infrastructure, as well as to that of north-west Kent and the Thames Gateway / Ebbsfleet area. It will, if approved, funded and delivered, provide a key rail transport corridor with frequent and reliable services direct to the West End and Heathrow, alleviating overcrowding and congestion on the exiting Mainline and Metro services which currently serve this and adjacent routes. It will also be imperative in providing the additional capacity required by the emerging Ebbsfleet Garden City through the Ebbsfleet UDC and, if it is approved, the proposed Paramount Leisure Park on the Swanscombe peninsula.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

In the United Kingdom, the example of Transport for the North (TfN), centred on but not exclusive to Greater Manchester, has established a template for the creation of further integrated transport authorities in other metropolitan areas. It is probable that the lessons learned in the creation and functioning of TfL, formed out of the former London Regional Transport and other transport authorities, would provide lessons and opportunities for TfN and other future transport authorities. The important point will be the opportunity for each metropolitan area to develop its own transport authority in a bespoke way that is appropriate for its location rather than to have a standard model applied throughout England.

As the largest non-metropolitan authority in England, KCC does not aspire to become its own transport authority. KCC regards the present arrangements, with significant influential input at all levels of Government, transport providers and operators by its members and officers, as the most effective way of procuring transport infrastructure in our county.

Finally, the proposed Strategic Transport Boards which are to be included in the new devolution deals will provide an opportunity for KCC to benefit from the increased level of devolved decision-making offered by Government. Following the success of the devolved funding granted through the LEPs, the new Strategic Transport Boards should enable local transport authorities such as KCC to adopt a more strategic approach to transport infrastructure investment throughout the county.

Conclusion

The provision of adequate transport infrastructure in London is key to the free movement of people, goods and services between London and the Home Counties, especially Kent. The areas highlighted above are the principal transport projects in which KCC is currently involved which have a direct bearing on this movement. KCC has also recently published its 'Growth and Infrastructure Framework' which includes estimates of future growth in employment and housing by district (including Medway). These statistics clearly demonstrate significant increases in both, especially in areas such as Ebbsfleet closest to Greater London.

The transport infrastructure for London and the greater south-east region clearly needs continued investment to ensure it is fit for purpose, for those living and working in the capital and for the ever greater numbers of people who will need to travel to London from Kent. KCC regards the work of the NIC as critical in ensuring the delivery of the transport infrastructure required to support the projected growth in employment and housing, in Kent and throughout the south-east.

LONDON ASSEMBLY

Transport Committee | Regeneration Committee

London Assembly
City Hall
The Queen's Walk
London SE1 2AA

Lord Adonis
Chair
National Infrastructure Commission
1 Horse Guards Road
London
SW1A 2HQ

14 January 2016

Dear Lord Adonis,

Submission from London Assembly

We are writing to set out the views of the London Assembly Transport Committee and Regeneration Committee in response to the National Infrastructure Commission's call for evidence. We welcome this consultation on the major infrastructure challenges facing the UK, and hope it will lead to the Commission making a strong case for renewed investment in enhancing the transport network in London. Assembly Members look forward to discussing these issues with you further at the Transport Committee meeting on 10 February 2016.

This submission is based on the key findings of recent Transport Committee work on London's transport infrastructure in a range of areas, and the Regeneration Committee's investigation into transport-led regeneration schemes. It focuses on the delivery of Crossrail 2, upgrading and extending the London Underground, enhancing capacity on London's National Rail services, and the potential need for investment to support additional airport capacity in the South East.

The need to upgrade transport infrastructure in and around London is pressing, with the capital's population set to grow to over 10 million by 2036.¹ Huge numbers of new homes, at least 42,000 per year, must be built to address a severe housing shortage and accommodate London's growth.² As the Regeneration Committee found in its recent report, new transport infrastructure is often vital to unlocking the development of new homes and jobs.³ We are seeing this at the Barking Riverside development in east London, where the extension of the London Overground network underpins plans for around 10,800 new homes in the area.

The capital's transport network is already almost at capacity, and while Crossrail will add new capacity, London's growth means that this is likely to be fully utilised shortly after the line's opening. Meeting these needs will be challenging for Transport for London in the light of the recent Spending Review, which has put pressure on TfL's investment budget and did not include

¹ <https://files.datapress.com/london/dataset/2014-round-population-projections/update-03-2015-2014rnd-trend-proj-results.pdf>

² https://www.london.gov.uk/sites/default/files/gla_migrate_files_destination/London-Assembly-response-to-Draft-Housing-Strategy-FEB14.pdf

³ <http://www.london.gov.uk/about-us/london-assembly/london-assembly-publications/transport-led-regeneration>

any major commitment to investing in London's transport infrastructure.

Crossrail 2

The Commission is rightly focusing on Crossrail 2, a proposed scheme that has the potential to significantly increase capacity and connectivity across London and the wider South East region. The Government has previously indicated support for this scheme, although no further funding was promised in the recent Spending Review beyond the prospect of an application to the new Transport Development Fund. At the Regeneration Committee's recent briefing, Members heard that Crossrail 2 requires £250 million of development funding to ensure that the railway can be delivered by the early 2030s.

Crossrail 2 would provide sizeable economic benefits, supporting up to 200,000 new jobs, and regenerating parts of north east London that have relatively high levels of deprivation. In addition to helping meet London's housing and job needs, the timetable and phasing for Crossrail 2 is crucial so that it can alleviate crowding at Euston following the construction of HS2.

In order to provide the best value for money and take advantage of the skills and expertise developed during the Crossrail programme in London, we would recommend approving Crossrail 2 and commencing construction as quickly as possible. There are a range of potential funding sources for the scheme as a whole; TfL has suggested that, with fiscal devolution, around 50 per cent of the required funding could come from local sources.

London Underground

Of equal importance to London is the upgrade of the existing London Underground network. The tube is Britain's busiest railway and is becoming busier than ever, with records for passenger numbers repeatedly broken in recent weeks. Without a significant and sustained increase in tube capacity, the city risks grinding to a halt.

The ongoing Sub-Surface Upgrade Programme on the District, Circle, Metropolitan and Hammersmith & City lines is projected to increase overall capacity by 40 per cent on these lines by 2023. The New Tube for London programme on the Piccadilly, Bakerloo, Central and Waterloo & City lines will deliver between 25 and 60 per cent capacity increases by 2033. It is vital that TfL receives sufficient long-term funding to complete these programmes, which has not so far been confirmed.

In addition to the upgrade schemes, line extensions can also boost connectivity in and around London. In particular, we consider that the proposed extension of the Bakerloo line is a vital project for south east London. It will complement the regeneration of this area, boosting connectivity in Southwark and Lewisham in particular. It should be supported by the Commission.

National Rail

The Transport Committee has engaged with Network Rail on plans for upgrades to London's rail network in Control Period 6 (2019-2024). There are a number of key priorities for London, including releasing additional track capacity around East Croydon station, extending Crossrail to Heathrow Airport's Terminal 5, and four-tracking the Liverpool Street-Stansted route. We were pleased to see some of these projects being supported by Network Rail, although the subsequent reviews of the organisation and the delays to Control Period 5 projects have cast doubt over their future delivery. Network Rail's investment plans should be clarified as soon as possible.

The biggest challenge facing London's National Rail network is the need to move toward metro-style service provision in south London. There is a significant disparity in the city between parts able to access a high-frequency, high-capacity tube network (generally north of the River Thames), and others relying on National Rail services with much lower standards (mainly to the south). This is a constraint on economic growth and causes misery for many passengers using overcrowded, unreliable services. It is clear that this problem has not been given sufficient priority in recent years.

The Transport Committee has recently undertaken an investigation into the potential devolution of National Rail services to the Mayor and Transport for London. Devolution that has so far taken place – notably, the transformation of the Silverlink franchise into the London Overground network – has proven to be a great success. TfL has invested substantially in the network, improving reliability, capacity, service frequency and accessibility. As a large organisation with a diverse revenue base, TfL is much more able to manage the risks of this type of investment than private franchisees. We advocate further devolution, beginning with suburban routes of the South Eastern franchise in 2018, a move supported both by rail passengers both in London and Kent.⁴

Orbital rail

A more general, long-term priority for London's transport infrastructure should be the development of orbital links, whether light or heavy rail. This would support the growth of other economic centres outside the Central Activities Zone, by creating employment opportunities in areas such as Croydon. The Transport Committee also found in a recent investigation into National Rail services, that Kent-based commuters would benefit from better connections to east London, to avoid interchange in central London, which would have the additional benefit of reducing crowding for London-based passengers.⁵

Airport expansion

Finally, we would like to address the issue of surface transport access to airports serving London. We understand that the National Infrastructure Commission is not seeking views on whether or where additional runway capacity should be provided in the South East, and our comments do not indicate support for expansion. However, we believe it is vital the Commission recognises that the surface transport implications of whatever decision the Government makes – should it decide to proceed with airport expansion – are huge.

As the Transport Committee set out in a submission to the Government, the Committee is deeply concerned that the Airports Commission's final report did not set out realistic plans for how much additional transport capacity would be required to serve an expanded Heathrow Airport, or a meaningful estimate of the costs of upgrading infrastructure, if a third runway is approved.⁶ Before any final decision is made the Commission should undertake analysis to make a more informed recommendation to the Government about the surface transport implications of expansion at both Heathrow and Gatwick Airport.

Dear Andrew Adonis

National UK Infrastructure Commission call for evidence - London's transport infrastructure

Thank you for giving the London Borough of Barking and Dagenham the opportunity to provide our views on London's long term infrastructure needs. Barking and Dagenham is London's Growth Opportunity with the potential for 35,000 new homes and 10,000 new jobs over the next fifteen years but this is only possible with significant investment in transport infrastructure. Therefore please find at Appendix 1 the Council's response to the questions set by the Commission which we would be delighted to discuss further.

Yours sincerely

Appendix 1

National UK Infrastructure Commission call for evidence - London's transport infrastructure

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

- 1.1 London's population is forecast to increase to over 10 million people by 2030. Within this Barking and Dagenham's population is forecast to grow by 30% and is only second to Tower Hamlets in terms of population growth. It also has the country's youngest population. Barking and Dagenham is London's Growth Opportunity with the potential for 35,000 new homes and 10,000 new jobs by 2030. It is at the epicentre of the Royal Docks, Upper and Lower Lea Valley, London Riverside and Thames Gateway Growth Areas. The Council is committed to growth, to playing its role in London and delivering for its community. It has ambition and aspiration to become a destination of choice, where people stay and feel welcome.
- 1.2 The major economic and social challenges facing London over the next two to three decades are meeting housing need, access to jobs, health inequalities and ensuring people have the right skills to compete for tomorrow's jobs. As evidenced by the Marmot Review "Fair Society, Healthy Lives" these issues are interlinked.
- 1.3 Nowhere in London are these issues collectively more pronounced than in Barking and Dagenham. At the same time nowhere in London is there the scale of opportunity to address these challenges provided the right investment in transport and social infrastructure is secured.
- 1.4 The major issues for Barking and Dagenham are:
 - Ensuring 35,000 are delivered and that these are real homes for real people i.e. homes that people working in London can afford and chose to live in.
 - Ensuring that transport connections enable these people to access jobs in growth areas of Central London, Royal Docks and the Lower and Upper Lea Valleys.
 - Ensuring that new communities have the prerequisite social infrastructure and are designed to enable people to lead healthy lifestyles and access high quality lifelong learning opportunities to give them the skills and confidence to compete for London's jobs.
 - To deliver growth in a way which empowers people to do more for themselves whilst strengthening the institutions which support local communities. This includes ensuring the proceeds of growth are maximised to sustain vital local services.

- 1.5 If these issues are not addressed London's economy will suffer as businesses will not be able to attract employees as they will be priced out of the capital due to the double whammy of not being able to afford to either live in London or afford to commute into London from cheaper areas.
 - 1.6 There exists an opportunity to prove that London can still be a place where people on low to medium incomes can afford to live and chose to live; a city which still functions as a place; a smart place which embraces technology and real time data to enable people to live healthy and sustainable lives and to access lifetime learning opportunities; a place where development is designed to meet the needs of people of all ages, which foster social interaction, and where walking and cycling are the default options for short journeys. That place is Barking and Dagenham.
-

What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground including, but not limited to Crossrail 2?

How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

What might their potential impact be on employment, productivity and housing supply in London and the south east?

- 1.7 Improved transport infrastructure is vital to London's future global competitiveness.
- 1.8 The Council is concerned that the traditional cost benefit ratio using the WebTag business case methodology fails to capture the economic benefits of the development that new transport infrastructure can unlock. For this reason the Council considers that the Gross Value Added generated by new homes and jobs must also be taken into account.
- 1.9 The Council is also concerned that the focus on funding sources such as Community Infrastructure Levy and Tax Increment Funding can work against low value areas such as Barking and Dagenham. This results in transport investment being focused in high value areas where the proceeds of development are higher and where transport schemes rely less on Government funding. However this accelerates the delivery of unaffordable homes out of the reach of normal Londoners and frustrates the delivery of real homes for London's workers in affordable places like Barking and Dagenham. These are homes for workers on low and medium incomes who are vital for the functioning of London's economy. To address this, the Council as part of the

North East London Strategic Alliance, has been making the case for the devolution of stamp duty receipts to help fund strategic transport schemes and this should be considered in the Commission's review.

- 1.10 Therefore investment in large-scale transport infrastructure improvements should be prioritised taking into account not only how much growth they will unlock but what sort of growth, who ultimately will benefit from the investment? Investment in Barking and Dagenham will benefit Londoners as it will unlock the delivery of homes within reach of the average London worker enabling them to live near to where they work. Unlike higher value areas the investment is also more critical as other sources of funding are less readily available.
- 1.11 There are four large scale strategic transport improvements in London which Barking and Dagenham consider are crucial to the success of London's economy as they will unlock the 30,000 new homes planned in London Riverside and connect them to the 215,000 new jobs planned in Canary Wharf, Royal Docks and Upper and Lower Lea Valleys. These improvements will allow people living in these new homes to enjoy relatively short journeys to work thus addressing a major factor in London's poor productivity. They will also alleviate pressure on already overcrowded transport infrastructure which is harming London's economic competitiveness.

 - London Overground Extension from Barking Riverside to Abbey Wood

Crossrail 2 eastern spur

- 1.12 There is a strong case for a Crossrail 2 eastern spur which clearly delivers significantly greater regeneration benefits than an extension to New Southgate.
- **Regeneration potential of London Riverside and wider Thames Gateway area** – Over 30,000 new homes and 10,000 new jobs are forecast to be delivered within London Riverside by 2030. This growth will inevitably lead to further pressure on already overcrowded rail services. Crossrail 2 would have a transformative affect on Barking Town Centre connecting Stratford which is East London's largest growth centre and the Thames Gateway which is the region's largest growth corridor. It is clearly an anomaly that as it stands neither London Riverside or Thames Gateway Essex is due to be served by Crossrail.
 - **Supporting population and employment growth** – In TfL's own sensitivity testing of route options for population and employment growth, it

was suggested that a Crossrail 2 eastern branch option could generate 52% of all population growth and 79% of all jobs growth in the Greater London Authority (GLA) area between 2031 and 2041 (equating to some 100,000+ extra people and 85,000+ additional jobs in that period). Whilst the borough's proposals for a Barking Town Centre Housing Growth Zone would deliver 5000 new homes over the next ten years ultimately Crossrail 2 could provide a catalyst for double this in the longer term. Moreover beyond the sites currently indentified in the London Riverside Opportunity Area Planning Framework, Crossrail 2 could reshape the industrial areas along the line by raising land values and transforming the prospects for new jobs and homes in areas currently undervalued and underutilised. These areas include Rippleside and parts of the Ford estate. The economic case for an eastern spur to Crossrail 2 is therefore extremely strong.

- **Benefits for passengers and train operations** – After Stratford, Barking is the best connected town centre in East London so it makes sense for it to be served by Crossrail 2. An eastern spur would transform Barking by providing an interchange between rail services from London Riverside and the Thames Gateway Essex growth areas. An eastern spur would provide, for people travelling from London Riverside and the Thames Gateway Essex growth areas, an interchange between Crossrail 1 and 2 services at Stratford a link to High Speed 1 and 2 at Euston St Pancras and interchange onto London Overground and London Underground services at Barking. Network Rail's long term demand projections indicate an increase in peak hour passenger demand in the range of 24% - 46% on services into London Fenchurch Street station to 2043.

1.13 The London Boroughs of Hackney, Newham and Havering and Essex County Council, have recently commissioned a joint study to explore the feasibility of an eastern Crossrail alignment and to present an outline business case for its development. It is the intention that the study, due to be completed by the end of February 2016, will provide a sound basis for further discussions with the Mayor of London, TfL and other relevant stakeholders.

Riverside Tunnel and Castle Green development opportunity

Background

- 1.14 The Roads Task Force Commission (RTF) was set up by the Mayor of London in 2012 to tackle the challenges facing London's streets and roads. This independent body brought together a wide range of interests and expertise, united in the belief that the Capital needs a long-term strategy for roads and a commitment to major investment in street management and urban design. The RTF report, published in July 2013, sets out a vision of how London can cope with major population growth and remain one of the most vibrant, accessible and attractive world cities.
- 1.15 Based on experiences of other major cities across the world it recommended undergrounding roads to reduce traffic congestion and attendant impacts and enable regeneration. In response the Mayor and TfL considered more than 70 locations across the capital for tunnels, flyunders and decking. In February 2015 the Mayor identified the A13 tunnel, between Lodge Avenue and Gale Street, as one of the top 5 locations for further feasibility. In developing business cases for these five tunnels the A13 was identified as most feasible and is now TfL's preferred scheme. TfL see this as a demonstration project with potential for application across London. It is untenable not to deal with the problems of air quality, severance and blight and inefficient land use that surface trunk roads cause across London.

Benefits

- The Riverside Tunnel unlocks land for over 5000 new homes and 1000 jobs on a development site known as Castle Green. These are additional homes to those identified in the London Plan and therefore help bridge the capacity gap the Mayor needs to cover between housing need and supply.
- This is the most prominent site in Barking and Dagenham, 100,000 vehicles pass it each day as well as thousands of commuters on the trains into and out of London. They form their image of the borough and East London from this site. The tunnel unlocks redevelopment enabling old, tired and eyesore industrial buildings to be replaced with modern visually stimulating development providing a fitting gateway to the 16,000 new homes planned at Barking Riverside, Thames Road and Creekmouth, 5000 at Barking Town Centre and 3500 at Beam Park and Ford Stamping Plant, enhancing values and increasing viability of development in these locations.
- The A13 is one of the 5 most polluted roads in London and breaches EU limits. The tunnel would be fitted with filtration system to remove pollutants significantly enhancing air quality for communities either side.

- The Riverside Tunnel overcomes the severance caused by the A13 which is a monumental psychological and physical barrier separating communities north and south and enables public transport to run between them.
- It improves journey times by removing the Renwick Road lights and Lodge Avenue flyover bottlenecks and improves resilience as the Lodge Avenue flyover is an accident hotspot and common location for breakdowns

Business case

- By 2036, more than 40% of East London's housing and 60% of jobs growth are due to be delivered within 2 miles of the A13 and the DP World port and logistics park continues to grow.
 - The Tunnel will cost £700m to construct and £260m to acquire land at today's prices. There is the potential for Community Infrastructure Levy, New Homes Bonus, road user charging and land value uplift to cover a significant proportion of the tunnel cost. This proportion could increase if stamp duty is devolved. The majority of the tunnel cost therefore is directly generated by the tunnel itself and would not be available otherwise.
 - Over the 60 year appraisal period using TfL's London Value of Time (VoT), the net present value (NPV) of the tunnel scheme is estimated at £617m due to journey time savings. These are highest for journeys of 20km plus which is why there is support from Essex MPs and it also has a positive impact for freight from Essex including London Gateway. The Riverside Tunnel generates a Gross Value Added of £791m due to the additional jobs and homes it unlocks.
 - In a 'with development' scenario, the scheme has a Benefit Cost Ratio of 1.85 representing "medium" value for money. However this doesn't account for the wider regeneration and strategic benefits that this development would unlock for London, which would include thousands of much needed homes.
 - This is not radical. It has been done in Oslo, Paris, Madrid, Boston and many other cities but it will be first of many in UK. TfL will use tunnelling expertise from major projects such as Crossrail and TfL is committed to CPO powers to assemble land at Castle Green.
-

Gallions Reach River Crossing and DLR extension to Barking Riverside London Overground Extension from Barking Riverside to Abbey Wood

- 1.16 Following the Mayor of London's decision in 2009 to abandon the Transport and Works Act for the Docklands Light Railway Extension from Beckton to Dagenham Dock the Council has worked hard with Transport for London to secure the future of the 10,800 homes at Barking Riverside by progressing the London Overground Extension as an alternative. This extension also provides passive provision for a station at Renwick Road to serve the 5000 new homes planned at Castle Green.
- 1.17 The Transport and Works Act (TWA) application for the London Overground Extension from Barking Station to Barking Riverside is due to be made in 2016 and the service is due to be operational in 2020. The S106 for Barking Riverside does not allow more than 1500 homes to be occupied until the TWA is authorised. Therefore the London Overground extension unlocks 9300 homes. However there exists capacity for a further 10,000 homes on former industrial land around Barking Riverside but this requires further transport improvements to unlock it. The Council considers that there remains a strong business case for extending the Docklands Light Railway across the River Roding to supplement the London Overground Extension and to deliver a further 10,000 homes.
- 1.18 Transport for London recognise this and as part of the current consultation on River Crossings have put forward a number of options for future extensions of the DLR including options across the River Roding to either Barking Riverside or Barking.
- 1.19 This would provide a convenient link to the 1000s of new jobs planned at the Royal Docks and the Crossrail Station at Custom House as well as potentially provide a link to growth areas south of the River and allow the London Riverside and Royal Docks Opportunity Areas to be planned and to function as one integrated growth zone.
- 1.20 The Mayor's Infrastructure Plan and his recent publication "Connecting the Capital" supports the proposal for a further extension of the London Overground line from Barking Riverside to Abbey Wood Crossrail Station. This is the missing link in the Mayor's aspiration to create a London orbital railway and would unlock the growth potential of the Thamesmead and Bexley Opportunity Area which has capacity for 21,500 homes and 8,500 jobs and also provide a convenient link from Barking and Barking Riverside to the Abbey Wood Crossrail Station.
- 1.21 Collectively the London Overground Extension with new stations at Renwick Road and Barking Riverside with an interchange at Abbey Wood and a DLR Extension to Barking Riverside and potentially Dagenham Dock would serve

50,000 new homes a similar number of homes to those planned in the Upper and Low Lea Valleys combined.

National Infrastructure Commission
1 Horse Guards Road
London
SW1A 2HQ

19th December 2015

Dear National Infrastructure Commission,

RESPONSE TO NATIONAL INFRASTRUCTURE COMMISSION CALL FOR EVIDENCE

Please accept this letter as London Borough of Brent's response to the National Infrastructure Commission's (NIC) call for evidence on the following three issues:

1. Improving connectivity between cities in the north of England
2. Large-scale transport infrastructure improvements in London
3. Improving how electricity demand and supply are balanced

Brent appreciates the opportunity to contribute towards the NIC's work and the Borough supports the process currently being undertaken by the Commission. The following response has been prepared based on the questions put forward by the NIC for each issue.

ISSUE 1: IMPROVING CONNECTIVITY BETWEEN CITIES IN THE NORTH OF ENGLAND

Brent has no comment on the issue of connectivity between cities in the north of England. We support Local Authorities in the north of England who wish to comment on this issue.

ISSUE 2: LARGE-SCALE TRANSPORT INFRASTRUCTURE IMPROVEMENTS IN LONDON

Q1: What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Brent is facing many of the same economic and social challenges as London and the United Kingdom as a whole. Sustained high population growth is a challenge across many policy areas, including housing, transport and employment. Brent's population is projected to grow by 24% to almost 390,000 over the period from 2012 to 2036 compared to 22.5% growth London-wide over the same period¹. This growth will place greater pressure on housing and services which are already straining to cope with record populations and usage, such as transport. In addition, it's a continuing challenge for the borough to support employment growth within the borough to provide jobs and economic stimulus for residents.

In recent years, the dynamic of these challenges has also changed, with greater focus on sustainable development. This trend is likely to continue in the future, with an increasing focus

¹ Office of National Statistics, 2015, *ONS 2012-based subnational population projections*, [Sourced from London Datastore] <http://data.london.gov.uk/dataset/ons-2012-based-subnational-population-projections/resource/dfdd7444-ea66-4a27-91ffa95fdc9fe611#>

on car-free development and localised employment and services, thus reducing the need to travel, along with the provision of sustainable transport options, such as walking and cycling in addition to public transport.

In order to deal with these challenges, significant investment is required in local transport infrastructure, including resolving existing maintenance requirements on local road networks. At the same time, investment is also required in large both new large-scale infrastructure (such as the Crossrail/West Coast Main Line link) and the modernisation of existing infrastructure (such as the Bakerloo line modernisation).

Q2: What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Brent believes that the greatest opportunity for investing in transport infrastructure in London is not in the strategic network, but in the local network. It is local transport networks which are currently suffering from deferred maintenance and lack of investment due to funding cuts, while additional funding is being made available for strategic transport networks, which, while important, do not carry the vast majority of vehicles (either passenger or freight) and can not support economic growth without a well maintained local network. At the same time, we recognise that funding must be provided to the strategic network as well. We do not see the demands of the different networks as an 'either-or' scenario, rather investment must be directed towards both networks to ensure the delivery of high quality national transport networks which support economic growth and improve peoples' wellbeing.

At a strategic level (both nationally strategic and regionally strategic), there are a number of major schemes which Brent supports:

West Coast Main Line / Crossrail link:

This project is Brent's highest priority transport project, on the condition that Crossrail trains call at Wembley Central Station. This project will support substantial regeneration in Wembley, along with providing high speed, high quality access for residents and businesses to Central London, Heathrow and the rest of the nation via the Old Oak Common Interchange.

Brent continues its work with Transport for London (TfL) on this issue and we would encourage Central Government and any other stakeholder to support it.

Upgrade and extension of the Bakerloo Line:

In addition to supporting growth in southeast London, the Bakerloo line currently has the oldest rollingstock on the London Underground network, dating to 1972. These trains are in considerable need of renewal, in addition to the need to modernise track and signalling along the route.

An upgrade of the Bakerloo Line, completed in conjunction with an extension in southeast London would improve access to public transport, reduce car usage and associated emissions and congestion across northwest London. The extension would support regeneration in Wembley, South Kilburn and Old Oak Common / Park Royal, improve journey times and provide better connections, improving public transport capacity and passenger satisfaction along the length of the Bakerloo Line.

High Speed 1 / High Speed 2 link:

While this project has been excluded from the HS2 Hybrid Bill, currently before parliament, Brent believes it is essential towards achieving a comprehensive national High Speed Rail network in the future. At the same time, the previous proposal via the North London Line in Camden, impeded the capacity of this route and would have had a detrimental impact on local communities.

An improved solution needs to be developed now, so that other projects do not jeopardise the practicality and deliverability of this link in the future.

Electrification of transport networks (road and rail):

Brent supports the electrification of transport networks (including both road and rail vehicles) for both freight and passenger services. While rail electrification works are planned with lengthy lead-in periods, the electric vehicle market is less certain, and as these vehicles become cheaper and more widely spread, there is a risk that domestic energy consumption could rise considerably for these vehicles. This could potentially require additional infrastructure to support these vehicles.

Increasing the uptake of electric vehicles in commercial fleets and household vehicles is predicated on having sufficient charging infrastructure to give people the confidence to switch to a hybrid or fully electric vehicle. Domestic infrastructure, coupled with nation-wide charging infrastructure is essential to ensuring that the nation's homes, offices businesses are prepared for zero-emission vehicles of the future.

Freight transport networks:

An essential requirement of any strategic infrastructure is the provision for freight to utilise the network. Pursuant to this, where possible, Brent strongly supports the relocation of freight from road haulage to rail, given the impacts on local amenity of poor air quality, traffic noise and safety risk of freight vehicles. We also support maintaining and/or improving access in the form of service slots and sidings for freight to rail networks, such as the West Coast Main Line, Dudding Hill Line and the Midland Main Line.

Cycling infrastructure:

While cycling infrastructure has generally not been considered to be strategic infrastructure, with the addition of high-capacity cycling infrastructure currently being constructed and/or planned across Greater London, along with the demand for greater cycling provision means the scale of infrastructure and popularity of cycling is increasing. The greater number of cyclists will generate additional demands on strategic road networks and for regional cycling infrastructure. These considerations should be taken into account both for strategic planning and in assessing individual traffic schemes.

Resolution of London's air capacity issue:

In February 2015, Brent Council wrote to the Davies Commission to recommend that of the three options being considered to increase London's air capacity, Brent's preferred option was the Heathrow Northwest Runway. The Davies Commission agreed with this and recommended the government move forward with this option. A final decision on how the government will proceed has been delayed several times. Ongoing uncertainty regarding whether an additional runway will be built at Heathrow or Gatwick Airports, or not at all affects the planning and transportation decisions being made by Brent, other Local Authorities and TfL. Resolution of this issue needs to be a priority in consideration of national infrastructure.

Q3: What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Brent understands that Transport for London has already undertaken considerable work to evaluate and increase the benefits of the proposed Crossrail 2 scheme. In spite of not being located on the route for Crossrail 2, Council officers have been kept abreast of the project's evolution as there are potential long-term impacts for the borough in relation to connections to Crossrail 1 (at Tottenham Court Road) and HS2 (at Euston), along with the interchange between these two projects at Old Oak Common.

Given that the opportunities for increased benefits will come with greater demands on local authorities along the route, Brent will reserve contribution on this question to those authorities.

Q4: What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Brent supports the funding arrangements for Crossrail 2, as currently outlined by TfL. We believe that it is fair and reasonable that large-scale, transformative infrastructure projects (including Crossrail 1 and Crossrail 2) should be funded by a combination of Central Government funding, Greater London Authority (GLA)/TfL funding, S106/Community Infrastructure Levy development contributions and localised business rates supplements for beneficiaries of the scheme.

A key consideration of equity which must be addressed for Crossrail 2 and future regional schemes such as this is the disparity of power for enforcing localised contributions between local authorities under the GLA and those located in the Home Counties. It certainly is achievable to come to negotiated settlements on funding agreements with these local authorities, however the Mayor of London does not have any authority to enforce them outside of the terms of the agreement. This will be of particular concern for Brent in support of the Crossrail / West Coast Main Line link, which will travel through the London Boroughs of Brent and Harrow, before continuing through Three Rivers District, Watford, and Dacorum Councils, which are all located outside of Greater London.

Q5: How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

No specific comments on this question.

ISSUE 3: IMPROVING HOW ELECTRICITY DEMAND AND SUPPLY ARE BALANCED

We have no specific recommendations for action on this issue, however we would note our concern regarding the challenge of ensuring continuity of electricity supply (across both the high voltage and low voltage networks) given projected population and employment growth, particularly in areas designated for regeneration, such as Old Oak/Park Royal. Of interest to the Council is how these services will be accommodated; particularly where they are proposed within the public highway and may affect transportation networks, other services or potential infrastructure improvements. In addition to this, Brent would be interested in opportunities for data to be shared, and upgrade works to be coordinated between utility providers so as to minimise disruption to residents and businesses.

I trust this response has been of some assistance, however if you have any questions, please feel free to contact our Transport Planner, Chris McCanna, on 020 9387 5424.

Thank you for your consideration.

Yours sincerely,

Tony Kennedy
Head of Transportation

London Borough of Camden's response to National Infrastructure Commission Call for Evidence – London's Transport Infrastructure

1. General comments

This response has been agreed by Camden's Cabinet Member for Regeneration, Transport and Planning.

Answers are given below to Questions 1-3 in the call for evidence. Further evidence is set out under 'References' at the end of this submission.

2. Question 1 - What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Camden has a very successful and diverse economy and it makes a significant contribution to the UK economy (with the 5th largest GDP of any local authority district in the UK) and is a key part of Central London's economy owing to its concentration of businesses, retail and tourism (Camden's GDP is the third largest of any London borough after the City of Westminster and City of London).

The borough is forecast to grow from 229,700 residents (in 2013) to over 265,000 by 2031 and the number of jobs to increase from 286,000 to 375,000 by 2031. This builds on historic rates of high growth recorded in Camden. Between 2004 and 2014 residents numbers grew by 13% while employment levels increased by 30%.

The level of development activity attests to the attractiveness and dynamism of Camden's local economy. In the decade 2005-15, 7,493 homes were built and 689 schemes involving employment floorspace were completed creating 453,742 sqm of office/industrial/warehousing floorspace and 59,000sqm of retail floorspace.

The London Plan housing target for Camden is about 8,900 additional homes from 2015-25 however London boroughs are advised to achieve and exceed this target in order to close the gap between London's needs and the supply of housing. LB Camden's emerging Local Plan aims to deliver a minimum of 16,800 homes from 2015-30 (including over 11,000 self-contained homes¹). A profound shortage in the number of affordable homes in London and the rapid growth in house prices and rents mean that more people are choosing to live outside the capital increasing the levels of commuting. A million people currently are commuting across Greater London's boundary every day into the capital. Without significant growth in the provision of affordable housing there is a risk that many businesses and the public sector will experience greater difficulty in attracting and retaining staff. Rising housing costs mean that residents are faced with spending an increasing proportion of their income on housing or living in cramped accommodation.

Camden's 'daytime population' already approximately doubles due to the influx of workers, let alone students and visitors travelling into the borough daily for a variety of purposes. Camden's night-time economy is also significant. In addition we have large numbers of people in transit throughout the borough. With population growth

¹ Self-containment is where all the rooms in a household's accommodation are behind a single door which only that household can use.

expected in the region of 2,300 people a year until 2031, the challenge is to ensure that this is supported by healthy and sustainable transport choices. Camden's screenline counts show that between 2006-2014, trips by car reduced by 13% - a trend which is expected to continue as the proportion of households without access to a car continues to increase (from about two-thirds currently). A sharp increase in cycle journeys has also been recorded. In 2006, cycling represented about 7.6% of Camden's traffic flow but in 2015 it was 13.6%. This is expected to continue to increase as a result of major investment in the cycling network in Camden and London.

3. Question 2 - What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?
- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

Crossrail 2

Transport for London consultation exercises have demonstrated that the 'regional option' of Crossrail 2 has greater support than the 'metro option' and is better suited to meet the needs of London's growing population and employment. It provides new connections across the London region directly into the heart of the capital and opens up significant regeneration opportunities, particularly by increasing the scope for new housing that London needs in areas such as the upper Lee Valley. Camden Council has recently provided a detailed response to the Crossrail 2 Growth Commission – call for evidence, which is attached to this submission.

In summary, the Council supports the principle of Crossrail 2 because of the benefits that it offers to Camden residents, businesses and institutions and to London as a whole. Through increasing capacity and connectivity, Crossrail 2 would support the conditions for continued economic growth, bringing vital jobs and business activity to the borough. By reducing congestion on current transport routes the scheme could mean faster and less crowded train and bus journeys for Camden's residents and visitors. Without Crossrail 2 the Underground platforms at Euston, already operating close to capacity, would not be able to cope with the additional demand generated by High Speed 2 leading to the intermittent closure of Euston Underground station when demand related to HS2 and National Rail services peaks. This would be similar to the intermittent closure of Oxford Circus Underground station currently experienced.

The current plans for the Crossrail 2 station at Euston show that around 130 homes and 17 businesses may be directly affected by its construction. These proposals have come about as a result of uncertainty over the redevelopment of the current Network Rail station at Euston which fails to realise the opportunity to incorporate the

renewal of the 'classic' Network Rail station as part of the proposed build programme.

A large proportion of this impact – and cost - is unnecessary and could be avoided by re-locating the proposed Crossrail 2 station entrance within the footprint of a redeveloped Euston station. A comprehensive redevelopment of the station integrating Crossrail 2, High Speed 2 and the 'classic' Network Rail station would deliver ongoing efficiencies and a better passenger experience at the interchange in perpetuity and mean the full opportunities for development and growth can be realised.

Euston Station comprehensive redevelopment

The most significant barrier to the delivery of additional growth at Euston is the risk of failing to integrate and co-ordinate the redevelopment of the existing Euston Station in conjunction with the proposals for the High Speed 2 and Crossrail 2 stations. By co-ordinating projects there are opportunities to share worksites, speed up delivery, reduce land take and create a comprehensive redevelopment above an integrated jointly delivered transport interchange between High Speed 2, commuter lines, the Underground, buses and Crossrail 2.

The Euston Area Plan (EAP) is the agreed opportunity area planning framework for Euston, jointly prepared and adopted by Camden Council, the Greater London Authority (GLA) and Transport for London (TfL) with HS2 and Network Rail providing technical support. It sets out the potential for transformational development and regeneration above and around the station with the potential to deliver 2,800-3,800 new homes (including the delivery of much needed affordable homes) and 7,700-14,100 new jobs. This vision encompasses a high quality development around a world class transport interchange, resolving the issues around movement between rail, Underground, bus and taxi services and would reconnect communities to the north, south, east and west. Links between the station and the surrounding street network are poor and the linear bus street at the front of the station is a barrier to permeability and provides a poor environment. Investment in the public realm and facilities for cyclists would help provide a more legible and safe environment and support non-polluting and healthier means of travel.

The Euston Growth Strategy (prepared by Camden Council, the GLA, TfL and Network Rail) indicates that a comprehensive redevelopment could generate a development value of circa £3bn, an additional £1.1bn of GVA per annum and return approximately £1.3bn to the exchequer up to 2060.

The lack of funding for the redevelopment of the classic Network Rail station puts the delivery of the shared strategic vision and development parameters set out in the Euston Area Plan at risk. Without a comprehensive approach to the station the significant growth and regeneration potential at Euston will not be fully realised. The benefits of much increased permeability, connectivity and ease of movement will be compromised and this uncertainty mars the prospect of harnessing developer interest in a comprehensive approach. Failure to bring about the timely redevelopment of the Network Rail station would prolong the severity and duration of

impacts on the local community which are already set to experience 17 years of construction disruption from High Speed 2

The existing station is no longer considered to be fit for purpose and fails in many respects. It provides an extremely poor station environment with limited facilities for passengers and is regularly overcrowded. Accessibility to the station and connectivity across its site between the track, concourse and surrounding street network is far below the standard which would be expected of a nationally important rail terminus and interchange and moreover one that is likely to become the UK's largest transport hub. There is an opportunity to create a station that the country can be proud of.

Growth in passenger demand from the West Coast Mainline on its own supports the redevelopment of the Network Rail station. Increasing congestion within the station building will worsen the experience of passengers using the station still further and be detrimental to its role as a key 'gateway' to London. Despite its strategic importance to London's economy, there is a sense that Euston station has been left behind as other London termini (King's Cross and London Bridge) have benefitted from significant investment to increase capacity and improve the passenger environment.

High quality development is capable of being delivered above and around this station to make efficient use of this Central London location in a way which delivers clear benefits for Camden's residents and businesses. The Council has evidence which suggests that a level deck solution, where the tracks of the classic rail station are sunken alongside the High Speed 2 tracks, would maximise the benefits realised from a comprehensive scheme. It would facilitate additional and larger development plots within the station complex. The construction of a platform above the existing station is capable of accommodating significant levels of development without causing detrimental effects (e.g. on the designated viewing corridors).

Development at Euston is well placed to build on growing cluster of high tech and knowledge based industries and institutions in this part of Camden. Further expansion and growth of these knowledge industries is expected to occur over the next decade. This 'knowledge quarter' includes the British Library, University College London and University College Hospital. The construction of the Francis Crick Institute is nearing completion and organisations such as Google and the Alan Turing Institute for Big Data will be moving into this area. Euston station is also close to Camden Town and capable of supporting the growth and regeneration expected to occur there.

Camden Council asks that a recommendation is made by the National Infrastructure Commission to the Secretary of State for Transport and the Chancellor of the Exchequer to accelerate the process of bringing forward funding for the redevelopment of the Network Rail station so there is one integrated development of the station (i.e. NR and HS2) undertaken in the same timeframe, with Transport for London's plans for Crossrail 2 fully integrated into the scheme. We also suggest that Euston Station could form a case study for the Commission to consider in further detail.

Improve orbital routes and provide new rail connections

Since Transport for London took over responsibility for rail services on lines now comprising the Overground network ridership has increased markedly. The growth in ridership cannot be solely attributed to conventional elasticity factors such as increases in rail services levels and background growth factors associated with rising population and employment, but to other factors such as improved connections, marketing, information, wayfinding within stations, re-staffing of stations late at night and quality of rolling stock and improved performance (*London Overground Impact Study*, for Rail and Underground Panel, TfL, 16 November 2011).

The extension of the Gospel Oak Barking (GOB) line to Barking Riverside will also enable regeneration of this area and bring similar benefits as those set out above for Crossrail 2. Funding has been committed for the electrification of the GOB line and this is planned to be finished by 2017. The extension of the Northern line to Battersea will have similar benefits to the GOB extension.

The proposed 2 new Overground stations at Old Oak Common (at Old Oak Common Land and Hythe Road) will help transform this area into an important new transport hub, linking with High Speed 2 and Crossrail and the regeneration area there, although funding for these stations has not yet been fully identified.

In making improvements to orbital and other rail services in London particular consideration should be given to improvements that maximise the use of existing infrastructure (thereby giving good value for money), that involve new connections and as far as possible that can be made within existing rail lands so as to minimise objections and reduce costs. Examples include the West Coast Main Line to Crossrail link (which would extend Crossrail westwards making better use of the new Crossrail tunnels, and would facilitate the reorganisation of terminating rail services at Euston for the comprehensive development of that station as described above) and the four tracking of part of the West Anglian Main Line that recently became part of the Overground. These two examples are not yet fully funded and should be priorities for investment.

Major works at selected Underground stations

The growth of rail ridership on the Underground necessitates major works at certain Underground stations to increase capacity for passenger movements within these stations for a variety of purposes including improving operational safety and enabling enhancements to existing rail service levels. Examples of projects that are currently being investigated or seeking powers but are not yet fully funded include Holborn, Bank and Camden Town, and these should be priorities for investment.

The fully funded Northern line Extension to Battersea between the Charing Cross and Bank branches facilitates the separation of the Northern line; trains crossing one another to travel to different branches at Kennington and Camden Town reduces train frequencies so works at these stations ultimately enable greater capacity for the entire Northern line. Higher throughput of trains at Bank station on the Northern line threaten the operability of this station, hence the advance works being programmed for this station. The Northern line extension to Battersea includes the building of more cross-passenger tunnels at Kennington to facilitate interchange between the

branches of the line and it is imperative that funding is provided for this approach at Camden Town station for the same reason.

Step free access at rail stations

In recent years works that provide step free access from the street, through a station and onto platforms has been undertaken in numerous stations in London including Camden. This has opened up rail services to those with ambulant difficulties, bringing economic and social benefits. These benefits increase more than pro rata as additional stations are improved, widening the network of stations that can be used. This programme of improvements should be continued, with priority given to well-used stations and those stations that are important hubs within London's transport networks. For example, the Thameslink and Overground stations in West Hampstead are being made step free, so if the Underground station at this location were made step-free the benefits would be wider than those that would be attributed to this station alone - given the wider network that would accrue by passengers interchanging onto the other very nearby stations at this location.

Rail station improvements and relationships to the surrounding urban realm.

The provision of new rail lines or improvements to particular stations should not be looked at in isolation. The urban realm outside stations should also be improved to provide better interfaces with connecting modes and to land-use developments that will be encouraged by rail improvements. The integration of transport and land-use planning improves public transport ridership and regeneration potential creating a virtuous circle of change. For example, the Council has been working with partners to harness the benefits of the new Crossrail station at Tottenham Court Road through 'The West End Project'. This is intended to transform the public realm, improve movement through the area and boost business activity.

Improving cycling infrastructure

Currently Camden is making substantial additions and improvements to its cycling infrastructure. By the end of 2015, Camden has doubled the amount of segregated cycle lanes in the past two years and by the end of 2016 Camden plan to have over 10km of new and improved segregated cycle lanes in the borough linking many of the boroughs town centres to each other and to the West End and City. The rapid development of cycling facilities (whether segregated or not) is resulting in a marked growth in cycling – by 2% from 2014 to 2015 alone to bring the cycle market share to 13.6% borough-wide for daytime traffic flows. South of Euston Road cycling accounts for more than 23% of daytime traffic. This supports sustaining increased levels of investment in cycling infrastructure for all types of rider.

4. **Question 3 - What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?**

The comprehensive redevelopment of Euston Station would provide opportunities to reduce the cost of delivering the Euston-St Pancras Crossrail 2 station and increase the benefits of the proposed scheme. This would be unlocked through aligning the Crossrail 2 programme with the redevelopment of the classic Network Rail station at Euston, and a commitment to the funding of both projects. Uncertainty over the redevelopment of the current Network Rail station and lack of a comprehensive plan for Euston Station has resulted in the current proposals which would lead to the demolition of over 130 homes, 17 businesses and community facilities. The costs of acquiring this property and providing adequate compensation to landowners adds significant unnecessary cost to the project. The impact on residential property at Euston is greater than at any other proposed Crossrail 2 station.

Both the cost and impact on residents and businesses in the Euston Area could be significantly reduced by a comprehensive approach to the station encompassing High Speed 2, the redevelopment of the classic Network Rail classic station and any new Crossrail 2 station. This would allow for re-location of the proposed Crossrail 2 entrance to a site within Euston station, the opportunity to share worksites, speed up delivery and reduce land take. This would avoid the highly detrimental consequences of demolition in the area north of Grafton Way to allow for the construction of a new station entrance and box.

The Tottenham Court Road Crossrail 2 station is currently proposed to have a southern entrance in Shaftesbury Avenue and a northern entrance on Oxford Street at Rathbone Place – both wholly within Westminster. At this early stage of the project the details are under discussion, however the Council is seeking a northern exit on Tottenham Court Road itself as this would build on the regeneration benefits in this area which are starting to be realised through the West End Project and the increased capacity of the Northern and Central line ticket hall. Transport for London is aware of this possibility and is looking at options.

As part of its representation to Transport for London on Crossrail 2, the Council has highlighted the significant impacts on Camden residents living in close proximity to the proposed Rathbone Place entrance (in Westminster). It is likely that this entrance would become a major pedestrian trip generator and may not be the optimal location in terms of pedestrian wayfinding and connectivity to the wider area. For this reason and the potential adverse impacts of the construction works on Gresse Street residential property, we have asked TfL to fully investigate alternative sites.

CROSSRAIL 2 GROWTH COMMISSION: CALL FOR EVIDENCE

SUBMISSION BY LONDON BOROUGH OF CAMDEN

23.12.15

1. Introduction

If Crossrail 2 goes ahead, Camden will be the host borough to two Crossrail 2 stations at Euston St. Pancras and Tottenham Court Road. The London Borough of Camden therefore welcomes the opportunity to submit evidence to the Crossrail 2 Growth Commission. This submission covers:

- Overview of Camden's current position on Crossrail 2
- The need for a comprehensive approach at Euston encompassing HS2, Crossrail 2 and the Network Rail Stations
- The growth and regeneration benefits of the comprehensive approach
- Tottenham Court Road

Further detail can also be found in the London Borough of Camden's draft submission to TFL's current consultation on Crossrail 2.

2. Overview of Camden's position on Crossrail 2

Camden Council supports the principle of Crossrail 2 because of the benefits that it offers to Camden residents, businesses and institutions and to London as a whole. Through increasing capacity and connectivity, Crossrail 2 would support the conditions for continued economic growth, bringing vital jobs and business activity to the borough. By reducing congestion on current transport routes the scheme could mean faster and less crowded train and bus journeys for Camden's residents and visitors, and better access to employment opportunities. However, we are opposed to the current plans as written due to their impact on residents and businesses at Euston.

In total, the proposals would require the demolition of approximately 131 homes and 17 businesses. The impact on residential property at Euston is greater than at any other proposed Crossrail 2 station. A large proportion of this impact is unnecessary and could be avoided by re-locating the proposed Crossrail 2 station entrance to a site within Euston station. The demolition affecting the area north of Grafton Place, to allow for construction of a new station entrance and box and for some of the station tunnelling works, is a direct consequence of uncertainty over the redevelopment of the current Network Rail station as part of a comprehensive Euston Station Plan. This site contains 71 homes including 45 in the Council-owned Wellesley House. The resultant impact on residents and businesses is unacceptable and Camden Council cannot support the project in its current form.

However, in early December the Secretary of State for Transport provided a number of assurances to Camden linked to the HS2 Hybrid Bill proposals for Euston. These assurances, explored further below, provide an opportunity to revise the Crossrail 2 proposals and significantly reduce the impact on residents and businesses in the Euston area as well as to deliver a better transport solution. This can though only be unlocked by aligning the Cross Rail 2 programme with the redevelopment of the classic Network Rail station at Euston, and a commitment to funding of both projects.

3. The need for a comprehensive approach at Euston

The most significant barrier to delivery of additional growth at Euston is the risk of failing to comprehensively redevelop the existing Euston Station as an integral part of the delivery of the HS2 and Crossrail 2 stations. By coordinating projects there are opportunities to share worksites, speed up delivery, reduce land take and create a comprehensive redevelopment above an integrated jointly delivered transport interchange between HS2, commuter lines, the underground, buses and Crossrail 2.

LB Camden have been lobbying individually through the HS2 Select Committee process and through our Euston Strategic Board (a joint board with the Deputy Mayor of London, HS2, Network Rail and DfT) to secure funding to integrate the delivery of the projects, and in particular to secure funding to redevelop the existing station within a complementary timescale to the Crossrail 2 project.

LB Camden secured a number of assurances on this through the HS2 petitioning process, which include the setting up of a new Euston Station Strategic Redevelopment Board with members from LB Camden, GLA, TfL, Network Rail, DfT and HS2 which has a responsibility to integrate the delivery of the HS2 station, the redevelopment of Euston Station, Crossrail 2 and over site development and advises the Secretary of State for Transport. This is welcomed, but there is still currently no funding committed to redeveloping the existing Euston Station in the timescales required to prevent extra land take for Crossrail 2. As currently programmed a

preferred option for the design of a redeveloped classic station will not be known for a further two years which is out of sync with both the CR2 and the HS2 station design process.

LB Camden considers that the design of all the stations needs to be undertaken at the same time to enable the full potential growth and regeneration benefits and to deliver a world class station with high quality development above and around it. This provides the opportunity to integrate the Crossrail 2 station and remove the need for the demolition of as many homes and businesses. TfL have indicated that this could also be more effective in reducing passenger congestion on the Victoria Line and Northern Line, a key objective of the Euston Crossrail 2 station. Communities surrounding Euston are already set to endure 17 years of construction disruption arising from HS2. Integrated design of the Crossrail 2 works would provide the opportunity to co-ordinate works to minimise the severity and duration of construction impacts on already severely impacted local communities.

4. Growth and regeneration benefits of the comprehensive approach

The Euston Area Plan (EAP) is the opportunity area planning framework for Euston, jointly prepared and adopted by Camden Council, the GLA and TfL. It sets out the potential for transformational development and regeneration above and around the station and this envisages the delivery of between at least 2,800 and 3,800 new homes and 7,700 and 14,100 new jobs. The vision encompasses a high quality development with a world class transport interchange and reconnected communities to the north, south, east and west.

The Euston Growth Strategy, prepared by Camden Council, the GLA, TfL and Network Rail in close consultation with HS2, indicates that a comprehensive redevelopment of the station area alone could deliver up to 16,200 jobs and 2,200 homes which could in turn generate a development value of circa £3bn, an additional £1.1bn of GVA per annum and return approximately £1.3bn to the exchequer up to 2060.

The council has further evidence which suggests that a level deck solution for Euston station, where the tracks of the classic network rail station are sunken alongside the HS2 tracks, can provide even greater returns whilst significantly enhancing the regeneration potential in line with the objectives of the Euston Area Plan. This should be explored with the integration of the CR2 station at Euston.

The Euston Growth Strategy includes five recommendations:

- A commitment to comprehensive redevelopment at Euston

- Comprehensive master planning, design and engineering (including HS2, the classic station and Crossrail 2)
- Easing rail capacity to get Euston right
- Upfront funding for over-site development enabling works
- A local skills and employment strategy to get our people ready

The assurances provided to the Council by the secretary of state are a significant progression of the first two recommendations and further work with the partner organisations is currently ongoing to take this forward.

To allow for the design and reconstruction of the station while maximising operating flexibility, measures to ease capacity at Euston should be considered and implemented. The delivery of HS2 and Crossrail 2 are interlinked, as TfL predicts that onward passenger demand from HS2 (Phase 2) passengers arriving in Euston requires the delivery of Crossrail 2. Other measures, such as a link at Old Oak Common, from the West Coast Mainline to Crossrail 1 and other measures should also be considered.

Securing funding for a development deck and over-site development (OSD) enabling works across the whole station site, including any Crossrail elements will also be essential for achieving growth. So far funding is only in place for the OSD enabling works above the HS2 station.

Measures to ensure growth delivers real benefits for local people and businesses are essential to the success of any scheme. The growth strategy seeks the development of a local skills and employment strategy to get our people ready. As part of the HS2 assurances, the secretary of state has committed funding towards a construction skills and training centre at Euston, building on the model established at the King's Cross Construction Skills Centre. This will provide real opportunities for local people to access jobs in the construction industry. Given the scale of CR2 in Camden, we would ask that Crossrail 2 commit to funding and working with the Construction Skills Centre to support Londoners to access employment on these major infrastructure projects.

5. Tottenham Court Road

The Tottenham Court Road area is already undergoing substantial works, many of which are associated with Crossrail 1. The area is also located at the borough boundary between Camden and Westminster and is already densely developed and highly populated. The Council is concerned about the potential impacts on Camden residents living in close proximity to the site and the siting of the entrance at Rathbone Place, as raised in the Council's draft Crossrail 2 consultation response. There are also concerns about the impact of further

disruption on local businesses, which would need to be carefully managed and minimised. Any further opportunities for growth are likely to be more limited and dependent on the station option taken forward.

London Borough of Croydon Response to National Infrastructure Commission Call for Evidence

London's transport infrastructure

January 2016

Introduction

Thank you for the opportunity to provide evidence to the Commission on London's transport infrastructure needs.

Croydon is a member authority of the South London Partnership (SLP) and London Council's, both of which are responding to the Commission's current call for evidence. Transport for London (TfL) is the strategic transport body for the Capital, planning and managing London's, Underground / Overground, tram, bus and strategic road networks. TfL is undoubtedly (either itself or as part of a Greater London Authority (GLA) 'family' submission) providing evidence on London's transport needs.

Croydon's submission is not intended to repeat evidence provided by the above. Rather its purpose is to add emphasis and provide more detail on one element of transport infrastructure of key importance to Croydon and the wider region and one falling outside of TfL's direct remit, namely the Brighton Main Line (BML).

Major economic and social challenges facing London and its commuter hinterland

Within its evidence, the SLP highlighted the scale of transformation already underway, at Croydon's growth zone/Opportunity Area (focused on the Croydon Metropolitan Centre). Here, upwards of 23,500 new jobs and 8,300 new homes are to be delivered by 2031. The annual Gross Value Added equivalent of these jobs is estimated to be in order of £1.2 billion by 2031.

The SLP's evidence also highlights South London having the highest road-based mode share of any London sub-region, together with some of the slowest journey times. If the growth within Croydon and South London is to be sustainable then (as well as improvement to its strategic road connections), investment in infrastructure providing for alternatives to the car is critical.

Thirdly, the SLP's evidence highlights the scale of population growth forecast for South London with current projections at nearly 240,000 additional people by 2020 rising to over 400,000 by 2031 (equivalent to another Croydon). It contrasts this population growth with the predicted pattern of employment growth. The London Plan forecasts around 800,000 additional jobs but these are mainly located in . The GLA forecasts that South London is set to achieve only 40,000 additional jobs. The SLP emphasises the importance of creating more jobs locally in order to lessen the demands on already strained transport infrastructure.

In summary the major challenge facing London, Croydon and London's commuter hinterland is growth and maintaining or improving access whilst maintaining or improving environmental quality and quality of life.

Growth does not only pose challenges. It also offers opportunities. By providing thousands of new jobs, side by side with new homes and the range of service offered by the Croydon Opportunity Area, Croydon is providing for access with the minimum of travel.

Polycentric growth, such as that at the Croydon Opportunity Area, offers a wider range of benefits. Network Rail's London and South East Market Study

(<http://www.networkrail.co.uk/improvements/planning-policies-and-plans/long-term-planning-process/market-studies/london-and-south-east/>) predicts peak hour passenger demand on Thameslink and other fast services from Sussex (just some of the Sussex services to Central London on the BML via East Croydon) doubling between 2011 and 2043. This growth is largely predicted to arise from growing population outside of London accessing jobs in central London

Table 1 Peak hour passenger demand projections 2011 – 2043 taken from 'Long Term Planning Process: London and South East Market Study' Network Rail, October 2013

Route	Service group	2011 total	Forecast passengers in 2043	Increase 2011 to 2043
London Bridge	Thameslink & Sussex fast	15,200	27,900 – 31,400	91% – 115%
	Sussex stopping services	9,300	11,700 – 12,900	26% – 39%
Victoria	Sussex routes - fast services	12,100	14,700 – 16,200	22% – 34%
	Sussex routes - stopping services	12,900	16,500 – 18,600	27% – 44%

Network Rail's Sussex Route Study (www.networkrail.co.uk/long-term-planning-process/south-east-route-sussex-area-route-study/) highlights the busiest/most congested parts of the BML as the route from East Croydon to London Bridge and Victoria. By providing thousands of new jobs at the Croydon Opportunity Area, Croydon provides the opportunity for those living between Brighton and London to access jobs without riding on the most congested part of the BML. The growing job market in central Croydon also provides for increased 'counter commuting'. Those living in inner London are able to travel outwards to work in Croydon, greatly increasing the utilisation of the BML infrastructure. It also means that those currently traveling into the Croydon Opportunity Area by tram and bus etc. to interchange to rail for onward travel to work in central London, have the opportunity to work in Croydon and shorten their commute.

What are the strategic options for future investment in large scale transport infrastructure improvements in London

The BML is Croydon's rail spine. It is also Croydon's and London's connection to Gatwick and the wider Coast to Capital Local Enterprise Partnership zone. However, the BML is severely overcrowded, with passengers routinely standing from south of Haywards Heath in the peak. This can only be resolved through running more trains. Current passenger growth is running at least 4%

per annum. If no action is taken, crowding will increasingly extend further south, and occur across a longer part of the day, leading to more instances of passengers being physically unable to board trains.

The BML is also poorly performing, with Public Performance Measure (PPM) plateauing at around 90% for several years, before dropping off due to the London Bridge works. The core reason for the poor performance is the extensive operational interaction between the numerous different train service groups, due to the current complexity of configuration of the rail network. By means of comparison: routes from London Waterloo feature operationally simple grade separated junctions all the way out as far as Woking, whereas there are over a dozen major operational constraints in the Croydon area alone.

The current Thameslink works at London Bridge will provide more cross-London capacity, but this work does not address the key bottleneck on the BML which is in the Croydon area. Hence the full potential benefits of Thameslink are significantly constrained by capacity away from central London. Therefore, only a few additional trains will be possible from 2018 until such a time as this is addressed.

The Croydon bottleneck impacts on service performance across a wide area. From 2018 following completion of the Thameslink works, it will also impact on new routes north of London.

As well as quantifying the problem, Network Rail's Sussex Route Study also lays out the solution. Resolving the bottleneck in Croydon requires additional tracks and platforms in a relatively contained area at East Croydon and grade separation of the London Bridge and Victoria Lines just north at Windmill Bridge Junction. The benefits are very large in comparison with the geographical extent of the project.

In terms of interchanging passenger numbers, East Croydon Station is the fifth busiest in the country (behind Clapham Junction, Waterloo, Victoria, London Bridge) and busier than the recently rebuilt Birmingham New Street and Reading stations. It is also busier than Stratford (London), St. Pancras, King's Cross, Euston, Glasgow Central, Liverpool Street, Manchester Piccadilly and Leeds. In terms of total passenger entries, it is the 17th busiest station in the country. It is busier than the likes of Cannon Street, Edinburgh, Brighton, Gatwick Airport, Glasgow Queen Street, Reading, Marylebone and Liverpool Central stations (ORR Station Usage Estimates 2013/14). However, East Croydon station concourse is severely congested.

New development adjacent to East Croydon and across the Opportunity Area, mean that the station itself is now the "missing piece" in the wholesale transformation of the area. There is an opportunity for a major regenerative station rebuild scheme including railway improvements, housing, offices, retail and improved urban realm. The opportunity exists to upgrade the critical constraints on the BML. However doing this requires land outside the railway corridor in the rapidly developing central Croydon area. There is a major risk that the opportunity could be lost forever if not taken now.

The signalling equipment on the Brighton Main Line requires wholesale renewal in the early 2020s due to it reaching the end of its asset life. It will be far more efficient to upgrade the BML in combination with this signal renewal, rather than as a separate project.

Croydon and the wider SLP share a desire for a “London Overground” type transformation of train services in South London. This is not possible to achieve through management or operator changes. It requires the operationally critical infrastructure constraints in the Croydon area to be removed through a major infrastructure upgrade.

Conclusions

Growth presents both transport challenges and transport opportunities. Growth within the Croydon Opportunity Area means that many of those opportunities can be realised. However for the Croydon Opportunity Area to fully achieve its potential, and for growth in London and the Coast to Capital LEP zone to be sustainable, it is critical that the major bottlenecks on the BML be addressed. In order to ensure efficiency, it is vital that the investment take place at the same time as the planned signal renewal during the next Control Period. It is similarly the right time to complete the regeneration of East Croydon with a new 21st Century station at the same time additional track and platforms are being provided.

Date : 8th January 2016

Dear Andrew,

Thank you for providing Enfield Council the opportunity to respond to the National Infrastructure Commission Call for Evidence on large-scale transport infrastructure improvements in London. We welcome this opportunity to respond on Crossrail 2 and the Council's wider aspirations for local growth linked to the project.

The Council strongly supports Crossrail 2 and believes it will provide the catalyst for transformational change in the Upper Lee Valley, unlocking the potential for thousands of new homes and jobs.

The Council has responded to both the Mayor's consultation and the Crossrail 2 Growth Commission call for evidence. It is understood submissions will inform the identification of further feasibility work needed to ensure plans for local development and the route are aligned.

The Council's response to the consultation questions is set out in the attached submission. Should you require any further clarification as to the Council's response, please contact Joanne Woodward, Head of Strategic Planning and Design on the details above.

Yours sincerely,

Rob Leak
CHIEF EXECUTIVE

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

1.1 Population growth across London and the South East is a major challenge for the area. Enfield's population has grown rapidly in the past decade and presently stands at 324,574 people and 129,000 households making it the fourth most populous borough in London. Projections suggest that by 2032 the population could rise to over 400,000 and the number of households to 169,000 (ONS 2012). This means we need approximately 1,900 new homes per year along with new schools, commercial uses and improved infrastructure, including significant transport investment.

1.2 These pressures for housing growth are not restricted to London and the Council has already received a request from one of its adjoining planning authorities concerning the potential for Enfield to accommodate some of its housing growth thereby increasing the pressure to find a sustainable solution to the need for new housing. More requests are expected as neighbouring authorities review their housing needs and available land supply.

1.3 The scale of the challenge means that a range of sources of supply of suitable land will be needed, including the intensification of existing urban areas and the need to consider land not currently identified for housing growth. Significant improvements to the rail infrastructure offered by Crossrail 2 will help unlock this potential.

1.4 The Council is taking a proactive approach to managing change and delivering growth in the borough. Its flagship regeneration project at Meridian Water is a £2 billion scheme set to deliver up to 8,000+ homes, a range of neighbourhood facilities and over 3,000 new jobs. The Meridian Water project alone will generate a £2.5 billion growth in GDP. Rail investment to the value of £70m which is already in place is a vital component of the infrastructure which supports Meridian Water. Indeed, without this investment, the regeneration of this nature and on this scale could not be taken forward. The Council is keen to work with the Crossrail 2 Commission to explore further the potential for growth in the borough arising from Crossrail 2, which will trigger further increases in housing capacity and associated economic benefits utilising the same principles which underpin the Meridian Water masterplan.

1.5 The West Anglia Routes Strategy Strategic Case submission by the London Stansted Cambridge Consortium (LSCC) (June 2015) states that on current trends the population of the LSCC area as a whole is forecast to grow by well over half a million people in the next fifteen years and another 210,000 jobs are expected - all of this before arrival of Crossrail 2. With GVA growth projected to significantly outpace job growth, the area will be contributing greatly to productivity growth. The Upper Lee Valley Opportunity Area is already a major employment zone, and the London Plan (2015) expects it to accommodate an additional 15,000 jobs, with potential for more if infrastructure

is improved further. Its potential for housing is even greater with the new revised London Plan coming forward in 2016, anticipating a minimum of more than 20,000 new homes, and it could be much higher with Crossrail 2.

1.6 Areas like the Upper Lee Valley have the greatest potential to grow Central London's labour supply, further serving dense and productive employment there as well as supporting employment areas such as Stansted outside of London. The potential for growth in the Upper Lee Valley has previously been recognised in the Mayor's Upper Lee Valley Opportunity Area Planning Framework (OAPF) 2013 and London Plan (2015).

1.7 Research by Oxford Economics, *Investment and Regeneration in the Lea Valley Corridor – Assessing the potential economic impacts for London and the UK* (2012) estimated that the Upper Lee Valley had the potential to generate £3.5bn+ of GDP if enhancements to rail infrastructure to provide four tracking and 8tph are provided along the West Anglia Main Line. Transport improvements already underway will help support growth and regeneration in the short term, but in the longer term these benefits would be substantially greater with a Crossrail 2 service of at least 12tph.

1.8 Tackling the borough's unemployment rate (7% compared to 6.6% for London as a whole) is another important objective for regeneration in Enfield. Building new homes in the borough on the scale needed but which are not connected to employment through rail infrastructure would not deliver our objectives for creating employment; stimulating economic growth and providing social equality. Similarly, the new employment opportunities planned as part of the regeneration of the area will not impact on unemployment in existing communities if transport infrastructure does not connect new employment to existing homes and communities in Enfield and beyond.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- **How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

2.1 Given the higher frequency of public transport that the combination of rail enhancement projects will deliver, including Crossrail 2, the North East Enfield Corridor will become a prime location as part of wider connectivity networks in and out of London and the wider Upper Lea Valley and London-Stansted-Cambridge Corridor. Crossrail 2 will support significant numbers of jobs and housing along the line and provide general regional connectivity.

2.2 Enfield's plans for a new gateway station at Meridian Water (to replace Angel Road) mean that there will already be a modern, high quality station serving a major development site. In order to accommodate Crossrail 2, stations at Brimsdown, Enfield Lock and Ponders End will also all be upgraded. This will accommodate higher frequencies, with an additional 12 trains an hour being proposed. This increased capacity will unlock the long term potential of the areas served. The New Southgate area would also increase capacity with up to 15 trains per hour, vastly improving capacity and journey times.

2.3 The provision of a station at Alexandra Palace will also open up direct access to Crossrail 2 for the 13 million passengers (based on 2013/14 figures) in Haringey, Enfield and Hertfordshire who use the stations to the north. The interchange at this station will also relieve crowding at Finsbury Park station, which before wider Thameslink upgrades and development in the local area already has 28 million Underground users, 6 million national rail and a conservative estimate of 1 million interchanges per year. The station will also cover a wide area of north London and offer alternative travel opportunities to those using Piccadilly line services in Enfield, again reducing crowding on existing services and opening up development opportunities currently constrained by network capacity.

2.4 Given the higher frequency of public transport accessibility that the combination of rail enhancement projects will deliver, a number of new local town centres could be developed along the North East Enfield Corridor, focused around the new Crossrail 2 stations and serving both existing and new communities. Indicative masterplanning suggests that commercial and residential uses could be accommodated together creating lively and attractive environments.

2.5 These rail infrastructure improvements would have a significant impact on employment and productivity. Enfield is already one of London's most important business destinations, easily accessible to London's strategic road network and positioned within the London Stansted Cambridge Corridor (LSCC). The relative low cost and availability of commercial floor space and land has helped attract an enviable and diverse industrial base to the borough. Representing the second largest industrial location in the capital, the borough is home to almost 10,000 businesses providing nearly 100,000 jobs. Enfield's employment is expected to grow to 121,000 by 2036. The Council has aspirations to meet the needs of the growing population, working towards a target of 40,000 new jobs between 2010 and 2035, equating to approximately 5% of the forecast job growth for London as a whole.

2.6 Existing growth sectors include low carbon clean tech energy from waste, logistics, warehouse and distribution and professional, scientific and technical. The relative low cost and availability of commercial floor space and land has helped attract an enviable and diverse industrial base to the borough. Maximising employment opportunities for local residents and Londoners whilst accommodating housing growth will be a key challenge for the future and a key priority is to retain jobs and businesses in the borough and help them thrive.

2.7 Although UK and London industrial heritage is in decline as a result of changes to the UK's economic environment, there are a number of viable businesses being priced out of the more expensive areas of London. This creates an opportunity for the borough to promote its capacity to accommodate these businesses with their increased employment offer as part of a wider transformational change agenda.

2.8 Current assessments prepared by the Council's Meridian Water specialist advisors highlight Enfield's ability to provide better equipped and comparably cheaper B1 employment space within easy reach of Central London making it an attractive choice for expanding incubator, accelerator and co-working (IAC) companies. This is in contrast to inner London where there is an increasing lack of flexible and affordable workspace for expanding creative and knowledge-intensive companies.

2.9 Meridian Water is ideally located within the London-Stansted-Cambridge Corridor and can therefore capitalise on sectors associated with this region including life sciences and ICT. The Council has a clear and credible approach to identifying new employment uses which can meet the project aspirations of achieving 3,000 jobs in higher paid sectors. This will see a shift away from the traditional lower density industrial sectors located in the Upper Lee Valley. Meridian Water will bring in employment uses which are capable of paying a salary range from the London Living Wage to a minimum of £70,000.

2.10 The successful realisation of a shift towards higher quality business and residential uses in Meridian Water helps support the case for stopping rail

*NATIONAL INFRASTRUCTURE COMMISSION – CALL FOR EVIDENCE
SUBMISSION FROM ENFIELD COUNCIL 8TH JANUARY 2016*

services within the area by Crossrail 2. Such services would also form a strong catalyst for the realisation of higher value sectors employing an increasingly higher skilled workforce and benefitting from connections to Central London and the London-Stansted-Cambridge corridor and wider south east region.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

3.1 The Council is already working closely with Transport for London to consider the positive impacts Crossrail 2 might have on promoting housing, improving access to jobs and delivering sustainable places and meaningful regeneration. Utilising the 'Crossrail 2 Strategic Business Case' submission as a basis for future work, the Council suggests that alternative growth scenarios could be modelled to determine the optimum level of benefits from growth that Crossrail 2 could bring. This would benefit from further collaborative working in partnership with the GLA.

3.2 Imaginative use of land in Enfield across the South East, will unlock the potential of areas by maximising housing and employment growth and creating sustainable communities which support both economic and social objectives. However, the realisation of this potential is dependent on rail infrastructure. Crossrail 2 in Enfield could:

- Support the delivery of a significant number of new homes to meet a strong and increasing housing demand;
- Enable the transformation of predominantly low density employment areas into higher density mixed use communities;
- Provide a huge uplift in public transport accessibility, improve access to employment by reducing journey times to key destinations in the Central Area Zone and the LSCC and
- Enable four-tracking of the West Anglia Mainline to increase capacity.

Phased delivery

3.3 The benefits of phased delivery of Crossrail 2 can be realised by Government confirming funding for delivering solutions to level crossings and 4 tracking of the Lea Valley mainline at the earliest opportunity. This phased approach has a number of advantages:

- It demonstrates ongoing commitment, helping to build confidence amongst investors and the public;
- The funding profile is smoothed and therefore more manageable;
- Infrastructure provision is more closely matched with demand with less need for revenue support or excessive crowding; and
- Local skilled workers have ongoing opportunities for employment which avoids de-skilling and labour shortages.

Land use

3.4 There is a need to understand the constraints, opportunities and likely impacts associated with any redistribution of industrial floorspace through the

consolidation, intensification and densification of existing industrial estates in North East Enfield. It is also important to further test the cohabitation opportunities of commercial uses through exploring typologies for new industrial and mixed use employment space. Where market conditions are considered to be appropriate, the constraints, opportunities and likely impacts of alternative locations within the borough for some of the existing industrial floorspace could be also tested.

3.5 This work should include industrial sectoral analysis to review the potential for new sectors such as bio-tech, to form part of future demand for space around key stations in the North East Enfield Corridor. This will need to draw upon analysis sectors such as the life sciences sector for the London Stansted Cambridge Consortium; the Upper Lea Valley low carbon economy; property requirements and locations for the London knowledge economy; and employment land market.

Upper Lee Valley Branch – Eastern Enfield

3.6 At present on the West Anglia Main Line, local stopping services and faster services from Cambridge and Stansted Airport all compete for space on the same line. This limits the number of trains that can call at local stations and extends journey times to and from the area. Liverpool Street and Stratford stations also currently face severe capacity constraints. It is forecast that by 2043 demand for rail travel on this line will have increased by 39% - currently there is no spare capacity for additional services.

3.7 Crossrail 2 provides a solution; it would free up capacity on the West Anglia Main Line helping to reduce journey times for longer distance services and would enable more local services to central London. Transport improvements already underway will help offset the pressure in the short term. But Crossrail 2 is needed to cope with longer term growth.

3.8 Enfield's plans for a new gateway station at Meridian Water (to replace Angel Road) mean that there will already be a modern, high quality station with step free access serving a major development site. Alongside this it is positive that in order to accommodate Crossrail 2, the stations at Brimsdown, Enfield Lock and Ponders End will be upgraded to higher standards, including making them step free. Further discussions will be necessary to agree the details of the upgrades, as well as the possible re-configuration/relocation of some stations to improve passenger access.

3.9 The Council strongly supports increased frequencies at all of these stations, with the additional minimum 12 trains per hour service proposed in the consultation, being a level which will unlock the long term potential of the areas served. It would create capacity for two additional local stopping trains per hour to Stratford and much improved connections to Stansted Airport and Cambridge. Conservative estimates are for Crossrail 2 to unlock 70,000 homes

and 27,000 jobs along the Upper Lee Valley, including at our key regeneration site of Meridian Water together with the wider and longer term opportunities for additional growth in the North East Enfield Corridor.

3.10 It is recognised that level crossings will have to close at Enfield Lock and Brimsdown and alternative solutions assessed to mitigate impacts on east-west transport connectivity, road safety and rail network reliability. The Council, along with stakeholders from along the West Anglia rail route, strongly supports this happening before 2024. However this is on the proviso that mitigation is put in place which improves transport network connectivity, with a particular focus on accommodating bus services and people who choose to walk and cycle, while causing the least disruption to residents in the area around them.

New Southgate Proposals

3.11 The Council welcomes the benefits which Crossrail 2 could deliver in the New Southgate area. The New Southgate proposals will provide up to 15 trains per hour via Seven Sisters; vastly improving capacity and journey opportunities. However this is a drop from 20 trains per hour and the Council would welcome discussion on the rationale behind this. Previously it was the case that 20 trains per hour was the minimum required to make the New Southgate branch viable. Given recent experience, the Council would like to see an early commitment from Network Rail and Transport for London to minimum levels of service, so that these can be factored into our discussions with development partners.

3.12 New Southgate station provides local employment opportunities at the adjacent Crossrail 2 train stabling and maintenance facility, while reduced journey times - only 21 minutes to Victoria - bring 410,000 more jobs within a 45 minute journey. These opportunities will be accessed via step-free stations which have capacity for 2,000 more passengers per day in the morning peak hour.

3.13 Overall the New Southgate branch provides direct access to Crossrail 2 for a large area of north London and unlocks potential for significant regeneration and redevelopment.

Alexandra Palace

3.14 The provision of a station at Alexandra Palace will open up direct access to Crossrail 2 for the 13 million passengers (based on 2013/14 figures) in Haringey, Enfield and Hertfordshire who use stations to the north. By providing an interchange further to the north for suburban rail passengers, there will also be crowding reduction benefits on both the Piccadilly and Victoria Underground lines; one of the core objectives for Crossrail 2.

3.15 Alexandra Palace interchange will also relieve crowding at Finsbury Park station, which before wider Thameslink upgrades and development in the local

area already has 28 million Underground users, 6 million National Rail and a conservative estimate of 1 million interchanges per year.

3.16 The station at Alexandra Palace will also cover a wide area of north London and offer alternative travel opportunities for those using Piccadilly Line services at Bounds Green and Wood Green, which again reduces crowding on existing services and opens up development opportunities currently constrained by network capacity. The Council's support for the benefits of the Alexandra Palace route alignment and the potential for growth it could have outside of London is shared by local authorities along the route north of London – including Hertfordshire County Council, Stevenage, East Herts, Welwyn and Hatfield Councils. The Council would welcome further discussion led by the Crossrail 2 Commission to debate the route options.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

4.1 An independent report for Crossrail 2 produced by PricewaterhouseCooper (PwC) (2014) sets out options into how Crossrail 2 could be funded. It shows that over half of the costs of the scheme could be met by London using existing funding mechanisms. Enfield Council supports this and is prepared to play it's part.

4.2 The Council's vision is for phased investment in the transport network in the Upper Lee Valley, which has the following advantages:

- It demonstrates ongoing commitment, helping to build confidence amongst investors and the public;
- The funding profile is smoothed and therefore more manageable;
- Infrastructure provision is more closely matched with demand with less need for revenue support or excessive crowding; and
- Local skilled workers have ongoing opportunities for employment which avoids de-skilling and labour shortages.

4.3 The development at Meridian Water is expected to lever in significant investment into Enfield and unlock the financial potential of the area. The Council will work closely with its partners to support investment and job creation across a number of sectors in Meridian Water, particularly in the Meridian East area. Beyond the use of its planning powers, the Council is looking at opportunities to encourage investment in these areas, reducing regulatory and financial burdens wherever it can, bidding for joint funding wherever appropriate and leveraging in assistance from partner organisations and groups. In order to drive the local economy forward and create jobs for new and existing communities, Meridian Water presents an opportunity to expand on the existing area's assets. There is a significant opportunity to expand, upgrade, regenerate and/ or intensify existing facilities in the area.

4.4 Meridian Water is one of London's Housing Zones. The Housing Zone funding is already providing major station upgrades, including Funding for the upgrade of Meridian Water Station (formerly Angel Road); new road infrastructure and bridges.

*NATIONAL INFRASTRUCTURE COMMISSION – CALL FOR EVIDENCE
SUBMISSION FROM ENFIELD COUNCIL 8TH JANUARY 2016*

4.5 The Council is driving forward the development of Meridian Water through land purchase and pump priming transport infrastructure, including funding new bus routes. With additional funding streams in order to pump prime infrastructure on a larger scale, and in order to purchase land on the route in advance of development, the local authority would have the ability to capture the land uplift.

4.6 The Council is programming to have its planning framework in place by 2017/18, aligned with the programme for the Mayor's New London Plan and Upper Lee Valley Opportunity Area Planning Framework to capture growth generated through Crossrail 2 in order to exercise its Compulsory Purchase Order (CPO) Powers. Given the optimal timeline to seek parliamentary powers for permission to build and operate Crossrail 2 would be between 2017- 2020, the Council's land assembly strategy would need to commence in 2016 before certainty for Crossrail 2 project delivery is confirmed to assemble land at current use value.

4.7 The Council plans to carry out an early comprehensive assessment of current land values to inform the land assembly strategy, which will then be used to capture increases and recoup some of the uplift. Initial assembly would be through negotiated purchase but given the complex nature of land ownerships in the North East Enfield Corridor, the Council would need to exercise its CPO powers.

4.8 In the process of optimising land use we need to redesign infrastructure to ensure sustainable delivery on the scale required. This is likely to lead to profound changes which will impact on business rates during the period of change as some industrial estates are relocated and others come on stream. We will need a mechanism that can award a 'zonal status' on the areas affected to ensure that the loss of business rates does not impact the process. Transitional support to local authorities would need to be made available to ensure the success of transformation. Consideration also needs to be given to premium revenue streams being identified to offset the CR2 costs.

NATIONAL INFRASTRUCTURE COMMISSION CALL FOR EVIDENCE

RESPONSE FROM THE LONDON BOROUGH OF HACKNEY

1. WHAT ARE THE MAJOR ECONOMIC AND SOCIAL CHALLENGES FACING LONDON AND ITS COMMUTER HINTERLAND OVER THE NEXT TWO OR THREE DECADES?

London's population is rising rapidly, a predicted increase to 10 million people by the early 2030s is now being seen as a conservative estimate. Research by consultancy Atkins, in partnership with Oxford Economics and the Centre for London, claims London's population will actually become home to 12 million people by 2050, surpassing even the GLA estimate of 11.3 million. It also claims that there will be 6.3m workers by 2026 rather than 2050 as currently estimated.

London's overall employment growth is to a large part driven by its role as a leading world class city. The largest density of high value activities associated with this reputation are primarily located within inner London, an area defined as the Central Activities Zone of which Hackney forms a part. This area hosts over 30 per cent of London's jobs.

London's continued economic growth will, alongside demographic factors, drive an increase in population numbers. Current GLA forecasts show Hackney's population alone is predicted to increase by between 100-150,000 between 2011 and 2050.

Unless the supply of housing, new employment space and infrastructure is increased across the capital in line with population growth and the predictions of growth are used to anticipate both the investment and delivery of infrastructure, London's economy will falter.

While rail provides the main backbone of the transport system, London's buses tend to provide local links and with an affordable fare system. However, the streets are increasingly having to cater for higher volumes of pedestrians and cyclists and for servicing and freight logistic requirements as population densities increase.

To cope with the increase in population and economic activity London's current infrastructure must continue to expand to cater for additional demand. From utilities, particularly water and electricity, to Local Government and local public services such as Education, Health and Social Care provision. All will need to receive adequate revenue and capital investment from both public and private sources to keep pace with demand and maintain London's competitiveness.

2 WHAT ARE THE STRATEGIC OPTIONS FOR FUTURE INVESTMENT IN LARGE-SCALE TRANSPORT INFRASTRUCTURE IMPROVEMENTS IN LONDON – ON ROAD, RAIL, AND UNDERGROUND – INCLUDING, BUT NOT LIMITED TO CROSSRAIL 2?

- **How should they be prioritised, taking account of their response to London’s strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential be on employment, productivity and housing supply in London and the SE?**

The Council would suggest that the infrastructure requirements needed are outlined in the Mayor of London’s Infrastructure Plan 2050 and subsequent updates. We would specifically refer to the following as relevant to Hackney:

CROSSRAIL 2

Crossrail 2 is needed to address capacity constraints that will exist on the London Overground and Underground. It will allow up to 270,000 more people to travel into central London during the weekday morning peak period. This scheme is seen as a priority.

The Case for an eastern alignment on the route

However, although Crossrail 2 will improve public transport connectivity to and from Dalston the Council considers that an additional eastern alignment would cater for further growth in Hackney Central and Hackney Wick before heading east to Essex via Newham and Barking & Dagenham.

When this option was first examined we note that the original projections from September 2012 indicated an increase in population of 101,000 and 85,000 additional jobs associated with it.

Significantly since those figures population growth projections for London have been revised upwards with population growths of 30% now forecast in Hackney and Barking alone by 2041 and 50% in Newham for the same period. Thus there will be an expectation of greater population growth along the route on the eastern branch in the order of 330,000 in those 3 Boroughs alone. On job increases these are forecast to rise by 150,000 in Tower Hamlets (mainly around Canara Wharf), 20,000 in Hackney and 70,000 in Newham, again by 2041. This points very much to the idea of the eastern branch having primarily a strong regeneration case and would greatly strengthen the need and business case for the railway.

The LLDC is on target to build 24,000 new homes by 2031 and is already delivering in excess of the London Plan housing target of 1,471 homes per annum. Enhanced connectivity has the potential to increase these figures considerably.

The proposed Crossrail 2 alignments to the northern route have also been promoted as they would relieve overcrowding on both the Victoria and Piccadilly lines. These lines have planned capacity increases of 9% and 60% respectively yet the Crowding Map for 2041 shows little overcrowding on the Piccadilly line north of Manor House.

Proposals for the routing of the eastern branch have indicated two potential alignments towards Stratford. One of these alignments suggests the possibility of an underground Crossrail 2 station at Hackney Wick. The Council commissioned consultants to prepare a report on the feasibility and business case for such a station. The report suggested that the amount of developable land within a 12 minute catchment could deliver associated regeneration benefits in the order of £1.4 billion, well in excess of the benefits necessary to justify a new station.

Accordingly, in any further work on the eastern branch Hackney would seek to have a station at Hackney Wick that would afford a level of relief on the already congested London Overground and also assist in relieving the crowding scenario forecast for 2041. A station in the Hackney Wick area would also unlock growth opportunities in the NW part of the LLDC area which has been identified in their Local Plan to 2031 as having the weakest public transport links.

A future station at Stratford

Currently Crossrail 2 are considering two potential alignments through the Stratford and Olympic Park area for the eastern branch. This consists of a southern alignment with a station at Fish Island and Stratford Regional and northern alignment with a station at Hackney Wick and north of the International Station at Stratford.

The International Quarter at Stratford will accommodate 25000 people. Here East, a new creative and digital hub is expanding to provide jobs in the media, creative and cultural industries. In addition the 2014 Employment Land Review estimates that employment growth in the LDDC area will provide an additional 44,700 to 47,000 jobs by 2031.

Both Hackney and Newham Councils consider the northern alignment to offer the best long term solution for the Queen Elizabeth Olympic Park, Hackney Wick, Stratford City, Stratford Regional Station and the High Speed Kent lines. This would provide a well served national and potentially international high speed, light and heavy rail interchange facility. This option is preferred as it would:

- Link up the International Station with the High Speed Kent services, the DLR and Overground providing relief to Stratford Regional Station and the southern entrance to Westfield Stratford as well as directly serve any forthcoming developments there such as the emerging Stratford City office quarter and the completion of the Olympic & Paralympic Legacy project.
- Relieve the 2041 crowding scenario identified at Stratford Regional on both the Central line and the new Crossrail 1 corridors and would make use of spare capacity on the Jubilee line to serve Canary Wharf.

In addition to locating a Crossrail 2 station north of the CTRL box, the development of a surface station at High Meads loop in close proximity to the International and DLR station would further enhance the hub arrangement. Such a station could allow Lea Valley Line services to utilise the loop at Stratford and provide additional platform capacity for Lea

Valley Line services and provide additional resilience for the Overground when congestion occurs.

Finally a further benefit of developing an additional interchange station at this location would result in higher PTAL levels and a corresponding increase in development values thus freeing areas currently inefficiently devoted to parking.

In order to promote the case for an eastern alignment we have collaborated with the London Boroughs of Newham and Barking & Dagenham, together with Essex County Council to commission a study into a possible eastern option.

Barking & Dagenham have ambitious plans already underway, to position Barking as a place to accelerate the areas growth potential and encouraging inward investment to build new homes and create new jobs. A number of key sites have been identified in and around Barking town centre which have the potential to unlock further growth together with developments further east at Beam Park in close proximity to the C2C line. A direct rail link between Barking town centre and the Stratford rail hub, which an eastern route for Crossrail 2 could provide, is a key infrastructure requirement.

The Study is expected to report in mid-February, and we would be happy to share any recommendations and conclusions from the study.

Continue to improve the London Overground Network

The expansion of the London Overground Network has been a success story with large increases in passenger numbers being accommodated with longer trains. More frequency increases and improvements are planned and the transfer of services to TfL has witnessed a transformation in the quality of the service as well as improvements to stations.

However, further growth in the coming decades will result in severe overcrowding on some sections of the E-W route between Stratford and Highbury & Islington, the line serves Dalston Kingsland, Hackney Central, Homerton and Hackney Wick.

London has seen the benefits of improved interchanges such as the one at Hackney Central/Hackney Downs which has already exceeded its first year target for patronage. The effect of this has, however, put pressure on the existing Hackney Central station which together with Dalston Kingsland, Homerton and Hackney Wick will need complete reconstruction to be able to cope with future increases in demand.

We note that TfL are about to submit plans to provide short term improvements to Hackney Central. Although these are welcome they are barely proposing to keep pace with existing demand let alone future demand.

On the N-S routes, recently taken over by TfL we note that the stations are characterised by poor or outdated infrastructure and we would also wish to see these brought up to standard alongside enhanced services.

Demand for rail travel in east London and north east London along the Lea Valley Corridor is expected to grow heavily in the next decade. Hackney Council is a member of the West

Anglia Routes Group which is working with TfL and Network Rail to seek a commitment to address ongoing constraints arising from having Lea Valley services better suited to a four track mainline currently operating on a two track railway.

Although three tracking is currently planned it is important that further improvements are initiated able to lead to more frequent services along the Liverpool Street to Cambridge corridor.

Continued investment on the Tube network

Whilst we acknowledge that there are no Underground stations in Hackney we nevertheless support continued improvements to the Underground network backed by investment into new rolling stock, signalling and capacity improvements.

We would suggest that the Waterloo & City Line be given priority for investment with walk through trains to enable more passengers to be carried as an early win in advance of Crossrail 2 opening. This line provides a strategic fast connecting link between north and south London. For Hackney this is via the Central Line which serves the area around Liverpool Street and Bethnal Green, both stations close to Hackney's borough boundary.

Improvements to the bus network

Although bus services are of a more local importance we would suggest that their continued improvement is as equally important in social and economic terms. A high quality affordable, reliable and efficient bus network is essential to a prosperous capital city.

Many workers rely on buses to commute at all times of night and day. Buses are also a lifeline for an increasing elderly population who rely on them to improve their mobility.

Buses are also a relatively cheap form of public transport able to swiftly provide new residential or employment areas with improved accessibility levels. Capital investment will be needed for both the bus fleet and bus priority measures to continue to ensure a reliable and efficient bus network has priority on the capital's streets.

Cycling and Walking

We fully support local transport modes and call for Cycling and Walking to be seen as part of the UK's transport national infrastructure programme.

Hackney's Transport Strategy is seeking a cycling modal share of target (for all journeys) of 20% in 2031. A continued investment into key cycling routes, contra-flow cycling measures and safety improvements at key junctions are the type of capital interventions required.

The Council strongly supports walking as an active travel mode and to this end has identified and will continue to identify areas where public realm improvements can bring improvements to promote this mode of travel. A growing population will demand an increasing focus on improving walking and cycling infrastructure within the capital.

3. WHAT OPPORTUNITIES ARE THERE TO INCREASE THE BENEFITS AND REDUCE THE COSTS OF THE PROPOSED CROSSRAIL 2 SCHEME

A significant step has already been taken to increase the benefits by opting for the 'regional' rather than the 'metro' route to maximise access to areas where growth is envisaged.

However, further benefits could be achieved for and by the scheme if the option to unlock the potential additional growth in the east is embraced.

Further analysis is required to define the benefits and quantify the reduction in cost to the scheme and we would support the call for this work to be initiated.

The Council would also suggest that opportunities to enter into joint ventures between public and private organisations be explored. The aim to achieve greater value for the scheme and provide a return on public and private assets in addition to socio-economic outcomes.

4. WHAT ARE THE OPTIONS FOR THE FUNDING, FINANCING AND DELIVERY OF LARGE-SCALE TRANSPORT INFRASTRUCTURE IMPROVEMENTS IN LONDON, INCLUDING CROSSRAIL 2?

- **What is an appropriate local and regional contribution – given the potential distribution of benefits to businesses, residents, transport users and the wider economy – and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

As has been stated by London Councils in their submission we acknowledge that London Boroughs will need to contribute to the funding for Crossrail 2 and to this end support proposals for London as a whole to contribute up to half the cost. As the beneficiaries will be residents and businesses it is appropriate that there are contributions from both.

We have looked at the suggestions in the PWC report for a delayed start to the project but feel that the urgency is such that the start needs if anything, to be brought forward.

Residents and businesses outside London who are connected to the route and receive the benefits of Crossrail 2 should also contribute in the same way that London's residents and businesses will contribute.

8 January 2016

Dear Sirs

National Infrastructure Commission – Call for Evidence

The NIC published its call for evidence on 30 October 2015. The Terms of reference cover

1. Future investment in the North's transport Infrastructure
2. London's transport infrastructure
3. Delivering future proof energy infrastructure.

This response from the London Borough of Haringey is in relation to London's Transport Infrastructure.

London Borough of Haringey – context:

Located in North London, Haringey is one of London's 32 London Boroughs. With a population of circa 270,000 the borough has both significant pockets of wealth, and towards the eastern edges with the Lea Valley regional park, some of London's and the Country's most deprived (as measured by the indices of deprivation) communities. Northumberland Park Ward, in North Tottenham is the 2nd most deprived community in London and the 120th most deprived in England out of 7,669.

Haringey is a borough that has been identified for significant housing and employment growth. The further alteration to the London Plan 2015 increased Haringey's annual housing target by 80% (from 832 new homes p.a. to 1502) and the borough has the highest employment growth target (as a percentage) in London. Over the last 3 years, as a result of the changes to government funding, the Council's budget has shrunk by £117m .

Haringey has well advanced plans to support London and the Country's growth requirements. Alongside an adopted and up to date Local Plan, the Council is now engaged in the production of 5 development plan documents, allocating Brownfield sites across the Borough for 20,000 new homes and planning to secure 12,000 new jobs. The adopted Local plan identifies Tottenham and Wood Green as the focus for future growth. Work on Area Action Plans for Tottenham and Wood Green is progressing. Around £1bn of public and private sector investment has been made in Tottenham.

River Park House
Level 6
225 High Road
London N22 8HQ

The Council fully supports the proposals for Crossrail 2 and is working constructively with Transport for London and Network Rail officers to secure effective planning and to ensure that the opportunities to support growth and economic improvement from the new stations and greater accessibility provided by the project can be fully realised. Within Haringey, Crossrail 2 will provide up to 5 new stations, connecting the two principal growth locations of Tottenham and Wood Green to London and the wider south east – including Stansted Airport and Cambridge to the North.

What are the major economic and social challenges facing London and its commuter Hinterland over the next two to three decades?

There is growing evidence that demand for housing in London and the wider south east is impacting upon the economic performance of the region. Affordability and the rising numbers in housing poverty mean that measures to increase the supply of affordable homes for Londoners are now a matter of national importance if the productivity and economic contribution that London (and its boroughs) can make to the country is to be sustained. If growing pressure on the use of land (including the recycling of former employment space for new housing) is not to impact London's capacity to contribute to the country's economic outputs, improving access to work and employment opportunities across economic areas will be of increasing importance. Within Haringey, some 84% of people travel outside of the Borough each day to work. Around 23% of residents work in central London. Public transport use in the Borough is high with almost one third of journeys by public transport. Private car ownership fell between 2001 and 2011 and continues to fall as a percentage of the population. The key transport corridors nevertheless remain air quality management areas as a consequence of unacceptable levels of pollutants derived from road traffic.

The Borough's population has also increased by around 17% between 2001 and 2011 and continues to rise. Over the same period housing stock rose by 11%. Meanwhile, some 3.5 ha of employment land has been recycled for housing.

For Haringey's economically deprived communities, raising household incomes by supporting access to new employment and work opportunities is central to improving not only the health outcomes and the quality of life but also in reducing the costs to the public sector arising from the necessary support to address the consequences of deprivation. Affordable and effective transport options with sufficient capacity to connect these existing and growing communities with the opportunities that London represents one of the key interventions that government can make to reverse the long term decline that these areas have suffered.

The evidence from Crossrail 1 demonstrates also the significant impact upon market and developer confidence that public investment at scale can have. Locations on the Crossrail route have experienced significant increases in development activity in recent years and have made a significant contribution towards meeting London's growing housing and employment land requirements. Within Haringey, the proposed Crossrail2 stations align with the Local Plan's growth locations (and reinforce a planned spatial growth option that underpins the economic performance of key existing areas (such as Wood Green Metropolitan Town Centre) whilst providing an important catalyst for regeneration and renewal in key parts of Tottenham (notably Tottenham Hale and Northumberland Park.

These areas, notwithstanding the Council and GLA investment to date, continue to exhibit challenges – whether in respect of development viability (because of development values and significant costs) or because of investor confidence.

What are the strategic options for future investment in large scale transport infrastructure improvements in London, on road, rail and underground – including but not limited to Crossrail 2?

Haringey Council consider that because of the significant positive impacts that are considered to flow from Crossrail 2, this strategic project should be afforded significant priority within government and the GLA. The Council has received significant positive feedback from the development industry concerning the prospects for delivery arising from the identification of the Crossrail 2 station sites within Haringey. The opportunity that CR2 represents to enable sustainable higher density development in Haringey is unmatched by any other form of strategic transport investment.

Given the significant role that the North Circular Road plays in accessing opportunities in outer London, the current capacity constraints and associated environmental effects that exist on the North Circular road, at locations such as Pinkham Way in Haringey also justify further strategic transport investment by government. North London is poorly served by orbital rail and opportunities for enabling greater movement between outer London Boroughs is constrained by existing network capacity. As London's population grows, and pressure on "affordable" business premises grows in more central sites (where the contrast between residential and commercial (industrial uses) is greatest, the pressure on orbital routes (by road and rail) can be expected to increase. If this growth in outer London trips is to be accommodated further investment is considered appropriate in existing key infrastructure such as the NCR to respond to both environmental as well as localised capacity and safety issues.

Following the successful investment in the Victoria Line and with the advent of the Night Tube, continued investment in underground rail is also a priority. The Piccadilly Line (running thorough the Borough) connects the metropolitan centre of Wood Green and its hinterland with the rest of London. However, investment in new rolling stock, and track/signalling is required to ensure that the capacity of this key corridor can be maximised.

What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The Council has responded to the consultation on Crossrail 2 to support a single station option at Wood Green in place of the former 2 station strategy. The Council's position is based upon clear economic and strategic reasons but also recognises the financial benefits of this solution. Focusing the regenerative opportunities of Crossrail 2 into the heart of the Metropolitan centre of Wood Green will also, in the Council's view, maximise the benefits that can be realised from the investment proposed.

Haringey Council also considers that the long delivery times associated with Crossrail 2 means that TfL should fully explore the use of all of the land identified for both construction and delivery of the project. This includes developing a strategy to enable

positive “meanwhile use” of worksites and safeguarded land and to work with boroughs on long term solutions for worksite and over station development opportunities post implementation.

What are the options for funding, financing and delivery of large scale transport infrastructure improvements in London, including Crossrail 2?

The delivery of large scale transport infrastructure in London benefits the whole of London and the wider south east. The evidence that the Borough is presented with from developers seeking to bring forward new development in the Borough is that infrastructure costs play an important part in the delivery of new development – and directly impacts upon the achievement of important affordable housing and employment space outcomes through mixed use developments – particularly in more marginal areas of the Borough (which are in need of the investment most). Given the very broad spread of benefits from such infrastructure, the costs of delivery should be appropriately shared – and certainly should not land disproportionately on specific boroughs. Investment in rail infrastructure is of benefit not only to rail users and those located in the immediate vicinity, but also to those businesses and residents located some distance from stations. Funding for Crossrail under the existing CIL, represents a simple and transparent means by which contributions can be made towards delivery. The “infrastructure” for administration and delivery is also well established and understood. The Council would urge the commission to carefully consider the implications for any other funding regime that might be considered – and balance the costs of collection and enforcement against any potential benefit.

How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

The Council has no specific insight or views on what transferrable lessons might be derived from a study of other transport infrastructure projects. It nevertheless notes that public sector investment in strategic transport is central to unlocking growth in mature and growing cities across Europe and considers this investment to be a key part of the role of government in promoting sustainable development in line with the NPPF.

National Infrastructure Commission Evidence on Infrastructure Improvements in London

London Borough of Waltham Forest Proposal for a Crossrail 2 Line

Waltham Forest Council supports in principle introducing major new public transport infrastructure to accommodate an increase in London's population from 8.6 million today to a predicted 10 million by 2030. The Crossrail 2 scheme on its safeguarded alignment would provide significant additional public transport capacity to the north east sub region of London. The current proposals for connections towards Broxbourne and New Southgate would facilitate development in the boroughs of Hackney, Haringey and Enfield. However, the current safeguarded scheme does not connect eastwards to Waltham Forest, meaning that the borough will derive limited benefit from the scheme.

The current scheme does indicate the possibility of a future eastern spur but no information on the alignment of this is currently indicated. Waltham Forest Council considers that an eastern spur should be an essential element of the Crossrail 2 scheme from the outset. The Council would welcome the opportunity to explore the detailed alignment of this spur with stakeholders and delivery partners to ensure the borough has sufficient transport infrastructure in place to accommodate continued economic and housing growth.

In terms of the strategic role of Crossrail 2, the Council supports the key objective of accommodating housing growth and regeneration and also considers that the scheme has an important function in terms of relieving congestion on existing underground and suburban rail network. A scheme introduced on the safeguarded route would substantially reduce overcrowding on the Piccadilly and Victoria lines and on the West Anglia rail routes to East Hertfordshire and West Essex.

A potential eastern spur of Crossrail 2 would perform a similar dual function: regeneration and congestion relief. An eastern branch would help relieve congestion on the Central line which would otherwise be expected to become critical all the way from central London to Leytonstone. Latest Transport for London modelling suggests that between four and five passengers per square metre will be forced to stand by 2041 from Leytonstone with existing committed schemes in place.

With regard to the relocation of certain types of land use, such as employment land and open space, Waltham Forest Council seeks to retain these where possible, particularly employment land as this is in short supply in the borough. However, we recognise that there is a case for redesignation of land for housing-led development around public transport nodes where it is possible to implement high density residential development, in turn contributing to the cost of delivering transport infrastructure improvements. The Council has identified a number of such opportunities and is already delivering significant housing growth through the delivery of GLA Housing Zones in the west of the borough.

Work carried out for the development of TfL's North London Sub Regional Transport Plan shows that Waltham Forest has seen a higher population growth in recent years than neighbouring areas. Indeed, research carried out by the Council indicates that the actual population in the southern part of Waltham Forest is considerably higher than that indicated

by the census. This population growth is expected to continue over the next 20 years as the borough is both a desirable place to live and, relative to inner London, provides a greater range of accommodation that is more reasonably priced.

The borough has an ambitious target to deliver 12,000 new homes in the next five years, the majority these being in the southern half of the borough (the area that would benefit from a connection to Crossrail 2) with further growth planned for the following decades. There is scope for several thousand new homes in the Leyton area on a number of major development sites such as Leyton Mills Retail Park, along Orient Way and a possible scheme to deck over the A12 at Leyton/Leytonstone Central Line Stations which is being developed by Transport for London.

In recent years, Waltham Forest Council has worked with a range of strategic stakeholders and delivery partners to secure significant investment for the development and infrastructure at Queen Elizabeth Olympic Park which sits to the south of the borough; on the business case and delivery plan for Lea Bridge Station which will open in May 2016; and the introduction of network improvements and investment in transport infrastructure across east London's Overground network. On the basis of this track-record, the Council is extremely keen to work with partners to develop plans for an eastern spur of Crossrail 2 that facilitates further growth and capacity improvements in the borough and the east London sub-region as a whole.

Wandsworth Council's submission to the Crossrail 2 Growth Commission's call for evidence

December 2015

Contact – Jon Evans, Head of Policy and Communications, jevans1@wandsworth.gov.uk, 020 8871 7815

Question	Wandsworth Council's response
<u>The strategic role of Crossrail 2</u>	
<ul style="list-style-type: none"> Do you agree with the analysis of national/ regional economic trends which are integral to Crossrail 2's business case? 	<p>Yes, the Council fully supports the business case for Crossrail 2 (CR2), and has been an active supporter for many years.</p>
<ul style="list-style-type: none"> Do you support a key objective of Crossrail 2, which is to 'accommodate housing growth and regeneration across London and surrounding regions'? 	<p>Yes.</p> <p>The Council believes that CR2 has the potential to drive growth both within and beyond London – just as we are seeing in Crossrail 1 and the Northern Line Extension in the north east of our borough at Nine Elms (although the Commission do still need to be realistic about the scale of growth which can be achieved around stations). Therefore we expect to see that the burden of funding doesn't fall just to London or inner London, but that the scheme is looked at in its entirety. For example, a CIL or business rates levy funding mechanism could equally (and proportionately) apply to all areas where growth is expected to occur. In other words, all land and property owners who benefit in any significant way from the project should pay their share, regardless of where they are located.</p>
<ul style="list-style-type: none"> What are your thoughts on the displacement or relocation of certain types of land use, or co-location of employment and housing, to optimise the delivery of new homes around key public transport nodes? 	<p>We would wish to see land designated for some form of employment use protected as far as possible given the benefits we have seen of mixed quarters which combine housing and a commercial use. Transport improvements such as CR2 would enhance opportunities to provide more housing and better connected and attractive office and retail space in Wandsworth.</p> <p>The location of stations we feel should continue to consider the wider benefits and opportunities of enhanced transport links. A case in point is our continued support for a CR2 station at Tooting Broadway (in preference to Balham) given the potential for the station to have a much more profound impact in the Tooting area.</p>
<u>The local opportunities offered by Crossrail 2</u>	
<ul style="list-style-type: none"> What do you perceive to be the benefits of Crossrail 2 in your area of interest? 	<p>For Wandsworth there are five key benefits:</p>

Question	Wandsworth Council's response
	<ul style="list-style-type: none"> • The northern line which runs through Wandsworth is currently at capacity. Northern line relief is a stated aim of Crossrail 2 to the south of central London and this is something the Council fully supports. • Enhanced travel opportunities for residents of the borough, providing easier access to a larger job market. • An interchange with Clapham Junction has potential to further assist in securing major redevelopment in this area and particularly beyond the Council's existing and advanced plans to regenerate its two large council estates immediately adjacent to Clapham Junction Station. There is also the potential further and more comprehensively regenerate the Station itself and these plans should be bought forward in parallel. • Given that Crossrail 2 extends to the south of London it is very likely to provide relief on the over-ground suburban routes through the borough (e.g. Wimbledon – Earlsfield – Clapham Junction) which are currently highly congested and only likely to get worse. It can also provide alternative access to central London from South London, avoiding an interchange at busy London termini, such as London Victoria and London Waterloo. • The original alignment through Wandsworth, which this Council strongly supports, would see the creation of a station at Tooting Broadway. As identified, Tooting is an area where there is significant potential for regeneration and economic growth and in turn the potential for cross subsidy. Transport infrastructure like CR2 will unlock that potential and also give greater accessibility to employment for residents. The proposed revised alignment in Balham will see less potential for growth. <p>It is important, given the pressure that existing transport is under, that these benefits are realised from CR2 <u>without</u> impacting on the capacity (short, medium and longer term) of existing over-ground suburban routes serving Wandsworth and the region.</p>
<ul style="list-style-type: none"> • Are there any key sites in your area of interest that you think Crossrail 2 could trigger a significant change in land use or the density of development? 	<p>The Council believes there is significant potential to see areas in the GLA designated Housing Zone redeveloped; in particular Clapham Junction station and areas to the South of the station which would compliment development taking place to the north between the station and the river. This should act as the catalyst to deliver an ambitious masterplan for the station itself (which may include over-decking the platforms creating significant mixed use opportunity). Clapham Junction could also be a prime employment centre given its significant accessibility to a large are of south-west London and beyond.</p>

Question	Wandsworth Council's response
<ul style="list-style-type: none"> To what extent is additional supporting infrastructure required to capitalise on the growth that Crossrail 2 could unlock? 	<p>Clapham Junction area – unlocking growth will require considerable re-design of the station – for example – over decking the platforms to create significant mixed use space.</p> <p>A further extension of the Northern Line from Battersea to Clapham Junction is supported by the Council and would create a key Northern Line – CR2 interchange – as well as unlocking further development opportunity.</p> <p>We also believe that some redesign of bus routes, standing areas and pick up points might better serve the growing residential quarter now being developed along the river and closer to Clapham junction.</p>
<p><u>Successful delivery and potential barriers</u></p>	
<ul style="list-style-type: none"> To what extent are you encouraging significant housing and employment growth? 	<p>To a very large extent. Through its new “Wandsworth Housing Offer” the Council has forecast that a minimum 18,000 new homes will be delivered over the next 10 years –one of the highest London Plan targets for any London Borough.</p> <p>Nine Elms, itself unlocked by the Northern Line Extension, is delivering 20,000 new homes and as many new jobs. Significant efforts are underway by the Council working in partnership with developers to secure employment for local people in the construction phase, which will reach its peak in the coming year.</p> <p>The area around Clapham Junction is already designated as a Mayoral Housing Zone with a target to deliver across the area 5,000 new homes over the next 10 years and improved and better connected commercial space.</p> <p>The Council is leading this drive through its already advanced plans to regenerate its two large estates north of Clapham Junction Station to deliver over 2,000 new homes. Further significant development will be delivered between York Road and the River Thames with this development being supported in turn by a newly adopted Supplementary Planning Document which will underpin increased levels of development in this area. CR2 will only help to drive and hasten delivery.</p> <p>In terms of the Council's estate regeneration plans, a development partner is now being procured by the Council to deliver large scale regeneration of these inner city housing estates (Winstanley and York Road), creating many more and better homes and a much improved local environment. The scheme will also include a new piazza area outside of the north side entrance to Clapham Junction Station and the</p>

Question	Wandsworth Council's response
	opportunity to provide possibly the best connected commercial and housing accommodation in South London.
<ul style="list-style-type: none"> To what extent are developments which are coming forward now in your area of interest in the absence of Crossrail 2 - compatible with local and regional plan designations and guidance? 	Developments are all compatible with the London Plan.
<ul style="list-style-type: none"> What potential do you think Crossrail 2 has to strengthen the employment market in your area of interest? Are any external factors needed to maximise Crossrail 2's beneficial impacts? 	<p>Key potential surrounds Clapham Junction and the ability to enhance commercial space in this area.</p> <p>Current permitted development poses a significant threat to business space in Wandsworth and therefore employment; if there is not consensus and agreement to protect such space and indeed enhance the commercial offer which is likely to have a significant benefit to the funding of CR2.</p>
<ul style="list-style-type: none"> What are the most significant barriers to achieving any additional development opportunities that might come forward as a result of Crossrail 2? 	<p>The current thinking about the realignment via Balham is a key issue for this Council and its residents.</p> <p>A regeneration master plan could unlock significant development and economic growth potential in the Tooting area (and beyond towards areas like Colliers Wood). The Council believes the potential for this economic growth far outweighs that achievable in Balham.</p> <p>Whilst we accept that the geological surveys indicate that Tooting Broadway will present additional technical construction challenges, TfL/Network Rail must weigh-up all the arguments very carefully - and certainly factor in the economic growth potential around Tooting Broadway station <u>before</u> taking any decision to move the alignment to Balham.</p> <p>Tooting's case is further strengthened over Balham if the following are considered:-</p> <ul style="list-style-type: none"> St George's hospital in Tooting – currently one of the poorest connected major trauma hospitals in the capital. A CR2 station at Tooting Broadway is likely to provide greater relief for the northern line than Balham (which is already connected into London Victoria). According to the Government's Indices of Multiple Deprivation (2015), the Tooting area is significantly more deprived than Balham; a clear indication of the potential for CR2 to bring economic regeneration and better access to jobs for thousands of residents.

Question	Wandsworth Council's response
	<ul style="list-style-type: none"> • Tooting Broadway is currently a major interchange for buses from across the south and south west of London – much more so than Balham. <p>In addition, unlocking the very significant development potential around <u>Clapham Junction Station</u> (which is already in progress) will require both public (TfL, Network Rail) and private (see private landholdings to the north and east of the station) land owners to come together and master plan to unlock development potential. The Council already has kick started this process on its own estates and it is now for others to come forward and commit to a more comprehensive regeneration plan that can be supported, sponsored and enabled by both regional and national government.</p>

CONTENTS

- INTRODUCTION 1
- QUESTION 1 2
- QUESTION 2 3
- QUESTION 3 5
- QUESTION 4 7
- QUESTION 5 8

On the 13th November 2015, the National Infrastructure Commission published a Call for Evidence with respect to three core themes:

- 1. Connecting Northern Cities**
- 2. London's Transport Infrastructure**
- 3. Electricity Interconnection and storage**

This paper comprises the response of Arcadis UK to the second of those themes, **London's Transport Infrastructure.**

Introduction

Whilst we absolutely understand the desire of the Commission to seek responses that are grounded in evidence and data, the overall vision and strategy for London is exciting and will undoubtedly lead to a step change in infrastructure and therefore economic outcomes, there is a concern that existing approaches to investment appraisal will lead to sub optimal outcomes.

Therefore, we have taken an approach that seeks to provide some guidance to overcome some of these challenges by referring to our experience in other countries, and looked at the strategic question of how to value the benefits of the various competing investment interventions and how to prioritise them in what will inevitably be a constrained funding environment.

We look forward to discussing this submission with the Commission in due course and expanding on both the themes and Case Studies contained within it, and to providing any additional information and analysis from the rich library of other case studies developed by Arcadis.

Question 1 – What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London is home to 8.6 million people, is projected to grow to 10 million by 2030 and, assuming trend rates of economic growth continue, become a city of over 11 million by 2050. London competes on a global stage as one of the greatest cities on earth and if it (and the UK) is to continue to deliver the benefits that flow from this status it needs to maintain its competitive advantage. Yet London is suffering from an acute shortage of affordable housing (200,000 additional units by 2030), education (600 new schools by 2050) and healthcare, and together with congestion and its aging infrastructure, means the city is becoming an increasingly less attractive place to live and work.

Attracting and retaining the talent required to maintain London's competitive advantage would depend on the ability to improve the quality of life for Londoners (and its hinterland). Managing the impact of climate change and changing the behaviours around public consumption of (what are now regarded as) basic human needs such as electricity, gas, water, and now data, are critical to the next generation and delivering a more sustainable environment.

This pace of change brings into question London's ability to fund this growth and ambition. Current funding models will not always be flexible enough to meet the demands of the city, and the ability for London and the surrounding hinterland to work together and be more flexible and agile; will be critical to its success. London's Infrastructure Plan alone calls for around £1.3trn of required investment through to 2050 to satisfy this demand.

London has extremes of wealth, with the very wealthy central London and the whole western corridor out to the Thames Valley self-evident. What is less obvious is that London also has some of the most deprived areas of poverty in the country. Rebalancing and redistributing some of London's wealth creation along its North/South axis and eastern corridor are real opportunities to address shortfalls in housing and employment to stimulate wider economic and social benefit.

Question 2 – What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2

The strategic options should be driven by the need to both rebalance London's economy as well as address London's wider growth agenda. This growth agenda is likely to result in the need for extra capacity on key corridors to alleviate congestion as well as improve journey times for all modes.

These strategic options should also be assessed using an appraisal framework that takes full account of the additional agglomeration benefits that would be derived from creating a faster, more frequent and more integrated London regional transport network. Whilst individual projects such as Crossrail 2 will undoubtedly have a significant impact, the wider network effects ought to be greater than the sum of the parts.

For example, traditional project appraisal would tend to look at the business cases for projects such as Crossrail 2, Bakerloo Line Extension and the Overground to Barking in isolation. However, couple this with the potential investment by Network Rail to upgrade the West Anglian line into Liverpool Street to four tracks, and then both put into the wider regeneration context of accelerating growth to the opportunity areas of Upper Lea Valley and North Bexley. The result is the creation of vibrant and dynamic wider economic zones forming a Northern corridor from London to the knowledge economy powerhouse of Cambridge, including the international transport hub of Stansted Airport.

A similar approach could be used to connect the South Coast upgrade into Victoria Station via Croydon create another linear economic zone including another international transit hub at Gatwick Airport. Indeed, whilst Arcadis understands the NIC has not asked for responses on Aviation capacity, we do feel justified in pointing out these additional benefits bought by the wider connectivity along a North/South axis for London and the surrounding hinterland. Additional runways can be built at all of Gatwick, Stansted and Birmingham (leveraging HS2 links) airports for the same level of investment as required by a single third runway at Heathrow, and would deliver similar economic gains.

Arcadis has used this approach to create models that maximise social and economic benefits for transportation links in other countries such as Asia and North America, and would be happy to share these with The Commission.

Of course, London and its hinterland is not a homogenous region. Whilst economic zones of considerable size could be created (such as The City, through the Lea Valley and then to Cambridge via Stansted), the needs of the citizens in this region will be very different to those in other parts of London and the South East. Given the fact that funding is always more constrained than would be ideal, choices have to be made and that means determining priorities. Sometimes those choices will have to be made taking account of qualitative as well as quantitative factors.

Arcadis has therefore developed a framework that enables policy makers to prioritise these strategic choices.

Prioritisation Framework

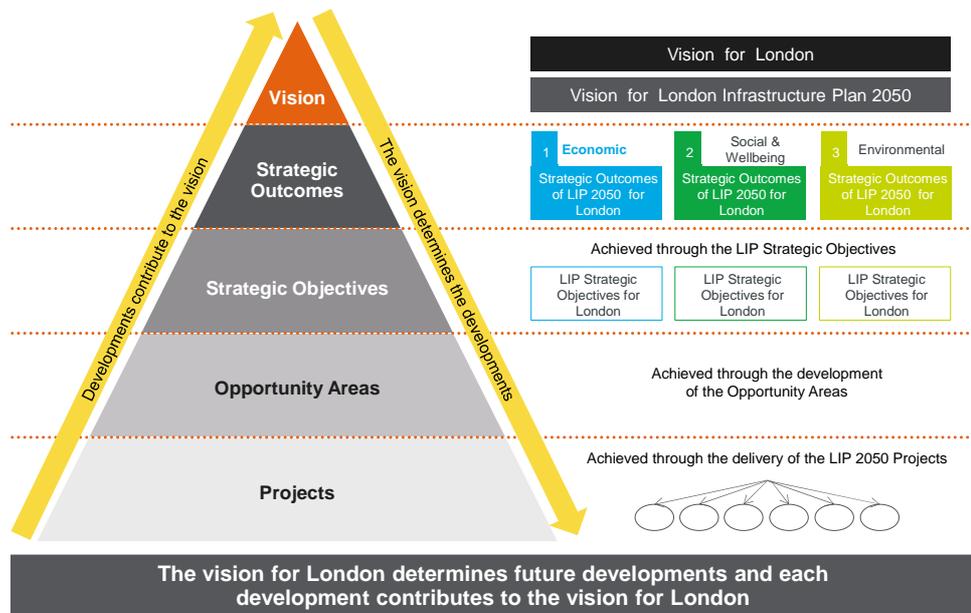

The establishment of a comprehensive appraisal framework that gives relevant weighting on a project-by-project basis and with appropriate local and regional context to:

- Direct User Benefits;
- Productivity Benefits;
- Investment and Employment Benefits;
- Changes in Land Use Planning.

will result in a more rounded approach to project appraisal.

A prioritisation framework is needed that takes account of factors that cannot always be easily quantified. Arcadis has experience of developing such a framework in London where the needs and agenda of the various Boroughs and Regions are often not aligned either economically or even politically, even though they all still see the benefit of functioning as a wider City Region. Below is an illustration of how the model works;

Prioritisation Framework Principles

A series of KPI's are developed for each of the strategic objectives that flow through to the Opportunity Areas to ensure the benefits are delivered over lifetime of the investment plan. These include employment, productivity and housing supply.

Question 3 – What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Having identified in Question 2 the benefits to be derived from a more integrated network that seeks to address both the needs to support the growth in London's wider economy as well as rebalance it, the question for Crossrail 2 is will the route currently being proposed support these objectives as much as it could do?

The criteria for assessing benefits needs to be broader than might traditionally have been the case. For example, is it correct that the benefit assessment for every station should be limited to a 1km radius from the station when the demographics for each are different? The private sector will always maximise their investment opportunity in a way the current appraisal model does not properly capture, particularly for densification and infill. Crossrail 2 will need to think and act more like a developer who runs rail networks, a good example of this approach being MTR in Hong Kong. London is a city with high land values with a growing population, and these land values could be sustained along the entire line of route with the right approach.

Arcadis have developed a model that assesses the wider social and economic benefits beyond the conventional scheme appraisal and this is set out in the case study below.

CASE STUDY – INTERNATIONAL RAIL PROJECT

Arcadis was commissioned by the Government of a major and rapidly developing country to undertake a socio-economic impact assessment study for a transformational investment in high-speed rail infrastructure. Having studied available literature and ex-post assessments of the economic benefits of High Speed Rail (the number and quality of such studies being still limited), Arcadis developed a new methodology to the ex-ante assessment of the economic benefits of High Speed Rail – the Socio Economic Development Plan.

The methodology assumes that rather than simply build the infrastructure and assume the private sector will respond to the availability of infrastructure by investing (which to an extent they will), a more accelerated and optimised approach to stimulating economic growth would come from a structured and proactive approach on the part of Government, whether national, regional or local. By assessing local physical, social and economic opportunities and aligning them to the broader economic and industrial strategy of the Government, we were able to identify for each of the principal economic centres on the line route, the industry clusters most likely to benefit from the introduction of a High Speed Railway and contribute the most to Agglomeration effects.

The opportunities identified through this process included:

- Physical Development – Integrated and Planned Land Use.
- Socio- Economic Development – Regeneration of key centres as well as improved mobility / development of talent.
- Business Opportunities – dramatic acceleration of the growth of emerging industry clusters (many in advanced and emerging technologies) through links to new customers and markets.
- Monetisation Opportunities – Land value increases generally as well as specific development opportunities at transportation hubs.

Overall, we determined that this approach could support a doubling of GDP compared to the current forecast for the same corridor over the next half century. Whilst the project was undertaken in a country with different socio—economic characteristics than the Northern Powerhouse region as well as being in a very different phase of economic and industrial maturity, the approach adopted in terms of planned interventions to maximise the Agglomeration benefits from major transport infrastructure has many similarities worth evaluating.

The influence of Crossrail 2 on regional networks should not be discounted either as 6-8 train paths per hour will be freed up into Liverpool Street and Victoria stations. Along the New Southgate branch a connection to Network Rail at Seven Sisters should be made.

In terms of cost reduction opportunities, in assessing whether the current route is in fact the right one, Arcadis believe you could omit King Road station (£600m saving) and with the Piccadilly Line upgrades being undertaken this calls into question the rationale for the New Southgate branch.

Question 4 – What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

The London Finance Commission has outlined its approach for funding London's infrastructure, largely based on keeping a greater share of the tax receipts generated by the city. Whilst this is a model that should be considered, Arcadis believe approaches are valid and possibly, in a hybrid form i.e. parts of different models used in tandem.

One of the challenges is to use models that are understood by lenders and investors and the risk profile can be managed. Some options for further consideration should be;

- For large one-off projects, the funding model used for Thames Tideway Tunnel and creating a separate Regulated Asset Base (RAB) has its place.
- London should utilize its asset base to create a balance Sheet approach. This would allow access to borrowing that is currently not available and is how the private sector would operate.
- Creating 'London Bonds' that finance a portfolio of projects and/or areas of regeneration.
- PPP – a model that has a poor reputation in the UK but commonplace in Europe and the United States.
- Community Infrastructure Levies (CIL's).
- Tax Increment Finance (TIF).

What the above illustrates is there are already a number of tried and tested models that should not limit London's ability to invest in its infrastructure. The finance is available. What is required are the conditions to invest i.e. stable policies.

Question 5 – How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied to London?

Arcadis has considerable experience of responding to similar challenges in cities in other countries. We have set out below one such case study in New York City that could be applied to London.

New York City will use the Lower Manhattan Resiliency Project (aka The Big U) to strengthen social and economic resiliency in climate-vulnerable communities, and to enhance the City's coastal defences in response to the evolving risks associated with climate change and other 21st century threats.

Lower Manhattan and its residents remain vulnerable to the impacts of climate change and sea level rise. The City's project, "**Protect and Connect**," will integrate physical and social resiliency into the diverse communities of Lower Manhattan through the implementation of physical projects, programmes, and policies. This will provide integrated flood protection to maintain the social and economic viability of neighbourhoods, and invest in resilient affordable housing by adapting building systems and neighbourhood infrastructure to protect homes from climate stressors. (see link

http://www.nycedc.com/sites/default/files/filemanager/Projects/Seaport_City/Southern_Manhattan_Coastal_Protection_Study_-_Evaluating_the_Feasibility_of_a_Multi-Purpose_Levee.pdf)

The funding vehicle was a Multi-Purpose Levee (MPL) which;

- Enhanced flood protection for Southern Manhattan.
- Resiliency programme funding source (i.e., the ability to self-finance and/or generate surplus revenue to fund other resiliency efforts); and
- Economic and community development (i.e., new economic activity, affordable housing, and open space; integration with Southern Manhattan's urban fabric and character).

The private sector developer revenues were projected from two sources;

1. The phased disposition of the rights to create new residential (market rate and affordable), office, retail, and hotel development on the MPL, in accordance with certain space absorption estimates; and
2. Ongoing property tax or equivalent payments in lieu of taxes ("PILOT") from new buildings on the MPL.

Revenues from development rights were estimated by modelling hypothetical vertical development cash flows for each of the uses described above and solving for the amount private developers would be willing to pay per square foot for the right to build each product type. These "residual" values per square foot were multiplied by the projected development programme for each development parcel to determine the revenue generation potential of each parcel in each of the different flood protection options under review. Payments for development rights were assumed to consist of a ground lease, structured as either a lump sum payment or a stream of future cash flows (the latter were calibrated to equal a lump sum payment in net present value terms).

The ground lease was assumed to generate a modest reduction in the value of development rights compared to land sale, which is consistent with observed conditions at other local sites subject to a ground lease such as Battery Park City.

This Feasibility Study's financial analysis relies on a number of assumptions relating to rents, operating expenses, property taxes, tax incentives, tenant improvements and leasing commissions for commercial uses, exit sales for income-generating uses, as well as sale prices for condominiums. These assumptions are based on historic data for Southern Manhattan's neighbourhoods, as well as reasonable projections of future conditions. Residential development on the MPL was assumed to be 20% affordable housing and 80% market rate housing.

In addition to the revenues generated through development rights, this Feasibility Study examined the revenues from property taxes or PILOT. The NYC Department of Finance provides detailed estimates of property taxes per square foot, by use and neighbourhood, in its "FY 2014 Guidelines for Properties Valued Based on the Income Approach, Including Office Buildings, Retail, Garages, Hotels, and Residential Properties." The Financial Feasibility analysis projects annual property tax revenues for each new development parcel on the MPL based on these estimates, which are weighted to reflect the breakout of each use on each such parcel.

Project costs can be financed with a range of different options. Depending on the magnitude of those costs, the availability of funds, and the preferences of decision makers, project costs could be financed:

- Directly through City, state and/or federal government capital budgets (and those of their component entities).
- With revenue bonds tied to on-site development proceeds and PILOT, with or without a public sector guarantee.
- By a private master developer in exchange for the right to develop on newly created parcels; or
- By a hybrid of these options.

Given the magnitude of potential MPL project costs and the range of potential new development on the different MPL typologies, a private master developer is unlikely to independently finance all project costs, even in exchange for the right to all project revenues. At the same time, given the constrained budgets of the City, state and federal governments, public capital grants would likely not be available to cover more than a portion of project costs.

The Feasibility Study assumes that a future MPL project would largely be funded with a combination of General Obligation bonds and revenue bonds. The latter requires public credit enhancement and/or debt service support, at least in the earliest phases of the project (i.e., before a critical mass of revenue-generating uses is completed). Therefore, to compare future costs and revenues, the financial feasibility analysis applies a discount rate associated with publicly supported infrastructure projects.

Project Financing Structures

The magnitude of project costs, as well as the potentially long gap between the beginning of MPL construction and the first deliveries of revenue-generating uses, suggests that a future MPL project may require some upfront public support to cover infrastructure costs. Depending on the option selected and a range of future decisions by policy makers, this public support requirement may vary. For example, a project with a higher affordable housing requirement or lower density would generate lower

revenues and could require a greater financial role for the public sector. This public sector role could include:

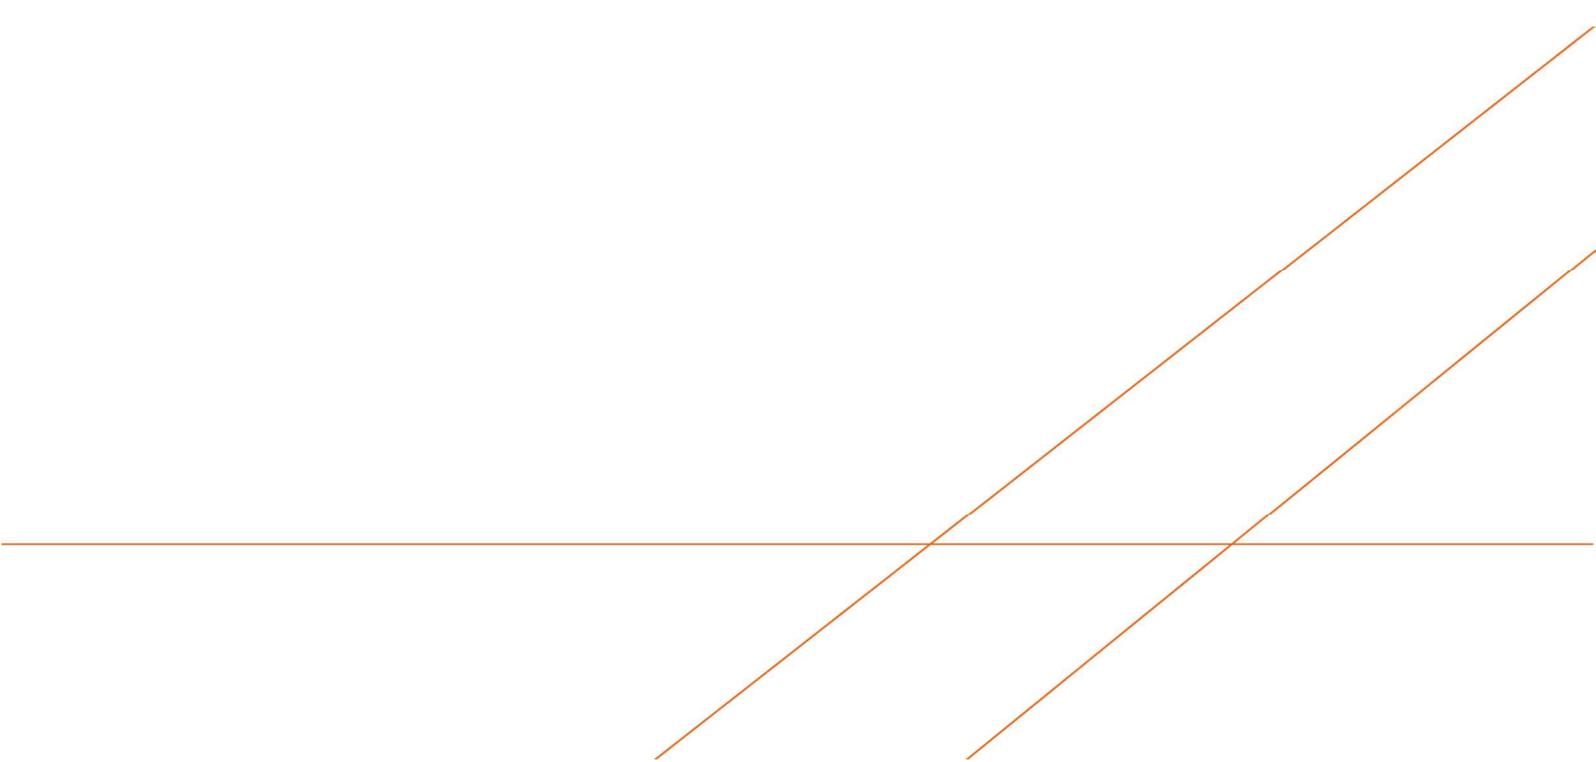

- Credit enhancement for initial bond issues, likely a requirement given the perception of risk during the early years of a new project.
- Debt service support prior to the completion of revenue-generating uses in order to minimize capitalized interest costs; and
- Capital grants from federal, state or City agencies to cover certain upfront costs as available.
- Project revenues, consisting largely of land sale or ground-lease payments and PILOT or property tax payments, would become substantial as the project is built out. Over time, these revenues could cover all required interest payments and pay down outstanding principal on infrastructure bonds. The time required to retire infrastructure bonds would depend on the degree of upfront public capital support and the degree to which capitalised interest can be avoided prior to the completion of revenue-generating uses.

The lesson for London is simply that there are proven funding models for the public and private sectors to work together, all it takes is political will.

Dear Sir/Madam

NIC Consultation – London’s Transport Infrastructure

For this topic area, we have not attempted to answer each question as set, however, we would hope it may be helpful to contribute some remarks that might inform the process and suggest a direction toward future lines of enquiry.

London’s Transport Infrastructure

London is a “world city”. It is a leading financial and commercial sector, hosting many of the world’s leading banks and corporations. It is a global hub for professional, legal, accounting, consultancy, and media related services. It is home to world-class research and development in numerous fields supported by a thriving academic network. And London is a global cultural centre, boasting world-class museums, galleries, theatres and night life.

In short, it is a thriving 24/7 metropolis that ranks among the most desirable locations to live and work in the world.

Much of that success is built on major infrastructure projects delivered successfully over the city’s history from Bazalgette’s sewers to the Jubilee Line Extension. Yet there is no room for complacency. As globalisation takes hold, there has never been a more pressing need to prepare for the future and ensure the Capital is fully equipped to compete in the new global marketplace, while providing for the domestic needs of its citizens.

With the capital’s population growing faster than homes, jobs and infrastructure can keep pace with, the case for strategic infrastructure investment is pronounced. London’s population is expected to increase from the current 8.6 million to more than 10 million by 2030 and reach a staggering 11.3 million by 2050. This prompts the obvious question ‘where will everyone live and work?’

Not only that, but London is also a major generator of wealth within the UK, so it is critical that London retains its pre-eminent role as an engine of growth for UK plc, as well as providing a roadmap for progress in other cities around the country.

London must remain competitive and it must remain an attractive place to live and work. Not just for the mobile global citizens contributing to the city's growth, but also for the many millions of Londoners who provide the critical lifeblood of the city. As such, London has to provide the hard and soft infrastructure needed to meet the needs of everyone.

To do so means supporting thriving commercial hubs alongside varied and affordable housing, as well as delivering accessible social infrastructure linked by seamless and effective, integrated transport systems.

Infrastructure investment in London can therefore no longer be a series of speculative thoughts about what could be delivered in the future. Rather it must deliver a comprehensive series of packages to drive growth and demonstrate to investors that London can and will stay ahead of the curve.

London's strong performance can support the infrastructure investment required in the North and elsewhere. However, the purse strings cannot simply sit within public sector coffers. A new system of funding and de-risking projects needs to be explored in partnership with the commercial sector. Options for new financial vehicles and delivery arrangements akin to some of the successful projects delivered in recent years across the USA and Asia should be carefully examined as part of the Commission's process to find appropriate and new financial solutions.

The transport element here provides a major challenge for London. Not only is much of London's existing transport network over 100 years old, it is operating at a capacity level way beyond that envisaged by the original design. As a result, London's road and rail networks require a high level of maintenance to operate at these levels.

Under-investment in this area would represent a clear brake on the city's prospects for development and growth. Equally a massive shortage of affordable housing, especially adjacent to good transport facilities, represents a potential curb on future development and the city's global status.

There are a number of potential schemes which address some of the issues and should certainly feature on the core list of priorities including the Upper and Lower Lee Valley, Barking Peninsula, Old Oak Common, Ebbsfleet and other areas of South London. Additionally, there is a need to investigate the multiple value outcomes of future infrastructure which includes flooding, landscape, development value, and transport with multiple outcomes which should be acknowledged earlier on in the cost benefit analysis of projects.

A particular project that Arup considers fundamental to the infrastructure investment plan in London is Crossrail 2. It needs to deliver an ambitious scheme which links the fortunes of highly productive parts of London, with other areas of latent potential. Yet, we also consider an approach should be taken where Crossrail 2 has a focus on orbital connectivity so that we do not see 'all roads leading to the CAZ and major employment areas', but instead to capitalise on the opportunity to develop successful growth nodes in outer parts of the capital.

Analysis points to the need to improve orbital connectivity around London and we think can be delivered incrementally with less burden on financial resources. The case is particularly strong when looking to areas with latent potential to deliver housing and employment clusters. Moreover, links to strategic growth corridors stretching out of

London to places like Cambridge, Gatwick and Brighton provide a growth story greater than the sum of its parts.

Looking to these examples, it is the ability to deliver jobs and homes which drives the choices for the route, rather than the route dictating the growth. In the instance of connecting Wimbledon to Croydon, a whole new corridor for connectivity could drive investment and jobs to supplement the growth of CAZ with new opportunities for complimentary growth corridors.

A link from Purley to Gatwick that takes in a link to Crossrail at Heathrow also provides for a series of employment and housing opportunities that will be lost with a radial route straight through the centre of London.

Our proposal is to consider a 'star and cluster' approach to London's growth which improves connections in these areas, with targeted regeneration investment alongside to transform the places which need it most, including Croydon, Barking and the Upper Lee Valley.

The challenge for the NIC will be to decide which projects are the easiest to fund; which offer the maximum potential for development; and which provide the greatest capacity and resilience gain for the network as a whole. It is undoubtedly a challenging prospect, but one that will be made easier with the advent of the NIC and a chance to develop a truly long-term view of how the UK should meet the needs of the Capital.

Arup stands ready to support the work of the NIC in the months and years ahead to make this initiative a success for the benefit of both London and the UK as a whole.

Yours faithfully

James Kenny
Head of Global Affairs, Arup

ACE Evidence: London's Transport Infrastructure

ACE response to the:

National Infrastructure Commission Call for Evidence

8 January 2016

About ACE

As the leading business association in the sector, ACE represents the interests of professional consultancy and engineering companies large and small in the UK. Many of our member companies have gained international recognition and acclaim and employ over 250,000 staff worldwide.

ACE members are at the heart of delivering, maintaining and upgrading our buildings, structures and infrastructure. They provide specialist services to a diverse range of sectors including water, transportation, housing and energy.

The ACE membership acts as the bridge between consultants, engineers and the wider construction sector who make an estimated contribution of £15bn to the nation's economy with the wider construction market contributing a further £90bn.

ACE's powerful representation and lobbying to government, major clients, the media and other key stakeholders, enables it to promote the critical contribution that engineers and consultants make to the nation's developing infrastructure.

Through our publications, market intelligence, events and networking, business guidance and personal contact, we provide a cohesive approach and direction for our members and the wider industry. In recognising the dynamics of our industry, we support and encourage our members in all aspects of their business, helping them to optimise performance and embrace opportunity.

Our fundamental purposes are to promote the worth of our industry and to give voice to our members. We do so with passion and vision, support and commitment, integrity and professionalism.

Q1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The story of London over the past twenty is one of success, a story that has seen the capital move from a declining, unattractive place, to one where people want to come and live and work, and in which companies wish to invest. The cities transport networks have, understandably, come under increased pressure due to this trend, and could be a significant hindrance to growth in the coming years.

In 2015, the capital's population reached 8.6 million people, surpassing the previous peak seen in 1939. The GLA's London Infrastructure Plan 2050 estimates that London's population is likely to rise by around 37 per cent to 11.3 million by the middle of this century. The higher end estimate suggests it could go as high as 13.4 million, however.¹ This growth equates to roughly two tube trains per week!

In addition, estimates suggest that there will be an additional 1.4 million jobs in London by 2050, an annual increase of 0.71 per cent, with two-thirds of these expected to be located in the inner-city boroughs. On top of this, there will be increases in visitor numbers, with the best estimates being that by 2022 around 21 million tourists will come, an increase of 40 per cent in the decade since 2012.²

In addition, and although outside the remit of the National Infrastructure Commission's terms of reference, an increase in visitor numbers will see added pressure on London's air connections. Further capacity will be required, as will the connections and ability to move passengers on the transport links to and from wherever this is provided.

All of this means there are obviously significant implications for demand, with Transport for London estimates suggesting that it will increase by up to 50 per cent, with traffic on the Underground and rail networks rising by 60 and 80 per cent, respectively.³

This will all occur in the context of increasing economic, financial, and fiscal devolution as central government continues to reduce the amount of subsidy from Whitehall to ensure the elimination of the UK's deficit. Future mayoral administrations must therefore ensure the capital must develop its own innovative funding mechanisms for the operation of Transport for London (TfL), with the aim of delivering a cost effective service for London's residents.

² *Ibid*, p. 8

³ *Ibid*, p. 9

Q2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?
- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

The needs of London in terms of its transport infrastructure, fall into roughly three categories: capacity, connectivity, and capability. There are growing challenges around and increasing and an aging population, and all that entails in terms of economic and social activities. It is, therefore, vital that our transport networks have the ability to carry increasing and diversifying demand, that they connect with where people need them to, and that organisations and individuals have the resources and abilities to deliver and make use of them.

As stated already, by 2050 the capital will need 50 per cent more public transport capacity. Crossrail 2 is, therefore, a vital project that will provide much-needed capacity on a network that will soon have to cater for ten million residents, as well as numerous commuters from outside London.

Transport for London has a swathe of other initiatives, however, including the existing upgrade programme to the Underground network that will see 36 trains per hour on the Jubilee, Piccadilly, and Northern lines by the mid-2030s. This will increase peak capacity on these lines by between 20-50 per cent.

There are also plans to extend the Bakerloo line south from Elephant and Castle to Lewisham and beyond, transforming connectivity in South London. The modernisation of key central London stations including Holborn, Euston, Victoria, and Waterloo, that will also be a catalyst for the growth and development of the surrounding areas, is also proposed.

On the rail network, the long term aim of the Mayor's Office and Transport for London is to gain further control of the commuter routes in and out of the capital. This has the potential to transform the rail network inside London's boundaries into the equivalent of a second tube network, in terms of capacity.

Through closer collaboration with Network Rail to provide more trains and carriages per hour, the authorities in London feel it is possible to carry twice as many passengers than at present, reducing crowding.

As for London's roads, in terms of strategic interventions, again Transport for London has significant plans in this area, with up to three new river crossings proposed for the capital east of Tower Bridge and a new inner orbital tolled road tunnel that could see congestion reduced by 20 per cent in central London.

ACE's members feel that the best way motorists can be supported is to provide them with a reliable asset, i.e. the road, with as little disruption as possible and as cost-effectively as possible. They feel this can best be achieved by closer collaboration with all the parties involved in this process, from Highways England, TfL, the GLA, and the boroughs.

This collaboration will have the same benefits as those outlined above. More innovative solutions will be delivered with less disruptive last-minute changes that add cost and time onto a project. Motorists will therefore be able to enjoy a better quality road and journey, traffic will flow more smoothly, and the business of the capital will be conducted more efficiently.

Continued support should also be provided for efforts to promote cycling in London, with the provision of improved infrastructure, particularly along the capital's roads and in the form of the Cycle Superhighway network. For example, 'rest areas' along the routes could be introduced with covered areas, access to tools, and volunteers from the London Cycle Campaign during weekends. This could help people adjust their bikes and provide support for those cycling with children.

Much of the work to develop these options is already being carried out by Transport for London, along with the correct staging and prioritisation of the projects across all modes of transport. ACE would encourage any recommendations from the National Infrastructure Commission to take this into account and to ensure that the construction sector's desire for certainty through a visible and stable pipeline is met as far as possible.

Q3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Crossrail 2 on its own has a cost-benefit ratio that will see around £1.80 generated for every £1 invested in the project, according to research by consulting firm PWC. This increases to a range between £2 and £2.60 when wider economic benefits are taken into consideration according to the same research and from data provided by AECOM, the global engineering firm. 4 London First in their report, Funding Crossrail 2, estimate that it could be even higher, at £4.10⁵

⁴ *Crossrail 2 Funding and Financing Study* (2014), PWC, p. 11

⁵ *Funding Crossrail 2* (2014), London First, p. 6

There exists significant opportunities, therefore, to dramatically increase the already significant benefits to London and the whole UK when constructing and operating Crossrail 2. Much of this will involve factors beyond the scope of a purely transport-focussed project and hence will need input from a multitude of stakeholders and interested parties, and require broader consideration than other projects.

There will be a massive opportunity for significant regeneration all along the route of Crossrail 2, from the area around Shepperton and Chessington in the South to Cheshunt and the upper Lea Valley in the North. This could represent a substantial number of jobs, housing, and prosperity in areas where it could do a lot of good.

In addition, this is an excellent opportunity to line up major infrastructure projects in order to get the most out of supply chain efficiencies, skills developments, and therefore save on costs. London is embarking on a number of projects that require, for instance tunnelling skills and if schemes are planned properly it will be possible for these trained experts to transfer from one project to another seamlessly.

This will have the benefit in the first instance of training up a large number of skilled experts, benefitting them and the wider economy. It will also enable the UK to position itself as a global expert in tunnelling as our engineers are trained up and gain first-hand experience of what it is like to engage in this kind of work. Finally, there will then be little need to scour the world for expertise, driving up costs, and relying on externalities not influencing the labour market.

This is just one example as well, there are multiple disciplines that will be needed to undertake a project such as this and that present an excellent opportunity in training and developing an expert workforce.

Finally, committing early, planning thoroughly, and lining the project up so that it fits seamlessly into a programme of other large-scale infrastructure projects will ensure that all companies involved in the process can themselves plan effectively, allocate resources efficiently, and enable the project to be delivered on time and on budget. Certainty is the key to delivering a project like Crossrail 2.

Q4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?
- What innovative funding mechanisms could be considered to support delivery of key schemes?

ACE supports a mixed approach to the funding and financing of London's transport infrastructure improvements, especially when it comes to Crossrail 2.

Specifically on Crossrail 2, ACE feels that much good work has been done by the London First Crossrail 2 working group, which published a report looking into this particular issue, and would encourage the National Infrastructure Commission to give strong consideration to its recommendations.⁶

Based on 2012 prices this would involve a grant from central government of around £4 billion, while Network Rail would contribute £2 billion to a final cost of around £16 billion, subject to an exact contingency figure that Treasury insists on incorporating into the total. These figures, however, would be more than recouped by government and the UK's rail infrastructure owner through increased tax revenues and reduced congestion on the existing network.

Contributions totalling just over £6 billion from the existing Transport for London farebox and borrowing based on Crossrail 2's potential farebox should also form a significant part of any funding of the project. Contributions from developers, as well as the potential for intensified development of land in and around stations could also bring in around £3.5 billion, along with another £2.5 billion in the form of council tax and business rate contributions.

A significant source of funding, however, could come from a greater amount of fiscal devolution. At present a mere seven per cent of all the tax paid by London residents is retained by the Mayor of London and the boroughs, while the equivalent figure for New York is around half.

Devolving control of property taxes, as well as lifting borrowing ceilings, in conjunction with a parallel reduction in the grant from central government would see funding of around £5 billion made available for the Mayor of London. This could then be put to use on Crossrail 2, or indeed, other infrastructure projects in due course.

This last point is an essential one too, for funding future projects beyond Crossrail 2. This fits into the government's agenda around devolution, and would be consistent with measures implemented in other areas of the country such as Cambridge and Manchester. In addition, it could also help to meet the target of eliminating the deficit and paying down the national debt.

This kind of mixed approach should be one that becomes the standard for delivering large scale, long term infrastructure in London. The exact nature of the make-up of each element should be within the remit of Transport for London, however, with the options of

⁶ London First, *ibid.*

borrowing money, requesting funds from central government, eliciting contributions from developers and business partners, all contributing.

Ultimately, this will contribute to the certainty that the construction sector requires through the ability of Transport for London to plan into the longer term and fund projects itself without as much recourse to central government. In turn, Whitehall will benefit from increases in tax revenue and improved efficiencies in the capital.

Q5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

In ACE's view, there are three case studies of major metropolitan areas in other countries that have shown innovative responses to similar challenges and priorities that London is itself facing. These are Paris in respect of long-term certainty, Hong Kong in respect of innovative funding solutions, and New York in respect of devolution of powers.

We have that in Paris, the authorities there have developed an ambitious, innovative, and fully funded plan for almost every aspect of their transport network up to 2030. Known as 'Le Nouveau Grand Paris', this has allowed all those involved to plan thoroughly, align projects to enable the efficient allocation of resources, and ensure budgets and timetables were realistic and achievable.⁷

In Hong Kong, public transport is operated by the Mass Transit Railway (MTR) Corporation, one which posted a \$2 billion profit in 2012. It did this through 'value capture', taking advantage of the uplift in values and profits through the increased passenger traffic that is provided by their services. This can then go to subsidising further expansions and upgrades, all while keeping fares low.

Finally, as stated above, we have seen New York enjoy high levels of fiscal devolution, with around 50 per cent of all tax revenues raised in the city remaining there. A similar approach in London, with more of its funds being placed at the disposal of the Mayor, would enable greater decision-making ability and allow for increased certainty through improved planning.

National Infrastructure Commission: Call for evidence

APM background

The Association for Project Management (APM) is a registered charity with over 21,000 individual and 550 corporate members making it the largest professional body its kind in Europe. APM is committed to developing and promoting project and programme management through a wide range of activities including membership, qualifications, events and enhancing standards and knowledge in the profession.

About APM's call for evidence and background of respondents

APM held an online survey which was open to members and the wider project management community. Responses came from a wide variety of business sectors such as transport and logistics, consultancy and construction as well as a broad spectrum of roles including project managers, academics and company directors. The timing of the call for evidence reduced the opportunity for the fullest consultation, so this document presents an informal synthesis of responses received, rather than a formal statement of APM policy.

NIC Call for evidence

I Connecting northern cities

1) To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?

Respondents felt that weaknesses in transport connectivity are currently playing a major role in holding back the development of enterprise creation and growth in northern cities. Job creation was also an area of concern in terms of connectivity with respondents noting that connectivity played some extent in regards to this issue. Housing was not a great issue amongst respondents, with most believing that connectivity had little or no impact on the northern housing market.

2) What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? All transport modes are open for consideration.

Some respondents noted that road users could be reduced by expanding the Manchester Metrolink into Cheshire which would primarily serve to support the Cheshire hinterland around Manchester. It was felt that Manchester Airport railway station has a useful range of services but the lack of parking, very limited pick up and no bike facilities, means it is impractical for many would be travellers particularly locals who have not flown into Manchester Airport. A railway link from Manchester Airport south connecting into the Manchester- Chester line, would considerably improve the access to the Airport from Chester and surroundings. Modern electrified rail services with fast and reliable commuter services are desperately needed throughout the north of England, both between and within cities. Rail connection to airports such as Leeds and Manchester are essential. Rail networks should also consider more reliable goods transport to take heavy goods vehicles off the road thus rail development should be prioritised over building new and enhancing existing roads.

All respondents felt that, although road transport will continue to be highly important, is important to note that it is only one form of communication and is currently close to maximum capacity. Respondents noted that by including on-line and virtual communication methods when considering infrastructure investments, it would be easier to identify the essential from the nice-to-have. It was felt that a policy of nationally driven localisation would create the capability for regions to identify and resolve their own transport needs which would speed up action and create a greater focus on sustainable regional needs.

In terms of funding, respondents believed that the current regulated privatised system in key transport modes exposes the taxpayer to all of the downside risk and the private sector to all of the upside risk. They considered whether it would be possible to run a multimodal tender where private and public sector bid on the same basis. It was felt that running a tender like this, with all costs truly pushed up front, allows for the different bodies real risk appetite to be shown, ensuring that a true cost can be identified and assessed appropriately.

3) Which city-to-city corridor(s) should be the priority for early phases of investment?

Respondents considered a number of potential corridors which they felt should be considered as priorities for early phases of investment. These included:

- The expansion of the Metrolink into Cheshire
- Hull and Grimsby (docks) to Leeds
- Leeds to Birmingham
- Leeds to Newcastle
- Manchester to Birmingham
- Manchester to Liverpool

4) What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?

It was suggested that a strategy of regional empowerment could involve some type of pan-northern political body to make the decisions. This could potentially be headed by Ministers and include northern MP's and Councils with oversight from central government to ensure that national interests were not compromised when achieving only local gains. The advantage of such an approach would be centralised information and idea sharing which might stimulate growth with sustainable solutions conceived by the areas impacted by change. It was also felt that local employers should have a voice and thus involved in the funding solution.

Funding could be from a combination of central and regional potentially supported by fairer distribution of existing subsidies, possibly away from London, and by reducing road infrastructure development in favour of rail and by private contributions from rail operators as well as government capital and borrowing.

5) What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?

Respondents believed that both Leeds-Bradford and Manchester airports had the potential for expansion but require enhanced rail links and more long distance flights in order to reduce the need to travel to airports in the south east. All respondents noted that northern ports have an important role to play in terms of international connectivity over the next 20. Sunderland, Grimsby/Immingham and Hull were cited as potential models which would serve to support UK import and exports and hopefully help support a northern powerhouse built around engineering and advanced manufacturing. Success at these ports may also open the way for Newcastle or Middlesbrough ports to be further developed to respond to changes in demand and volume.

2 London's transport infrastructure

1) What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Nearly all respondents believed that the UK is overly reliant upon London and the South East which has led to over-crowding, inflated property prices and increasing pressure upon its infrastructure and services.

Many also felt that this 'London centrality' fuelled unnecessary travelling into London whilst creating a lack of investment in the northern cities and elsewhere. Most respondents felt that incentives are needed to encourage people to move to other parts of the country to utilise the available resources and capacity in other UK settlements.

2) What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Respondents only offered limited guidance in answering this question but many felt that large scale infrastructure developments could be diverted from London to northern cities.

3 Electricity interconnection and storage

1) What changes may need to be made to the electricity market to ensure that supply and demand are balanced, whilst minimising cost to consumers, over the long-term?

Many respondents noted that in the short term, local generation through wind and solar energy should be encouraged and supported, with some local storage and less reliance on the national grid. Demand management can only be assisted by improving housing stock and price incentives. Participants noted that the UK faces a major power supply shortage with poor resilience, lack of generating capacity and poor distribution. Most of the market questions cannot be addressed adequately until secure supply is achieved.

2) What are the barriers to the deployment of energy storage capacity?

Much household demand could be for low voltage, such as can be generated by solar energy and stored in batteries. Respondents suggested that new housing might have a low voltage distribution network for lighting and electronic items. For higher voltage storage, options were limited.

3) What level of electricity interconnection is likely to be in the best interests of consumers?

Respondents believed that one of the main issues is the fragmentation of the market which makes it impossible to coordinate interconnection. Participants considered that a larger grid may not be required if there were more localised generation and storage.

National Infrastructure Commission call for evidence – London’s transport
infrastructure
IPSE response

January 2016

ADVISING
EMPOWERING
INSPIRING
SUPPORTING
ENABLING
**INDEPENDENT
PROFESSIONALS**

About IPSE:

- The Association of Independent Professionals and the Self Employed (IPSE) represents the estimated 4.5 million individuals working for themselves in the UK.
- Over 97% of our 20,000 members work through their own limited companies
- IPSE also represents 48,000 self-employed construction workers through our relationship with leading construction contract and payroll providers Hudson Contract
- Research has shown that independent professionals allow businesses to promote innovation, maximise performance across peaks and troughs in demand, and create jobs by increasing the level of innovation and efficiency in the economy.

London's transport infrastructure

- 1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?**

Housing

With London's population expected to hit ten million by 2030, the development and provision of appropriate housing is clearly going to be a major challenge in the coming years. Welcome steps are being taken to address this, for example with the £103 million funding package announced by the Mayor of London in 2012 to support the development of 2,700 homes. Similarly, IPSE was pleased to hear the announcement from the City of London that it planned to build 3,700 new homes by 2025 on housing estates and other land it owns outside the Square Mile.

To ensure these projects are fit for the way people will work in the next two to three decades, IPSE believes government should ensure that new housing developments are equipped with fibreoptic broadband as standard. This will be particularly beneficial to the growing numbers of self-employed individuals in the labour market who are looking to strike out on their own and grow a business.

There are already 4.5 million individuals working for themselves, delivering flexible expertise to a wide range of businesses while enjoying the autonomy this way of working offers. As the [2013 paper](#) by Professor Andrew Burke illustrated, independent professionals allow businesses to promote innovation, maximise performance across peaks and troughs in demand, and create jobs by increasing the level of innovation and efficiency in the economy.

This focus on housing will provide a big boost for the UK's construction sector, where 2.1 million individuals work contributing £103bn, or 6.5% of total economic output, to the UK economy.

Flexible workspace

As the labour market continues to shift, with individuals choosing the greater autonomy that comes with self-employment, government will need to pay greater attention to where people work. Those working independently are increasingly opting to work in collaborative workspaces known as "workhubs" – there are an estimated 40 in London today.

Workhubs typically consist of hot desks, meeting rooms and high speed broadband. They also offer services such as IT and business support and other training programmes. This collaborative way of working provides a motivating environment, as well as helping to build a community of like-minded individuals. As research from the Brighton Fuse project has shown, this environment allows freelancers to more easily share ideas, innovate

and ultimately grow their business. It is however difficult, and often financially prohibitive to open and run premises.

Indeed one third of 18-39 year olds identify cost as a major reason why they do not use workhubs. Freelancers unfortunately do not benefit from the tax system in the same way most small businesses do. This is because small businesses with premises are exempt from paying business rates, yet those using workhubs are effectively forced to pay them indirectly. This is because they are typically a significant part of the operating cost of many workhubs, which are often run by collectives of self-employed workers.

As this way of working becomes even more common, the planning system may prevent the speedy rollout of workhubs. Identifying a site is one thing, but getting planning permission can be difficult. Reclassifying retail properties as office space has proven difficult for a number of workhub developers.

To support this way of working, IPSE believes action is needed in four key areas:

- Cut business rates for workhubs – small businesses with a rentable value up to £10,000 are eligible for 100% business rate relief – extending this to workhubs would ensure independent professionals are also effectively incentivised to develop and grow their business
- Incentivise the use of empty properties as workhubs – councils could easily address this blight by publishing interactive maps of disused buildings in the area. This would include the dimensions of the property, its rateable value for business rates and its previous use.
- Extend Permitted Development rights to allow empty premises to change their use – government should explore allowing empty retail premises (A1, A2, A3 & A4) over 500m² to be reclassified as B1 office space under permitted development rights.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Transport connectivity is vitally important for the self-employed. IPSE survey data from 2015 found that independent professionals travel on average 1,775 miles each month to their place of work, while spending £8,056 each year on transport costs.

Investing in all forms of transport infrastructure is therefore vitally important in allowing freelancers the freedom to travel quickly, delivering flexible expertise to businesses of all sizes. When travelling by rail, policymakers can also go further in helping freelancers work on the move. Ensuring rail franchising agreements include a commitment to enabling WiFi across their networks will provide a productivity boost to the large number of freelancers who regularly travel into or from London.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

As with all large infrastructure projects, greater effort needs to be made to open up the procurement process to smaller businesses and collaborations of independent professionals. Often it is only the very largest businesses who can compete here, given the onerous compliance requirements and very complex contracts.

But this does not always lead to satisfactory outcomes. The cost and complexity of large contracts can lead to delays and ultimately hit the public purse. For example, it was widely reported in 2015 that taxpayers could be hit with a bill for up to £700m after the government reportedly lost a legal battle with Fujitsu over a failed NHS

IT system. The Fujitsu Connecting for Health contract was part of the £12bn NHS national programme for IT, large parts of which have had to be abandoned at a cost estimated by the National Audit Office to be £2.7bn.

As important infrastructure projects are delivered in London over the next twenty years, government clearly needs to move away from its dependence on larger suppliers to deliver projects, instead effectively using the unique flexible expertise that independent professionals offer and the value they deliver for complex projects.

In delivering large infrastructure problems in London, government should build on its ambition that 1 in every £3 of government spend will be with SME. It should go further in breaking up contracts, committing to a sub-target that a quarter of spend within the SME ambition will be with microbusinesses including collaborations of independent professionals.

In addition, government should commit to publishing tender documents in an open source, editable format. This would allow microbusinesses to suggest revisions and flag up aspects of the contract which present difficulties.

It is of course inevitable that some large London infrastructure contracts will be awarded to larger businesses, but this doesn't mean independent professionals have no role to play. A Cabinet Office study has found that the fifty largest suppliers to government are responsible for 35% of government spending, and there must be a role to play for our smallest businesses further down the supply chain.

IPSE believes a greater onus must be placed on these large "tier 1" contractors to demonstrate how they will open up opportunities for subcontracting to the widest possible group. Tier 1 contractors should be expected to publish details of who they contract with in order to promote accountability.

London's transport infrastructure

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London faces a number of key challenges over the coming decades. The City continues to grow at a rate not seen for many years (the fastest rate in 80 years) and our work has shown that the existing London Plan and the Mayor's London Infrastructure Plan (2050) are underestimating the level of population growth and employment growth that the city can expect over the next 25 years. This has significant implications for London in relation to how the population can be accommodated, how people will travel to work, access to job opportunities, the city's environment and quality of life. The hard and soft infrastructure that will be required to support this growth will need to be planned to deliver these greater levels of growth, but will also need to be adaptable to future changes in the economy, environment and society.

The recently published Atkins report Future Proofing London (which can be downloaded from our [website](#)) identifies four key interlinked risks that London faces which include:

- Housing - A failure to meet the city's housing needs
- Economy – the economy becomes less diverse
- Society – society becomes more unequal, and increased social tensions impact on London's stability
- Environment – the city's continued growth degrades the environment further impacting on quality of life

The following provides further detail on each of these key economic and social challenges and provides a reference to the appropriate section in the Future Proofing London report where further illustration and detail on these points can be found.

Population and employment growth greater than expect and planned for

As part of our work on Future Proofing London we worked with Oxford Economics to look at future population and employment scenarios for London. Oxford Economics forecast London's population to reach 12 million by 2050 compared to the London Infrastructure Plan (2050) that projects the population to reach 11.3 million by 2050. This is a difference equal to the current size of Manchester.

The London Infrastructure Plan forecasts jobs to reach 6.3 million by 2050, this is a level that Oxford Economics forecasts will be surpassed by 2026.

If these projections that underpin London's strategic and infrastructure planning are underestimating the level of growth that is likely in London, then the city will be failing to plan properly for its growth, and the risks we have identified will be exacerbated.

(for further detail on the population and jobs growth see section 3 pages 38-40 of Future Proofing London).

Housing

Housing is a vital piece of the city's infrastructure, without sufficient housing London cannot continue to accommodate population growth and house those that work in the city. Housing demand continues to grow as the population increases and with population estimates identified above this demand is not set to ease any time soon.

Supply is failing to keep pace with demand, current rates of housing delivery (26,000 pa) are well below London Plan housing targets of 42,000 pa, and the London Plan target itself is likely to be below what is actually required (with many suggesting 50,000 homes per annum are required).

The increasing demand for housing and the chronic undersupply of housing are combining to make housing affordability a serious issue for London. On top of this, wages have not increased at anywhere near the same rate as house prices, this is not just an issue for those on low incomes but also for those on medium incomes.

These housing issues are pushing people out of both central London and London entirely to find a place to live. Some of those moving out of London are retaining their jobs in London resulting in ever greater commuting distances.

(for further detail on housing challenges facing London see section 4 pages 45-50 of Future Proofing London).

Economy

Jobs growth over the past 15 years has been focused on the Central Activities Zone (CAZ) with less growth in outer London. With job densities much greater in inner London, many outer London residents are reliant on commuting to jobs in central London. The trend in greater job growth in inner London compared to outer London is expected to continue and as a result there will be a need to consider the implications this has for outer London communities and London's transport infrastructure.

Much of the job growth has been in high value sectors (such as professional, real estate and scientific and technical activities) again with the greatest concentrations of growth in these sectors being in inner London. However the cost of housing is impacting on the ability to fill graduate vacancies in these professional sectors. The housing crisis could lead to labour shortages (across all sectors of the economy) and / or increasing reliance on people commuting from greater distances to fill jobs.

Coupled with the growth in high value sectors has been the decline in employment in lower skilled jobs, which are forecast to decline further. This continued shift to a higher value economy has its benefits (particularly in terms of GVA growth), but it also presents challenges with regards to whether there are sufficient job opportunities available to the lower skilled population.

The sectors of the economy that will see substantial jobs growth in London are going to change, with greatest growth in professional, scientific and technical services (28% of all jobs growth 2015-2030) administrative and support (16%) and information and communication (10%)

and limited growth in financial services (0.6%) in what has traditionally been a big growth sector for London. Many of the businesses in knowledge based sectors are small scale and often rely heavily on affordable and flexible business space, rather than traditional office accommodation. With the continual loss of industrial and business space to competing land uses (such as residential) these sectors may find that land and premises availability and affordability act as a constraint on growth.

(for further detail on housing challenges facing London see section 4 pages 51-57 of Future Proofing London).

Society

Inequality in London is getting worse and poverty is shifting to the suburbs, compared to a decade ago when poverty was more evenly dispersed. Whilst the number of wealthy households in inner London has increased by 203% between 1980 and 2013. Recent data shows a large proportion of overseas buyers for inner London homes, and a high proportion of residents in inner London with second homes.

Despite the growth in London's economy, deprivation levels remain high in much of east and south east London. In west and south west London there are higher levels of residents with managerial and professional jobs and higher income levels than east and south east London.

There has been greater growth in those seeking job seekers allowance in outer London than in inner London and the growth in unemployment rates have been much higher in east and outer east London.

These clear patterns of suburbanisation of the less wealthy coupled with a forecast for more modest growth in job opportunities (particularly in higher value sectors) in outer London, will mean that the increased polarisation of London's society is set to continue. The implications of this are likely to be

- greater social unrest impacting on stability of the city
- reduced social mobility and loss of human capital, which ultimately can limit economic growth and innovation
- poorer physical and social health as a greater section of society find it difficult to access social and cultural opportunities
- more volatile economic growth

(for further detail on housing challenges facing London see section 4 pages 58-64 of Future Proofing London).

Environment

Environmental changes as a result of both climate change and the Cities population growth have the ability to impact on London's economy and society.

There is a significant amount of residential, commercial and community premises and vital infrastructure that is within the Thames tidal floodplain. Climate change could lead to increases in sea levels which in turn will increase the risk of tidal flooding and increases in heavy rainfalls

leading to an increased risk of fluvial flooding. With the potential for significant loss of life and damage to property there will be a need to ensure that London invests appropriately in ensuring its flood defence infrastructure is fit for purpose.

Surface water flooding is also a key issue and likely to increase as development of the city continues and climate change impacts take hold. London is vulnerable to surface water flooding with 16 of London's boroughs identified in the top 20 districts in England as susceptible to surface water flooding.

London is one of the most water stressed cities in the world. With an increasing population the issues related to water scarcity are likely to increase. London will need to consider how it manages water demand downwards and or looks to secure water supplies in a different way, although it will be vital that any alternative water supplies are sourced sustainably.

London is susceptible to Urban Heat Island effect due to the high-rise form and density of development. Increasing summer temperatures have the potential to lead to a greater number of heat-related deaths, an increase in respiratory illness and a decline in labour productivity.

In addition to the environmental risks associated with climate change, air quality is another challenge that London faces as it continues to grow. The majority of pollution in London comes from transport and congestion. The additional growth that is expected in London will generate additional trips with a further impact on emissions. Air quality is a significant challenge for the city as poor air quality is harmful to human health and ultimately reduces the quality of life in London.

(for further detail on housing challenges facing London see section 4 pages 65-68 of Future Proofing London).

National Infrastructure Commission

Balfour Beatty's submission to the National Infrastructure Commission inquiry into future investment in London's transport infrastructure

1. Introduction

Balfour Beatty is a leading international infrastructure group. With 20,000 employees across the UK, we provide innovative and efficient infrastructure that underpins our daily lives, supports communities and enables economic growth.

As this country's largest infrastructure Group, Balfour Beatty has more than 100 years of experience globally, and draws on the engineering skills and innovation of over 20,000 highly committed employees across the UK. Balfour Beatty finances, develops, delivers and maintains the increasingly complex infrastructure that underpins this country's daily life – in transportation, power and utility systems, social and commercial buildings. We are committed to London. From the Crossrail Liverpool Street and Whitechapel Station tunnels, to the £590 million Heathrow Terminal 2B project and the £300 million Aquatics Centre for the London Olympics, Wembley stadium, the Channel Tunnel Rail Link and soon the £416 million London 'Super Sewer' scheme, our expert teams have for many years helped to make the London landscape – both visible and invisible – what it is today, ensuring it can to continue to grow as one of the world's leading capital cities.

This note draws on our expertise to set out some of our thoughts on the key questions relating to the future of London's transport infrastructure.

London is facing unprecedented population growth, projected to reach 10 million by 2030 and more than 11 million by 2050¹. In order to support this growth, London's infrastructure will need continued investment to ensure it can maintain its status as a world class business location, competing with other top tier cities around the world and acting as a driver of the UK economy. Of course, significant transport investment is already underway in London, from Crossrail 1 to High Speed 2 and Thameslink, but more is needed. For example, much of London's commuter rail network is already operating at capacity in peak hours: additional capacity is required to tackle existing overcrowding and to support future growth.

Infrastructure requires vision, ongoing investment and consensus. Major projects take years to plan, build and develop; they are often disruptive to everyday life, especially in densely populated London, and their benefits are not felt within one electoral cycle or immediately understood by the public. The costs of disruption in London are high and the design of old-fashioned legacy systems often constrains options today. Prioritising and realising large projects requires political will. As much as possible, consensus is required for good infrastructure planning. The Olympic Park, where Balfour Beatty constructed the award-winning London 2012 Aquatics Centre, is a good example of what can be achieved with cross-party political support, while other worthwhile projects either do not happen or are slowed considerably if they do not have it.

¹ London Infrastructure Plan 2050, Mayor of London

In our view, there is a real need for clear long-term plans that have cross party support. In March 2015, the Mayor launched a long-term infrastructure plan², with the objective of setting out London's infrastructure needs and how to pay for them. As part of this, London's Infrastructure Delivery Board³ was established to bring together the interested parties in developing the programme of infrastructure works and advising on their deliverability, enabling the Mayor to seek to gain cross-party support. While Balfour Beatty welcomes the establishment of the Board, this body is still very new and has no statutory role, so it remains to be seen how effective it will be.

Balfour Beatty strongly supports investment in London's infrastructure. We believe that it is important not just to maintain London as a global city and to ensure that those that live and work there have access to the services they need, but that continued investment in the capital is vital to the UK economy as a whole. However, we would caution that investment in London or in the North of England should not be viewed as a 'zero sum game'. The two should be considered together for the good of the national economy, and both should see increased and sustained investment.

2. Responses to specific questions outlined in the Inquiry

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The challenges facing London are, in our view, mostly linked to its continued and rapid expansion. How to house the increasing population, how to transport people around the capital, and how to accommodate their other infrastructure needs including access to office space and business parks such as Tech City and the Advanced Business park, for example. There are of course many other social challenges, such as community cohesion, which we do not feel qualified to express views on. Here we outline a small number of the main challenges which we do have experience of:

- Delivering and maintaining infrastructure: London's transport infrastructure is already struggling to cope with current peak demand, a situation which will be further compounded by population growth and by plans including as High Speed 2 (HS2): the first phase of HS2 is due to open by 2026, which will mean large numbers of additional passengers to Euston station, where the Underground station is already at capacity. The opening of the second phase of HS2 in 2033 will place further burdens on routes to and from Euston.

A key economic challenge lies therefore in ensuring London's infrastructure is up to scratch. This is a twin challenge of planning and delivering new infrastructure; and ensuring the efficiency and maintenance of the city's existing infrastructure. The ability to rise to this challenge relies, in our view, on the level of forward planning and ability to adapt to changing circumstances and of course it requires regular and sufficient investment. Furthermore, infrastructure investment is most effective when developments are integrated from the initial vision, through the planning process all the way to implementation. Projects such as the Channel Tunnel Rail Link, the Jubilee line extension and Crossrail show what can be achieved when these requirements are all delivered.

While we understand that it is not part of the NIC's remit, we also believe that an early and final decision on aviation capacity in the South East needs to be taken. Of our closest competitors, Frankfurt has four runways; Schipol, six runways; and Charles de Gaulle has four runways. The continued delays are, we believe, damaging the UK's competitiveness.

² Ibid

³ <https://www.london.gov.uk/what-we-do/business-and-economy/better-infrastructure/london%E2%80%99s-infrastructure-delivery-board>

- Housing shortage: Currently, fewer than half of London's target of 42,000 homes are being built, and the numbers seem to be going in the wrong direction: there were around £4.5bn in orders for new housing construction in London in 2014/15, down 16% from the previous year⁴.

The housing shortage has a number of economic impacts. Low and middle income earners are being increasingly priced out of London. Increasing house prices are negatively impacting firms' ability to recruit and retain staff: the CBI/ CBRE London Business Survey⁵ found 32% of businesses saying that they are unable to offer flexible part-time employment due to the time/cost of the commute into London for employees who cannot afford to live locally. Similarly almost a third of firms said that employees are moving away from the local area and therefore having to leave their jobs as housing costs are too high. This is problem employers are facing now, but it is likely to get worse in future, especially for key workers such as nurses and teachers.

As some employees are forced to move further out of the capital due to rising housing costs, getting people from London's outer regions and from the wider country into London quickly and affordably is key. Transport connections are vital for commuters and Crossrail 2 will play an important role in facilitating these journeys.

Another point to consider if London is to deliver a greater amount of housing stock, is that density levels within the city may need to increase. London is not dense in comparison to places like Hong Kong for example. Discussions will be needed around the level of density that is acceptable and where this will take place.

Of course, the social angle of the housing shortage is significant. The most recent report on London poverty outlines that 1.2 million Londoners in poverty live in a working family, up 70% over the last decade⁶. The report highlights that, in a continuing trend demonstrated in the four previous editions, a key driver of poverty in London is the affordability of housing. With a shortage of affordable housing, the only option for low-income households is private renting, however, rents have increased by 19% in London in the last five years (compared to the 11% average across the country) resulting in an average private rent of £1,600 per month (more than double the £770 average in England)⁷. Indeed, average private sector rents in London are more than twice the national average for all property sizes⁸.

- Skills: London is a global city, a member of small elite group of cities that competes in an international market to attract highly skilled mobile workers in areas such as creative and media, financial services, IT software and global services. A well educated workforce and a deep skills base are crucial to enable it to maintain its position as a global city, and one which continues to see significant economic growth. However, every year India and China educate more than four million graduates, compared with just over 250,000 in the UK⁹. If something were to significantly reduce the flows of skilled immigrants from overseas into London that recent years have witnessed, this problem is likely to be compounded.

⁹ Europe Economics, The Competitiveness of London – Future Challenges from Emerging Cities, 2008

In the infrastructure industry, designing, constructing, operating and maintaining the infrastructure which keeps London moving requires specialist skills and experience. In order to make sure we have the skilled labour necessary to build the transport networks, buildings, rail and runways and so on, it is important to ensure that London develops and retains the required level of skilled resource. Business needs confidence in the quality of the pipeline in order to ensure it has the skilled staff for some of the specialist roles in major projects. This is especially the case where new skills are required for innovative schemes.

Balfour Beatty welcomes and supports the government's ambitious plans to create 3 million more apprenticeships by 2020. We invest in apprenticeship programmes across a broad range of disciplines, employing over 150 apprentices each year in the UK in addition to the 320 currently under training in a diverse range of roles across the business¹⁰. We employ around 700 more young people on graduate and part-time higher education / degree schemes. However, we do not believe that the apprenticeship levy alone will be enough to meet the shortfall in skilled workers the infrastructure industry needs.

- Flooding: Of course, the impact of flooding from the Thames would be disastrous: not just in terms of the number of businesses and dwellings sited in London and the fact that London is the UK's largest centre of activity, but the Central Government district of Whitehall is also almost entirely within the Thames floodplain. Furthermore, the damage to London's transport infrastructure would be significant: much of the central area of the Tube network is based within the floodplain and 86 railway and underground stations, eight power stations, 1,000 electricity substations and 16 hospitals could be at risk¹¹.

However, assuming that the Thames Barrier continues to perform and that the Thames Estuary 2100 plan works, the other, less manageable threat is in the form of surface water for example, following prolonged heavy rainfall in the Thames catchment area. The amount of impermeable surface cover in London, such as concrete on pavements and buildings, means that rainfall runoff from the land into the drainage systems and rivers creates a build-up of water and potentially fluvial and surface water flooding. Drainage systems may have inadequate capacity or become blocked leading to further flooding. The more building there is and the less green space, the more pronounced this problem becomes. Climate change, with its projected extremes of weather and wetter winters, is likely to add to this and the City of London have identified surface water flooding as one of the most serious challenges London faces¹². Therefore robust and effective management strategies and flood resistance and resilience measures need to be put in place in order to mitigate the risks and opportunities for integration should be capitalised on. For example, the capacity of green space to reduce flood risk is rarely factored into the planning or design of parks.

- What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Balfour Beatty's priorities for strategic investment options for London are:

- A. Crossrail 2: Crossrail 1 will deliver a 10% increase in transport capacity east to west. However, it will not address the issues of congestion levels on north-south tube and rail lines

¹⁰ <http://www.balfourbeatty.com/index.asp?pageid=364>

¹¹ The Environment Agency's "at risk" list, 2015

¹² <https://www.cityoflondon.gov.uk/services/environment-and-planning/sustainability/climate-change/Pages/surface-water-flood-risk.aspx>

and the need for significant additional capacity due to projected population growth. We believe that a new north-south line linking Wimbledon to Hackney across central London and extending into the suburbs, linking in with London Underground, London Overground, Crossrail 1, National Rail, High Speed 1, High Speed 2, London Trams and international rail services, should be approved as a matter of urgency. The urgency relates both to the need to address the two problems outlined above, but also to the need not to lose the skills and knowledge gained from Crossrail 1 due to a time lag between the two projects. The priority, in our view, is to plan the new rail line in conjunction with housing and regeneration needs.

Firm decisions on the route, a construction timetable and a credible funding package need to be made as soon as possible. We furthermore believe that additional Crossrail lines could follow.

- A. London Underground: As well as developing the new Crossrail 2 line, line upgrades and station works are still necessary to maintain a resilient underground system. We agree with Transport for London that, even with the new capacity the Tube upgrade is bringing online, it will not be enough to meet London's future needs. Investment must continue across the wider tube network: we must ensure that journeys are seamless across the whole network. There will be little point having a good quality, fast Crossrail 2 if the onward tube connections are prone to signal failure, over-crowding and delays.

Furthermore, the areas that are opened up by Crossrail 1 and the potential Crossrail 2 will mean that more people from those areas access the Underground for their onward journeys. Constant upgrades and developments must therefore be factored in as a priority.

- B. New East London river crossings: We agree with the Centre for London report¹³ that there is a need to address the severe lack of crossing capacity on the East Thames. There are three crossings to the east of Tower Bridge, compared to 16 road crossings on the 20 miles of the river west of Tower Bridge. All three of the eastern crossings are regularly congested. However, the population of East London is forecast to increase by 600,000 in the period to 2031¹⁴, and this area of the capital is a key priority for regeneration, housing and jobs.

We support a minimum of two bridges at Gallions Reach, which would connect Thamesmead with Royal Docks; and at Belvedere, which would connect north Bexley with Havering. These options were the two identified by a recent TfL consultation which received 7,500 responses, 90% of which were in favour of new river crossings in east London. The two new crossings would form part of a package alongside the Silvertown tunnel, which would connect the Greenwich Peninsula with the Royal Docks and would play a key role in supporting the population and employment growth forecast for London.

Balfour Beatty believes that the success of the toll bridge at Dartford suggests new projects could be paid for with private finance and money recouped from those using the crossings.

- C. An orbital underground ring road: This would relieve congestion around Tower Bridge and Old Street, as well as the Old Kent Road, the A40 around Acton and the A503 at Woodberry Down.

¹³ Centre for London, Linking London: A New Generation of River Crossings to Revitalise the East Thames, October 2014

¹⁴ TfL, 2015

There are also other points to consider in relation to improving London's future infrastructure, for example:

- One of our observations from our work elsewhere in the world is that, when large-scale infrastructure projects are delivered in this country, opportunities are often missed for infrastructure integration. For example, the Crossrail tunnels that are currently being built could have included broadband fibre, but will not because decisions were not made at the right time. We need to become better at considering all future infrastructure needs upfront at the inception of major projects.
- It should not all be about new infrastructure. Work is also needed to improve the capital's road network and ensure that it is fit for purpose for the projected population increase. Congested roads are a strain on the economy and the environment, impacting London's competitiveness and Londoners' overall quality of life. In our view, smart technology is needed to deal with bottlenecks at traffic junctions for example, including some of the Dynamic Traffic Forecasting methods being used in Barcelona, digital road signs, junction technology and encouraging sat-nav companies to give drivers better real time information. We support TfL's £4 billion Road Modernisation Plan and believe that it could potentially go even further, with an extension to the congestion zone, or an amended charging regime where costs vary based on those roads and times of day where congestion is worst.

3. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- Building on the Crossrail 1 model: Decisions about public expenditure on London's infrastructure investment are often not taken in such a way that the costs, or at least some of them, are borne by the people who benefit. However it is estimated that local funding sources could meet at least half of the costs of Crossrail 2¹⁵, in part by building on the Crossrail 1 model. This would include ideas such as increasing fares and building on the idea of the Olympic precept for Council tax payers. While these options may be politically unpopular, it is our view that they should be considered in line with the principle that those who benefit should carry some of the burden for the funding. It is in cases such as these that political consensus around future infrastructure priorities is important to achieve.

The Crossrail funding model is interesting in that it brings together a number of sources of funding and financing. Most notably in terms of alternative funding mechanisms it includes a supplementary business rate on larger London businesses of two pence in the pound for approximately the next 30 years. This approach was largely welcomed by London business, which is broadly supportive of the principle that tax and spending decisions should be better aligned. We support work that has been done by PWC¹⁶ and others on demonstrating how a continuation of the Business Rate Supplement and the application of a Mayoral Community Infrastructure Levy could meet 21% of the costs of Crossrail 2. The benefit of these methods having been used in Crossrail 1 lies in the fact that the principle has been established and in the learnings that can be taken from the operation of the schemes.

- Land value uplift / Tax Increment Financing (TIF): Infrastructure investments decisions need to consider all their economic returns from the outset, for example, by capturing increased land values around schemes due to improved transport connections. TIF can enable local

¹⁵ Michele Dix, TfL presentation on Crossrail 2, June 2015

http://www.newlondonarchitecture.org/docs/michle_dix--transport_for_london-1.pdf

¹⁶ PWC, Crossrail 2 Funding and Financing Study, November 2014

authorities to raise funds for infrastructure improvements which will increase economic activity in the future. It has been widely and successfully used in the US and in Hong Kong for many years and is beginning to be used in the UK. One of the conclusions from PWC's analysis is that:

"many land and property owners who have benefited most from the project are not making a commensurate contribution to the project costs"¹⁷.

Crossrail 1 is projected to add more than £5 billion¹⁸ to property values along its route, only a fraction of which is being captured to support the cost of the line. More should be captured in plans for Crossrail 2, which would reduce reliance on national taxation. This is something that could and should be addressed in advance of Crossrail 2.

- Dividing the burden between interested parties: Subdividing major projects into smaller sections with bespoke financing/funding arrangements. For example, the bulk of the project, for example the tunnelling could be simplified and funded centrally, but station development and other elements could be funded and justified separately by local authorities and/or private sector developers.
- Private sector investment in infrastructure: Although there are Pension and Infrastructure Funds for example, which could invest in London infrastructure, their investments are subject to market and policy risk. They require policy certainty from government in the form of clear up-front statements of government policy in key strategic areas, ideally, government guarantees, better coordination within government and rapid implementation of the detailed policy frameworks which can provide the certainty and longevity which the private sector needs to make the business case for infrastructure investment. While this is unlikely to be a viable option for Crossrail 2, due to the size of the scheme, it is possible that private investment could be used for other London infrastructure projects.

Much of the investment in UK infrastructure is undertaken by international businesses which have a choice of markets and projects for their scarce capital, and they will naturally choose those jurisdictions with effective policy frameworks which provide certainty over the longer term over jurisdictions which do not.

Balfour Beatty believes that commitments to long-term infrastructure plans would reduce the cost of delivering infrastructure in London and elsewhere in the country. Longer-term plans teamed with the certainty that they will be followed through would also enable the whole industry to ensure the right resources – both in terms of skills and assets - are in place to deliver. Without this certainty, for example, providers cannot start training the workers needed in the future or ensure their supply chains are in place.

CALL FOR EVIDENCE

Further to the call to Evidence for the National Infrastructure Commission we have pleasure in detailing some issues and points relating to the national challenges.

1. Improving connectivity between cities in the North of England

Recommendations for cost effective infrastructure investment

Improve the local transport infrastructure to facilitate cross-country links such as Northern Hub

One way to increase employment, housing and enterprise growth will be to concentrate on local transport improvements to facilitate cross county links such as the Northern Hub solution.

Improvements in local transport links and high quality infrastructure are essential for the North of England as they will not only benefit the communities that live there, but also those visiting / commuting to the region which is vital for the local economy.

This focus requires immediate action with full and proper collaboration across all parties including the deliverers.

Provide Superfast Broadband

Superfast broadband makes a positive impact on national and local economies. For the North of England, an area of improvement that will assist in resolving many issues is the improvement in connectivity of IT by supplying super-fast broadband (400MB+) across all the Northern cities.

Faster broadband allows a workforce to work more flexibly which can lead to greater productivity and reduced travel meaning time and money saved.

This solution is relatively low in cost and requires future proofing for at least five to ten years.

Priority early-phase investment

Improvements between Liverpool to Manchester and Leeds, then Teesside to Newcastle

As Sir David Higgins said *'Improving connectivity is vital, if Britain is to compete in the knowledge economy in which this country has a competitive advantage, but in which ease of travel is an essential element'*.

A main focus should be made, firstly, on the Liverpool to Manchester and Leeds connectivity in highways, rail and water.

This should then be followed into Teesside and Newcastle.

The governance of delivering this infrastructure and its subsequent growth needs careful consideration as the devolvement of power and funds to a region is not always cost effective.

The Northern Powerhouse needs to evolve in the same way as TfL - with close collaboration with all stakeholders involved. This will prove very effective, as it has been for London.

Whether the same can be said for the other local authorities and LEPs is questionable, therefore, effective and efficient business cases need to be agreed with monitored results and programmes.

Effective governance

Considerations for finance and funding

The funding of schemes and developments should be considered to prioritise and obtain a greater input for those that will reap the most benefit eg Crossrail 1 and business investment with developers for flood protection.

Many opportunities can be considered within a portfolio finance model with funding and support from organisations outside of the public sector. This is something innovative but difficult to obtain without buy-in from authorities that tend to revert to traditional procurement methodology.

2. London's transport infrastructure

The challenges facing London and recommendations

London is one of the most rapidly growing and congested cities in World. Hundreds of thousands of people travel to and from London for work via overcrowded networks because they have to.

A question to consider: *'Is the relentless growth in London really viable for the future?'* And *'How can this problem be alleviated?'*

Our recommendation, to overcome the infrastructure capacity challenge faced by London, is to invest heavily into adjacent regions and towns surrounding the Capital. If these areas become better and more efficiently connected, accessible and attractive, the problems faced by London will be reduced as fewer people are forced to rely on the London network.

Strategic options for future investment in large-scale transport infrastructure

Short-term solutions

In the short term we need to:

- Enable high speed connectivity and continue to improve rail capacity for the inevitable commuter journeys
- Consider how to develop 'metro type' services - improving signalling and platform usage while bypassing loops in the service
- Provide 24-hour transport services to the rail system to give passengers the ability to change their patterns of travel without any fears of accessibility to and from their place of work. Essentially dissolving the rush hour.
- Embrace the use of applications including UBER within the road network, to obtain increased usage of the highways, relieving strain on infrastructure and transport networks.

Medium-term solutions

In the medium term we need to:

- Resolve the airport aviation issue and ensure we put in place the new runways required.
- Prepare for the future: The introduction of driverless cars is inevitable and we need to anticipate the impact of this mode of transport relative to existing forms. We must therefore develop a transport strategy that combines mass transit with electric and driverless vehicles to ensure our infrastructure is prepared for future innovation.

Long-term solutions

In the long term we must:

- Consider and action infrastructure finance through Value Capture and learn from other past examples of success not only in the UK but from Europe and the US.
- Consider the sharing of knowledge with other Government deliverers and customers throughout Europe and the US. This needs greater emphasis.
- Develop best practice. From a BAM perspective, our nine other international Group companies give a huge depth of learning and best practice which can be shared with others to drive continual improvement in the UK's infrastructure. This needs to be captured to benefit business practices
- Joining together of regulators, especially in the South East, but also across the country, in a forum to give traction and commonality of thinking would provide increased best practice and value savings
- Respond to future plans. The London 2050 Infrastructure Plan includes a wider audience such as Manchester and the outlying regions. This needs positive collaboration and leadership.
- More Mayoral control would bring benefits as it has to date in London – especially in the housing and asset support sectors

Finally, the use of land in the London area and regions needs some firm leadership and direction to spur development and investment. A Mayoral lead in this, again, would be benefit, reducing the negativity realised from Local Authorities.

Opportunities to increase benefits of Crossrail 2

An option for London to consider is whether to build a new metro system, supporting the existing one and complementing the connections that already exist.

CRL1 and 2 would be part of this but further long-term new systems will need to be planned if the growth becomes the 10m as predicted.

On Crossrail 2 we need to be certain of the problem that is to be solved before deciding on the solution. An agreement on what to spend and what must be done to solve the problem should occur before collaborating to achieve the outcomes.

Initial arrangements must be made that meet the budget before any decisions are made on which project to build. Issues such as station locations, tunnel alignment and conservative settlement criteria all have disproportionate cost impacts. These elements need thorough and open discussion with all stakeholders.

Options for the funding, financing and delivery of large-scale transport infrastructure improvements in London

High Speed 2 (HS2) – using Euston not Old Oak Common

Other issues in the London sector are the immediate provision and development of Old Oak Common with the investment and expansion that will follow using the Greenwich and King's Cross models. Simultaneously, HS2 must enter central London at Euston and the development of this facility needs urgent and immediate commitment. Old Oak Common as a terminal to HS2 is not a solution, however,

Euston certainly is. Connectivity to HS2 from Heathrow and other potential outlying areas including Crewe requires immediate commitment and collaboration between all stakeholders in order to make HS2 successful.

Lessons learned which can be applied to London

Sharing knowledge and information is crucial to long-term improvements – building on the success of the Olympic and TfL delivery models.

It is essential to learn from our previous experience and move away from employing the services of advisers with no real incentives. We must also move away from the use of bespoke contracts when we can make positive use of past success such as the Olympic Delivery model and programmes employed by TfL especially in the streets section.

Using Building Information Modelling (BIM) to streamline delivery programmes

The entire 'Process of Delivery' of projects and all 'Programmes of Work' need considering so that construction is fully considered through from procurement to maintenance using BIM to its fullest capacity. We need to discover efficiency of procurement, construction and long-term maintenance that delivers value to customers.

BRITISH PROPERTY FEDERATION RESPONSE TO NATIONAL INFRASTRUCTURE COMMISSION

The BPF represents companies owning, managing and investing in commercial real estate. This includes a broad range of businesses comprising commercial property owners and developers, financial institutions and pension funds, corporate landlords and residential landlords, as well as all those professions that support the industry.

Introduction

1. We welcome the opportunity to respond to the National Infrastructure Commission's call for evidence. Commercial real estate is a key component of the UK's infrastructure, providing the homes, offices, health premises and distribution networks we need for the country to thrive. Infrastructure is crucial to attracting the investment needed to regenerate the UK's town and cities, and the establishment of the Commission is a welcome step in ensuring swift, coordinated decisions over important projects which will ensure clarity and certainty for investors, business communities and local residents.
2. The BPF has a wide range of members with diverse property and development interests across the country. We have therefore kept our response to high level points rather than recommending individual projects or schemes be prioritised.

London's transport infrastructure

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

3. London is in a remarkable period of growth, with its population topping 8.6m earlier this year – the highest since its 1939 peak. With this projected to reach 11m by 2050, there will be unprecedented pressure on existing infrastructure. The required infrastructure spend for the capital has been estimated at £1.3 trillion to 2050¹, and finding the necessary funding will present a huge challenge.

Housing

4. The availability and affordability of housing likewise poses a major challenge to London and its inhabitants, and this will continue and potentially worsen with predicted population growth. This will affect a wide range of people, from students to the elderly population. The capital has in recent times led the way in recognising the opportunities to add to housing supply by providing different models of housing and a variety of tenures, and this is warmly welcomed.
5. For example, the Build to Rent sector has taken time to reach a critical mass but is making good progress at adding to housing supply with 7,000 units in the London development pipeline. Whilst central Government has been very supportive in reshaping planning guidance to reflect this new phenomenon of pension fund investment in large-scale rental housing, it has taken time to inform and educate local authority planning officers and politicians about this sector and we would urge all involved to recognise the benefits of attracting investment to areas in this way.
6. There is also an excellent opportunity to plan housing delivery in London hand-in-hand with infrastructure. For example, land freed-up by Network Rail and Transport for London (TfL) is proving attractive for build-to-

¹ 'The Cost of London's Long-Term Infrastructure' Arup, July 2014

BRITISH PROPERTY FEDERATION RESPONSE TO NATIONAL INFRASTRUCTURE COMMISSION

rent development, providing high density quality rental accommodation, near to transport modes, for key workers and other employees. TfL have gone so far as to look at Joint Ventures that will allow them to be part-owners of build-to-rent schemes, and therefore generate income to help fund their other work.

Health services

7. With a rising population, the strain on the city's health services will become increasingly apparent. Already nearly two thirds of London's general practices perform worse than the England average in terms of overall patient satisfaction; three quarters are in need of rebuild or repair; and a third is not compliant with the Disability Discrimination Act². There is a significant amount of private capital available from investors ready to work with the public sector to invest in new premises, but this will require long-term strategic thinking from Clinical Commissioning Groups (CCGs) which are only beginning to adjust to their new roles, and a commitment from Government to increase the revenue funding to allow for improved GP premises.
8. London is likely to face care-related challenges presented by the ageing population over the next twenty years. While the average population of London is younger than the national average, the number of people aged over 65 is set to nearly double by 2029³. Given that there is currently only 28 care beds per 1,000 people aged over 65 in the Greater London area and only 1 bed per 1,000 people aged over 65 in the development pipeline⁴, coupled with the fact that people will on average spend two and a half years of their lives in a care home, this is likely to lead to a severe shortage of suitable residential care homes for the city's population.

Town centres

9. As is the case across the country, the role of London's town centres has changed in recent years. There has been a restructuring of retail habits with online shopping becoming increasingly popular; and in some areas there is a surplus or the wrong type of office space.
10. Rather than allowing high streets to fall into decline, there are opportunities to develop residential growth on high streets; to create affordable and flexible new workplaces (for example through the use of pop-ups); and to ensure visiting town centres becomes a positive and attractive experience. Indeed, some London boroughs are already taking these opportunities and we would encourage the Commission to take into account these examples⁵.

What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

11. Land assembly remains a key challenge in the delivery of these projects, as ownership is often disparate. With much of the land in the hands of local authorities and other public sector bodies such as TfL or Network Rail, they have a key role to play in delivery. Structures such as Development Corporations have proved successful in bringing together land and the key players to coordinate processes. For example, 70% of the land involved in the Old Oak Common HS2 and Crossrail station scheme is in the ownership of public sector bodies and is being brought together in the Old Oak Common Park Royal Development Corporation.

³ 'Population Growth and Ageing' London Medicine & Healthcare, 2013

⁴ 'UK Healthcare Development Opportunities 2015' Knight Frank, December 2015

⁵ 'Building on Success – London's Town Centres' London Councils, 2015

BRITISH PROPERTY FEDERATION RESPONSE TO NATIONAL INFRASTRUCTURE COMMISSION

12. Some of the most innovative delivery we see is where our members work in partnership with local government through joint ventures and other structures, where public land is invested as part of the partnership arrangement. These can offer local councils valuable income from, and ongoing controls of their public land rather than outright sale to the highest bidder for that land. But many councils remain nervous of best value rules and we believe there needs to be clearer guidance on what is allowed.

- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

13. London in particular has funded the delivery of schemes through a tax on commercial real estate, with Crossrail partly funded by a business rates supplement introduced in 2010, s106 obligations and by the mayoral Community Infrastructure Levy introduced in 2012. Mechanisms such as these can be useful, but have an impact on the viability of schemes and we would be concerned that solely focusing on them and under-utilising innovative mechanisms such as Tax Increment Financing (TIF) would stall delivery.

14. TIF allows local authorities to borrow against future business rates and reinvest this back into local regeneration schemes. TIF-style models have been utilised with great success across the country, such as to partly finance the Nine Elms extension of the Northern Line to Battersea Power Station Nine Elms extension of the Northern Line to Battersea Power station, and in Birmingham's Enterprise Zone on the Paradise Circus scheme, and there are lessons to be learnt from its application in these examples. We would welcome further discussions with the Commission on these examples.

15. The London Finance Commission Report 'Raising the Capital' included a number of comprehensive proposals on this, many of which could be revisited and would allow growth to be further unlocked.

16. We would be pleased to further discuss or amplify any points raised in our response.

Dear Lord Adonis

Call for evidence

I am writing to you on behalf of the Broxbourne Borough Council in response to your recent call for evidence published in November 2015.

Firstly, I would like to thank you for the opportunity to engage in this critical conversation regarding the future growth and prosperity of the nation. Broxbourne is an ambitious Borough that has significant plans for improving prosperity for residents and businesses and, to this end, we are very keen to work with the NIC to turn our ambition into reality. Ambition Broxbourne is the Borough's economic development strategy and mantra that drives partnership working to secure inward investment, nurture business growth, generate quality places and ensure that residents and workers have the skills the economy needs to thrive now and in the future.

Broxbourne Borough Council is a member of both the West Anglia Routes Group (WARG) and the London Stansted Cambridge Consortium, which are associations of public and private sector organisations from along the routes running from Liverpool Street and Stratford through north London into Essex, Hertfordshire and Cambridgeshire. These organisations are working together to promote economic growth including securing timely infrastructure investments. The Council is also represented in the West Anglia Taskforce Working Group. The West Anglia Taskforce will compile an evidence base to support rail infrastructure investment along the London Stansted Cambridge corridor and will report its initial findings to the Government in the summer of 2016.

The Council is currently developing its Local Plan which will set out how Broxbourne will grow and develop to become a more desirable and prosperous place to live, work and visit. It will be a development strategy for the next 15 years. The Plan will provide for homes, jobs, shops, transport and infrastructure - all set alongside the long term protection and improvement of our Green Belt, parks, open spaces and built heritage. An extensive evidence base underpins the preparation of the Local Plan. This has resulted in a detailed assessment of the levels of need within the Borough, counterbalanced against the capacity of the Borough to accommodate growth.

The Borough Council strongly supports the current Crossrail 2 proposals as part of Ambition Broxbourne. In particular, we recognise the critical role it will play in driving local and strategic economic growth and prosperity over the coming years, thereby ensuring that the economy remains competitive and able to nurture and sustain healthy and productive communities. This support has also been confirmed by the Ambition Broxbourne Economic Development Board; a cross sector grouping overseeing and driving the economic development plans for the Borough.

Broxbourne Council is a strong supporter of the regional route of Crossrail 2 because it will add capacity across the network, relieve pressure on key lines, and improve connectivity into and through London, whilst also supporting growth in jobs and homes and regeneration along the London Stansted Cambridge corridor. The Council also strongly supports the proposed provision for four tracking of all or part of the line between Tottenham Hale and Broxbourne to accommodate increasing demand for local services which would bring many benefits and opportunities to the Borough's residents and businesses.

In particular the Council has written separately to the Crossrail 2 team requesting an early opportunity to discuss any available designs in more detail with regard to:

- Broxbourne's ambition of having a new railway station in Turnford between Cheshunt and Broxbourne to support the creation of a new Borough Centre at Brookfield;
- Better connectivity between key strategic development sites and the existing and proposed railway infrastructure including, for example, the proposed commercial development at Park Plaza and the Southbury Loop railway line;
- Programme of level crossing closures;
- Details of stable location near Broxbourne;
- Future of brick bridge over the railway near to Broxbourne Railway Station;
- Proposals for upgrading Waltham Cross, Cheshunt and Broxbourne stations;
- The possibility of developing a more permanent arrangement/local project office to facilitate closer joint working; and
- Financial programming of Crossrail 2

In addition, there is a need for significant improvements to the A10 in supporting growth in housing and employment especially with regards to the planned expansion of Brookfield (to create a new Borough Centre) and Park Plaza (a significant employment allocation). The initial phase of transport modelling is now complete and it was found that there are many capacity constraints at the following locations:

- A10 Great Cambridge Road/ Church Lane
- A10 Great Cambridge Road/ College Road
- A10 Great Cambridge Road/ A121 Winston Churchill Way/ B198 Lieutenant Ellis Way
- M25 J25/ A10 Great Cambridge Road
- A10 Great Cambridge Road/ A1055 Bullsmoor Lane

Further transport modelling is underway to provide more detail and help develop proposals to remedy these issues. Investment in the A10 will also support current planned investment in junction 25 of the M25, help address congestion issues in Enfield, support growth further

north along the A10 corridor in East Hertfordshire District and improve connectivity with Cambridge (with regards to growth in the Life Sciences sector) and Stansted Airport. Therefore we consider that it is critical that these issues and associated improvements are recognised and supported through the NIC. The Council would welcome continued engagement with TfL, Network Rail, Highways England, the National Infrastructure Commission and other key stakeholders to ensure that Crossrail 2 and other strategic infrastructure investment can maximise the potential benefits both locally and nationally.

Overleaf is the Council's more specific response to your call for evidence under your published questions but specific to us.

In conclusion, we are an ambitious Borough and strongly believe that, like other areas within London's hinterland, we play a critical role in its success and have a vital role to play in London's future to ensure it remains a global core city generating and driving national and international economic prosperity. We would be more than happy to host a meeting of the Commission to spotlight how key investments, such as Crossrail 2, will unlock the potential of Broxbourne for the benefit of London and the nation.

If you require further information, or wish to discuss any of the feedback, then please contact Alf Cuffaro on 01992 785539 / alf.cuffaro@broxbourne.gov.uk.

Yours sincerely

[signature redacted]

Greg Macdonald
Director of Community and Economic Development

1. What are the major economic and social challenges facing the Borough of Broxbourne over the next two to three decades?

Housing

The Council has assessed a need for 419 new homes per annum between 2014 and 2031, a total of 7,123 homes. New homes built between 2014 and 2015 would be discounted off this figure but the total need would be around 2,000 new homes in excess of the provision that the Council was planning to provide for prior to the publication of the Government's 2015 household projections. Prior to these projections having been produced, the Council was already faced with making very difficult choices about Green Belt developments. Nevertheless, further review of the Green Belt and of urban capacity has identified sites that could accommodate approximately 6,000 new homes in total. That is the number of new homes that the Council is currently proposing to consult on within the draft Local Plan. This would increase the number of new homes within Broxbourne from 39,800 (2014) to approximately 46,000 in 2031. 6,000 new homes falls short of the identified need and an option could be to meet the full need for in excess of 7,000 new homes. However, at this stage, the Council believes that to meet the need in full would have an unacceptable impact on the aim and purposes of the Green Belt as well as on the ability of Broxbourne's infrastructure to cope. We consider that the redevelopment of stations along the Crossrail 2 route will provide opportunities to innovate and explore new ways of meeting and exceeding this housing requirement.

Population

The current population of the Borough is approximately 96,500. In 2031, the Government predicts that the population will have increased to 109,100. This will be as a result of natural growth in the resident population and a net increase of people moving into the Borough, primarily from London. The Government's population projection is consistent with the number of new homes that the Council is planning for over the Local Plan period.

Employment

It is not proposed that the allocation of land for employment will follow a "needs" based approach. The Council considers that the proposed employment sites should be promoted to maximise the opportunities to meet the employment objective and to diversify the employment base of the Borough. The protection of existing employment areas and the promotion of new ones align closely with Ambition Broxbourne, the Council's economic development strategy, and with the Strategic Economic Plan of the Hertfordshire Local Enterprise Partnership. It is estimated that the new employment opportunities identified to date would result in approximately 7,500 new jobs being created within the Local Plan period. There is a tension between housing and employment growth that we are currently reviewing through the Local Plan with the potential release of strategic sites within the greenbelt.

Shopping and Leisure

The Council has a long standing ambition to reduce the unsustainable leakage of retail expenditure outside the Borough and to provide its residents with better access to high quality shops. The Council's retail needs assessment identifies capacity for between 9,400 m² net and 13,200 m² net new convenience goods floorspace to 2030. It also identifies capacity for between 25,000 m² and 45,000 m² net new comparison goods floorspace to 2030. The proposal for a new Borough Centre at Brookfield will provide additional space.

Schools

Hertfordshire County Council has identified a need for significantly more primary and secondary school floorspace to be provided by 2031. The potential to expand existing schools has been fully assessed and there still remains a need for one new secondary school and up to eight new primary schools within the Local Plan period.

Health

At this stage, a need for two new/extended health care facilities within the Local Plan period has been identified and it is intended that provision will be made accordingly

Green Belt Releases

Urban and brownfield sites cannot meet all of the development and infrastructure needs and provide for sufficient opportunities for the future development of the borough. The nature and location of town centres and railway stations limit the scope for significant additional development in and around such locations without major redevelopment that is not considered practicable or desirable within the lifetime of this Local Plan. Intensification of existing residential areas would adversely impact on the suburban character of much of the Borough and would not provide the means to ensure the delivery of appropriate infrastructure to support development. The potential to reuse employment land for housing is limited given the Council's aspirations and objectives to promote economic growth and development. Alternative options have been carefully considered and in Broxbourne the Council has concluded that planning for the Borough's development needs can only be achieved through the strategic release of some Green Belt land.

Broxbourne currently has some 3,300 Hectares of Metropolitan Green Belt. The Council has prepared a Strategic Green Belt Review that divides the borough into eleven broad areas and looks at how these areas perform in terms of the aim and purposes of the Green Belt. This assessment has highlighted five broad areas that have very limited scope to accommodate development but also identifies six areas that have warranted further consideration in terms of their ability and capacity to accommodate additional development and associated infrastructure. These areas are: the lands between Hoddesdon and the A10; Brookfield and Cheshunt Park; Goffs Oak and Rosedale; Bury Green; the southern A10 Corridor; and lands between Wormley and the A10.

Examination of these areas has resulted in proposals being made to allocate lands to facilitate a number of strategic and edge of urban developments.

Town Centres and the Retail Hierarchy

The borough's town centres remain the hub of community life and their regeneration and improvement are priorities for the Council.

The Hoddesdon Town Centre Strategy was published in 2010 and has been the framework for the redevelopment of the Tower Centre and a range of development, improvement and promotional projects over the last five years. Successive annual actions plans have rolled forward those projects and a full review of the strategy is now proposed. It is anticipated that the following will form the basis of that strategy:

- Further public realm improvements in the High Street and beyond;
- The promotion of small, scale mixed use development sites;
- A gateway development into the town centre at and around Scania House;
- The provision of a mix of day and evening activities;
- Improved access; and
- Protection and enhancement of historic character.

The Waltham Cross Town Centre Strategy was published earlier in 2015. The key projects to be promoted through the Local Plan are:

- Redevelopment of the northern High Street for a mixed use residential and retail development. This would involve the relocation of Homebase and Wickes to Park Plaza North;
- Improved vehicle access through the northern High Street and a range of public realm improvements throughout the High Street and beyond;
- Additional homes in and around the town centre;

Retail Opportunities and the Retail Hierarchy

Opportunities for major new retail and leisure developments to meet the borough's needs within its existing town centres have been examined. However, the only clear opportunity is through the redevelopment of the northern High Street in Waltham Cross. To date, the site has received very limited interest from retailers to the extent that the Town Centre Strategy now proposes a mixed use approach with more limited retail content, an approach that will be reflected in the Local Plan. The only major opportunity for significant new retailing in the borough is at Brookfield. Given the increased retail content and the mix of uses proposed at Brookfield, the Local Plan will include a retail hierarchy that places Brookfield on the same level as Hoddesdon and Waltham Cross town centres. Floorspace levels and content of the centre will, however, be strictly controlled to ensure that it complements the borough's existing centres. Cheshunt Old Pond will remain as a District Centre and a range of neighbourhood and local centres will also be identified within the hierarchy.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in the Borough of Broxbourne - on road, and rail including, but not limited to Crossrail 2?

Transport Infrastructure

The Council is aware that new development will add more pressure to roads and rail services. The only significant new road planned within the Local Plan will be a new link from the existing Brookfield Centre to the Turnford Interchange on the A10. The emphasis will therefore be on managing traffic growth, improving the existing highway network - with a particular focus on the A10 - and on enabling local people to use alternative forms of transport. The Council is particularly supportive of proposals to 4-track the West Anglia mainline and to deliver Crossrail 2 into the Borough to increase rail capacity. As a result the Local Plan is proposing and supporting a range of transport projects as follows:

Road

- Additional junction capacity at the M25 junction 25 through the provision of new on and off slip-roads;
- Improvements to traffic flow through the A10 roundabout linking Lieutenant Ellis Way and Winston Churchill Way;
- The consideration of additional lanes on the A10, as far as possible within the confines of the highway boundary;
- Improvements to traffic flow through the signalized junctions with the A10 at Church Lane and College Road. The future role of these junctions within the wider road network will be examined;
- The northern extension of Brookfield Lane West from the Brookfield Retail Park to the Turnford Interchange on the A10;
- Improvements to the Sun and Hertford Road roundabouts in Hoddesdon;

Rail

- The implementation of Crossrail 2, a new dedicated rail link from Broxbourne to south London. The Council is currently supporting Broxbourne Station as the northern terminus for the majority of Crossrail 2 services;
- The construction of a new station between Cheshunt and Broxbourne at Turnford to support the creation of a new Borough Centre at Brookfield
- Four tracking of the West Anglia mainline to Stanstead Airport;
- Safeguarding of and continued improvements to stations in the borough - including longer platforms, additional parking and improved access;
- Better connectivity between key strategic development sites and the existing and proposed railway infrastructure including, for example, the proposed commercial development at Park Plaza and the Southbury Loop railway line;
- The extension of Oyster card services;
- The replacement of level crossings with appropriate alternatives.

Bus

- The protection of viable bus services throughout the borough;
- Expansion of Waltham Cross bus station in its current location;
- Creation of a new bus station at Brookfield;
- New bus service between High Leigh, Hoddesdon and Broxbourne Station;
- Reinstated bus service to Park Plaza, Waltham Cross.

Walking and Cycling

- Pedestrian and cycle connection from Park Plaza to Waltham Cross town centre;
- Improvements to the New River path including cycle use;
- Promotion of additional off road footpath and cycle links through the borough and connect to and through new developments;
- Greater access to the countryside for pedestrians, cyclists and horse riders
- Promotion of a walking and cycling strategy

The Council will also support transport projects outside the borough where they will ease congestion and provide additional services to residents and businesses within the borough.

Transport related priorities and potential impact

An efficient transport network for all modes of travel will be critical to unlock the full potential of Crossrail 2. In Broxbourne the main priorities are the delivery of Crossrail 2 and improving the capacity along the A10 and its junctions south of the Turnford interchange. Consideration will need to be given to connecting Crossrail 2 to the A10 and the M25 and associated key development sites and existing and proposed communities. In Waltham Cross this presents a particular challenge/ opportunity given that access from the station to the M25 is very problematic and convoluted even though it sits right next to the motorway; a more direct link solution could also address current congestion issues in Enfield.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Opportunities for increased benefits:

- Extend the northern terminus beyond Broxbourne Station
- Construct a new station between Cheshunt and Broxbourne at Turnford to support the creation of a new Borough Centre at Brookfield. Hertfordshire County Council and Broxbourne Borough Council are working together on a business case for the new station.
- Early delivery of four tracking of the West Anglia mainline north of Tottenham Hale to bring forward by a decade much needed new homes and employment opportunities for the region.
- Better connectivity between key strategic development sites and the existing and proposed railway infrastructure including, for example, the proposed commercial development at Park Plaza and the Southbury Loop railway line;
- Improve access to and reduce congestion around stations and improve links to A10 and M25

Opportunities for reducing costs:

- Comprehensive and regular consultations with all stakeholders, especially the key planning authorities and landowners , at each stage of the project
- Programme of level crossing closures to allow for the four-tracking of the West Anglia Main Line
- Reliable and up to date land surveys

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Possible funding opportunities:

- Recouping some of the uplift on land values from landowners via a Community Infrastructure Level approach
- Private sector contributions (via a form of Business Improvement District type model) as businesses will benefit from having such a major route on their doorstep
- Scope to align the work programme with the investment to make better use of resource and to drive more effective skills development

This needs to be underwritten nationally to create certainty which in itself will facilitate the investment via the mechanism mentioned above

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

Please refer to background paper below under 4)

Useful links to background papers:

- 1) More information regarding Ambition Broxbourne can be accessed at www.ambitionbroxbourne.co.uk
- 2) Broxbourne Local Plan - Please visit <http://www.broxbourne.gov.uk/resident-planning-and-building-planning-policy/development-plan> for more information
- 3) Last year the LSCC published

[*The Strategic Case for Investment in the West Anglia rail route*](#), which sets out:

- a) The huge economic importance of the London-Stansted-Cambridge Corridor;
- b) The large levels of economic and population growth already happening in the corridor;
- c) The role that investment in the West Anglia Line will have in enhancing the labour mobility and economic effectiveness

- 4) Lessons from major rail infrastructure projects

BSA - The Business Services Association

Response to the National Infrastructure Commission Consultation

January 2016

Large-scale transport infrastructure improvements in London

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades.

According to Centre for Cities, between 2004-2013, London's population grew faster than any other of the UK's top ten metropolitan areas¹. The Greater London built-up area is nearly five times larger than the next largest of Greater Manchester. This means London has unique infrastructure pressures.

High house prices, coupled with population growth, will likely see more people move to the outskirts of London in search of cheaper dwellings. This development will necessitate improvements to suburban train lines such as Thameslink, Southern and Chiltern Railways in order to cope with increased demand along with a more positive and ambitious residential and mixed use development at and around local stations (both existing and planned). A limited amount of track space already hinders these often overcrowded services, a difficulty that will be exacerbated by a lack of investment and redevelopment.

This picture of steady, rapid growth means London's already strained transport network will face increasing pressure. Crossrail will add 10% capacity to the capital's rail network, however former TFL Commissioner, Sir Peter Hendy, has previously said that it will be 'immediately full' upon opening. This therefore suggests that a second major rail line is needed across London and the BSA welcomes proposals to explore the construction of Crossrail 2.

As with the first Crossrail, refurbished and increased station infrastructure will be a critical component of the project. Stations should be viewed as centres of their community, providing a basis for growth and development. New and improved stations with stable levels of investment can act as a catalyst for both housing and business development. In London especially, proximity to a train station is often a key consideration for someone looking to buy a home. Similarly easy access to transport links often affects a business' location decision. It is imperative that decision-makers take a whole community view of an individual project when judging its merits.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Crossrail 2, similar to the original Crossrail, offers London an opportunity to add significant capacity to its transport network. As previously mentioned, if Crossrail is full upon opening in 2018, the need for additional capacity will be immediate. The BSA would therefore encourage the development of the Crossrail 2 project as rapidly as is appropriate and necessary. Crossrail 2 will mean the East-West and North-South corridors of London will be served by a high-tech, far reaching and modern rail

¹ <http://www.centreforcities.org/wp-content/uploads/2015/01/15-01-09-Cities-Outlook-2015.pdf>

service. It also creates an opportunity to plan significant new housing above and around many of the proposed new stations which needs to be seen as an integral part of the Crossrail 2 project and not just an afterthought.

Additionally, the Commission should examine closely options for renovating and rebuilding parts of Euston station. As a key hub station, providing access to the North West and Midlands it is already overburdened and in need of investment. Factor in Euston's role as HS2's London hub and proximity to a proposed stop on the Crossrail 2 route and the need to substantially upgrade the station is clear.

Crossrail should not be the only means by which London seeks to expand its intra-city rail service. The capital has already seen new rolling stock introduced on the tube network, such as on the Metropolitan Line, Hammersmith and City Line and Victoria Line in recent years. A number of planned extensions will increase the reach of the tube network, helping create jobs. According to TFL, the Northern Line's Battersea extension will create 24,000 jobs and 18,000 new homes by 2020². The National Infrastructure Commission should explore the possibility of further tube extensions as London continues to grow both in terms of people and square miles. The business case for individual projects and investment, particularly the strategic and economic case, are key to working through prioritisation and economic impact. It is crucial that the business case is cross-agency, able to compare a range of transport and other infrastructure investment.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Starting construction on Crossrail 2 sooner will increase the benefits of job creation and adding capacity. The original Crossrail provides a bountiful source of construction workers, designers and engineers with much needed experience of building a brand new, cross-city, subterranean railway line. Lengthy delays in beginning construction risks this pool of workers dissipating and being committed to alternative projects. Government must offer assurance and clarity as to whether and when Crossrail 2 will be built. As soon as this is offered, businesses can begin the necessary training and upskilling of workers needed to deliver the project.

The BSA urges the government to recognise the benefits of allowing for a seamless transition between major infrastructure projects. Crossrail and Crossrail 2 are an obvious example, being in the same geographical location, requiring the same equipment and demanding the same skills. The National Infrastructure Plan for Skills estimates a shortfall of nearly 400,000 construction and engineering jobs by 2020³. A lack of seamless transition between projects will exacerbate the problem.

The option of phased implementation should be looked at, which could mean that some of the Crossrail 2 infrastructure is not only built, but in operation ahead of 2028. This could allow for increasing London's transport capacity gradually and earlier than if the line was opened all at once. Particular attention should also be paid to development at key nodal points, where a number of major train lines will meet. This in turn should create 'spin-off' regeneration opportunities for housing and businesses to develop in these nodal points where they otherwise wouldn't have.

³ https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/464354/NIP_for_skills_final_web.pdf

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Tax Increment Financing (TIF) offers a particularly beneficial structure for funding large-scale transport infrastructure improvements in the capital. This is due to the relatively high-concentration of businesses, particularly around Central London. TIF works by dedicating a proportion of future tax revenues (normally business rates in the case of the UK) for infrastructure and development. The improved connectivity derived from such projects would usually see an increase in business rate revenue, providing a viable option for funding large-scale transport infrastructure. However, given that councils will soon be allowed to keep a portion of their business rate revenues, it will require coordination across all of London's boroughs.

In addition, opportunities for significant residential development at and around new stations and transport interchanges creates an opportunity to secure a mix of capital receipts and new revenue streams to support new transport investment.

As raised in the 2015 Autumn Statement and Spending Review, the pooling of local government pensions funds offers a potentially significant source of funding for infrastructure investment. Pooling the pension funds of London's local authorities, as well as possibly including other bodies such as Transport for London, will allow a greater single pot of investment. Pension funds have the advantage of being able to invest in projects which look longer-term. Infrastructure investment is ideal for pension funds as it offers very low risk due to being underwritten by the government and delivering steady, long-term returns.

In order to support the effective delivery of large-scale transport infrastructure, it is important that an ambitious but realistic time-frame for completion is put in place. A recent National Audit Office report said a project with lengthy timescales negatively affect the continuity, whilst short timescales can make delivery a virtual impossibility⁴.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied?

BSA members have experience of constructing major infrastructure projects across the globe, including, but not limited to, Canada, U.S.A. and Dubai. As with the UK, stability is key to the success of any infrastructure programme, with constructors reliant on the assurance that long-term projects will remain funded and immune from sudden changes or cancellations.

Singapore and Hong-Kong, as major, densely packed metropolises with high demand for transport infrastructure have taken the approach of 'upwards not outwards'. Given the limits on space that exist in both cities, particularly Hong-Kong, projects are being proposed and implemented that will see transport systems make use of space above the city rather than spreading outwards.

LONDON'S TRANSPORT INFRASTRUCTURE

RESPONSE TO NIC CALL FOR EVIDENCE

JANUARY 2016

BuroHappold Engineering Response to NIC call for evidence

Large-scale transport infrastructure improvements in London

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Accommodating London's growth in order to maintain its competitive position as a leading global city is probably the greatest challenge faced today by London – both from an economic as well as a social perspective. It will require the provision of a far greater quantity of housing that is affordable to 'normal' employees whilst, at the same time, being readily accessible to jobs. Studies have highlighted that around 50,000 new homes per annum will have to be built to meet London's needs, year on year for the next 20 years. Although there are substantial **public sector assets** in London, and a programme of rationalisation is underway to release surplus assets for other uses and in particular housing, public sector budget constraints mean that central and local government departments and other public sector bodies are being directed to gain the full market value from any sales. This immediately constrains the opportunity to provide homes that are affordable.

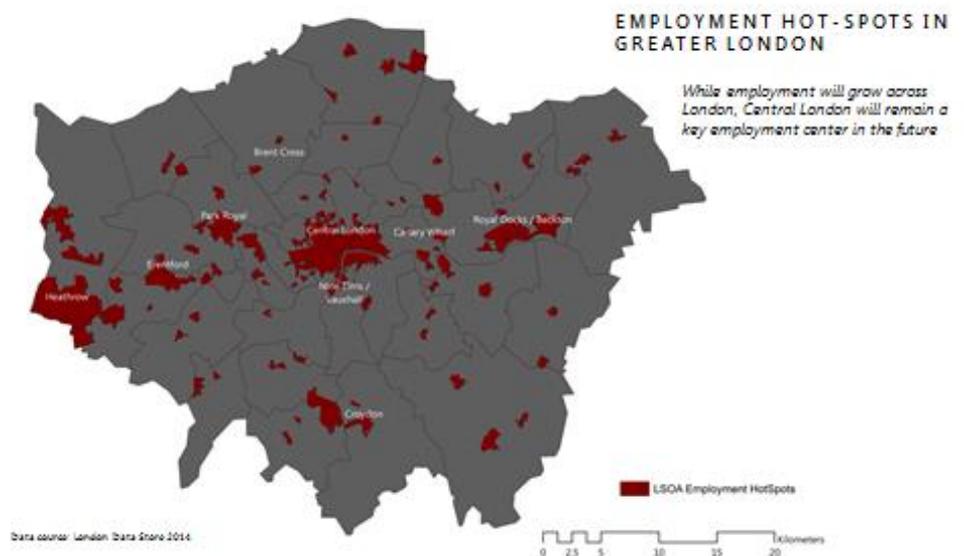

Many organisations based in the capital are struggling to attract and retain quality staff, driving wage inflation and reducing the competitiveness of London for employers. One of the key **Quality of Life** indices against which cities are measured is the ability to reach the workplace within 30 minutes of leaving home. London has numerous acknowledged attractions, including a thriving and dynamic employment 'engine' and many accept a daily commute of an hour or more. However, increasing accommodation costs and overcrowding and congestion on the transport network threaten to tip the balance in favour of other cities as more attractive places to live and work.

The historical 'terminus' model of London's Victorian railway network adds to the challenges of the capital, with rail services decanting huge numbers of rush hour passengers onto London's transport network, and London Underground in particular. The lack of cross-London lines removes the option of direct inter-regional or international rail services, forcing passengers to change modes at packed terminus stations, significantly lengthening travel times and negatively impacting the quality of life for many.

Crossrail will make a significant difference to East-West mobility across London from Essex to the Thames Valley when it opens in 2018. It will improve accessibility to a number of key employment 'hotspots'. However it is predicted that by 2030 it will be close to capacity, and additional rail capacity of this nature will be needed.

Employment Hotspots

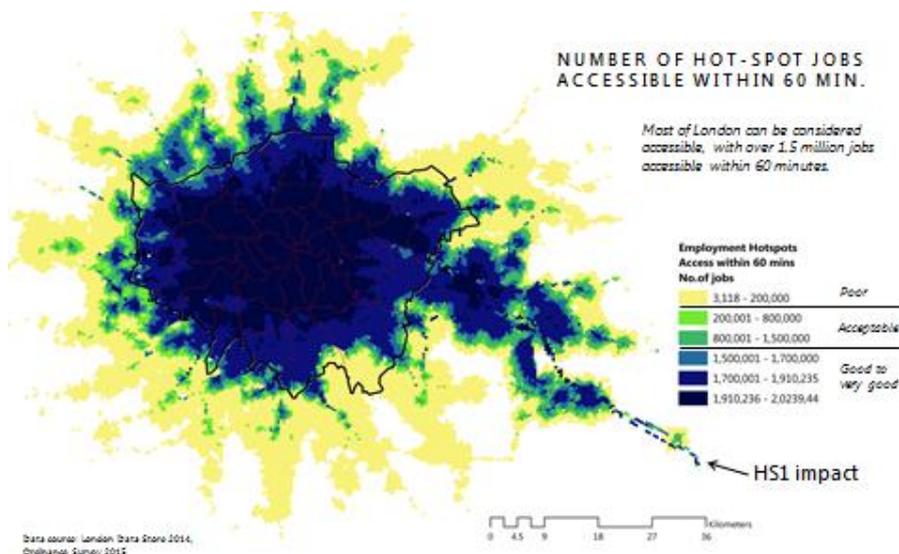

Unlike other cities, employment in London is concentrated in a relatively small number of areas. At BuroHappold, we have modelled these 'Hotspots' and planned developments (for example the area around Old Oak Common where around 65,000 jobs is forecast to be created by proposed development around a new Crossrail and HS2 station).

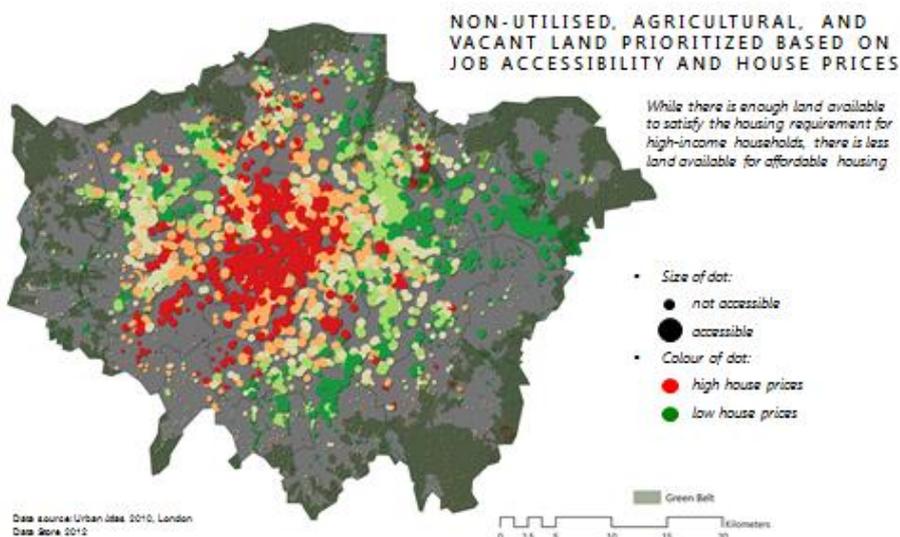

Accessibility to Employment

Current transport accessibility to London employment areas could be considered good for much of the capital, with most areas reachable by current and planned transport infrastructure within 60 minutes.

It should be noted on the diagram adjacent how HS1 and the Javelin services from Kent have had a strong impact on extending job accessibility.

Land Availability

London has a good supply of non-utilised, vacant and agricultural land that could be made available for housing. Much of it is blessed with reasonable (existing or planned) transport connectivity to employment.

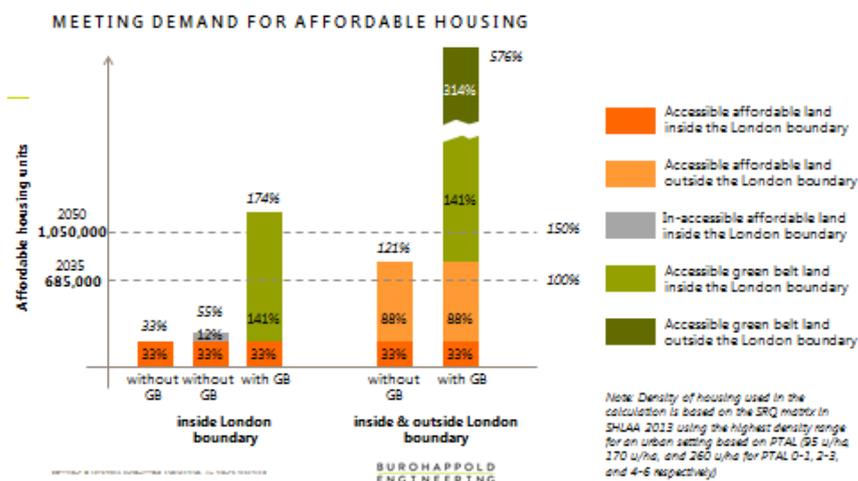

However, high land prices, particularly of sites close to the centre of the city, excludes many of these areas from being suitable for the development of housing that is affordable for those on anything other than

very high salaries or with significant funds to invest.

Meeting the Demand for Affordable Housing

Our modelling has identified the areas that are available for development, accessible to jobs via current and planned transport infrastructure (including Crossrail), and (crucially) affordable.

However, even if fully developed, this land will only meet 33% of the forecast needs for 2035. [NB Our calculations are based on the SRQ matrix in SHLAA 2013, using the highest density range for an urban setting].

Consequently, other options need to be considered if London's competitiveness and position as an economic powerhouse is not going to be compromised.

Examining other parcels of land within the London boundary, a further 12% of needs could be met - if they could be made more accessible to employment by improvements to the transport network.

We have also identified accessible affordable land outside London's boundary that, if made available for homes, could meet the housing needs of the City for the next 20 years. Looking further ahead to 2050, one could consider the transfer of a small amount of accessible greenbelt land for housing needs and this would enable London to accommodate, in an affordable fashion, all of its forecast population demands.

Although releasing greenbelt land is considered a tough political step to take, we believe it could be mitigated by creating equal or greater areas of amenity land within the London boundary (and elsewhere). This could be achieved either by remediating challenging brown-field sites or utilising sites which are likely to remain inaccessible through lack of good transport connectivity.

In summary, we see two key areas to focus on in order for London to continue as a world-leading city, namely:

1. Improvements to transport infrastructure particular linking affordable, available land with employment areas
2. Some future use of green belt land already accessible to major transport routes from central London, mitigated by land swaps to maintain areas of amenity.

We see Crossrail 2 and Cross City Connect – see later – falling into the first category.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2?

BuroHappold Engineering has invested significant time and resources to the examination of infrastructure improvements for London in two key areas:

1. An alternative to the London end of HS2 that will deliver much greater benefit, in terms of inter-regional connectivity, economic regeneration, vital additional capacity and network resilience, whilst requiring **no additional investment cost** than that forecast for the full delivery of the current terminus at Euston.
2. The use of low level bridges to unlock key development sites in East London – with particular emphasis on the priority development area known as 'City in the East'

A. Cross City Connect

The current proposals for linking the planned HS2 rail route into London represent a missed opportunity. This could be the foundation of an effective and integrated modern railway network for the UK. What's more, the proposed terminus station development at Euston not only delivers poor economic returns, but will become ever-more costly and difficult to deliver.

Working with tunnelling experts OTB, BuroHappold Engineering is promoting an alternative route which links with HS2 in the west of London, crosses the city in tunnel and links with HS1 in the east of London. Our Cross City Connect proposal has a single major rail interchange at Waterloo/ Southwark/ Blackfriars with substantially better onward connections into London as well as providing seamless access to Europe.

We have sought to address all of the major issues facing the current proposals for the HS2 terminus at Euston, and fulfil the original intent of HS2 project.

It is important that HS2 hits its ambitious timetable. With the right level of support and decisive commitment, it will be possible to deliver Cross City Connect by 2026 – the current timetable for the partial terminal at Euston promoted by HS2 Ltd. It is certainly possible to deliver the full scheme in advance of HS2 Phase 2 in 2033. From a timing standpoint, this will also enable additional demand to be met at a point when the current Crossrail route nears capacity.

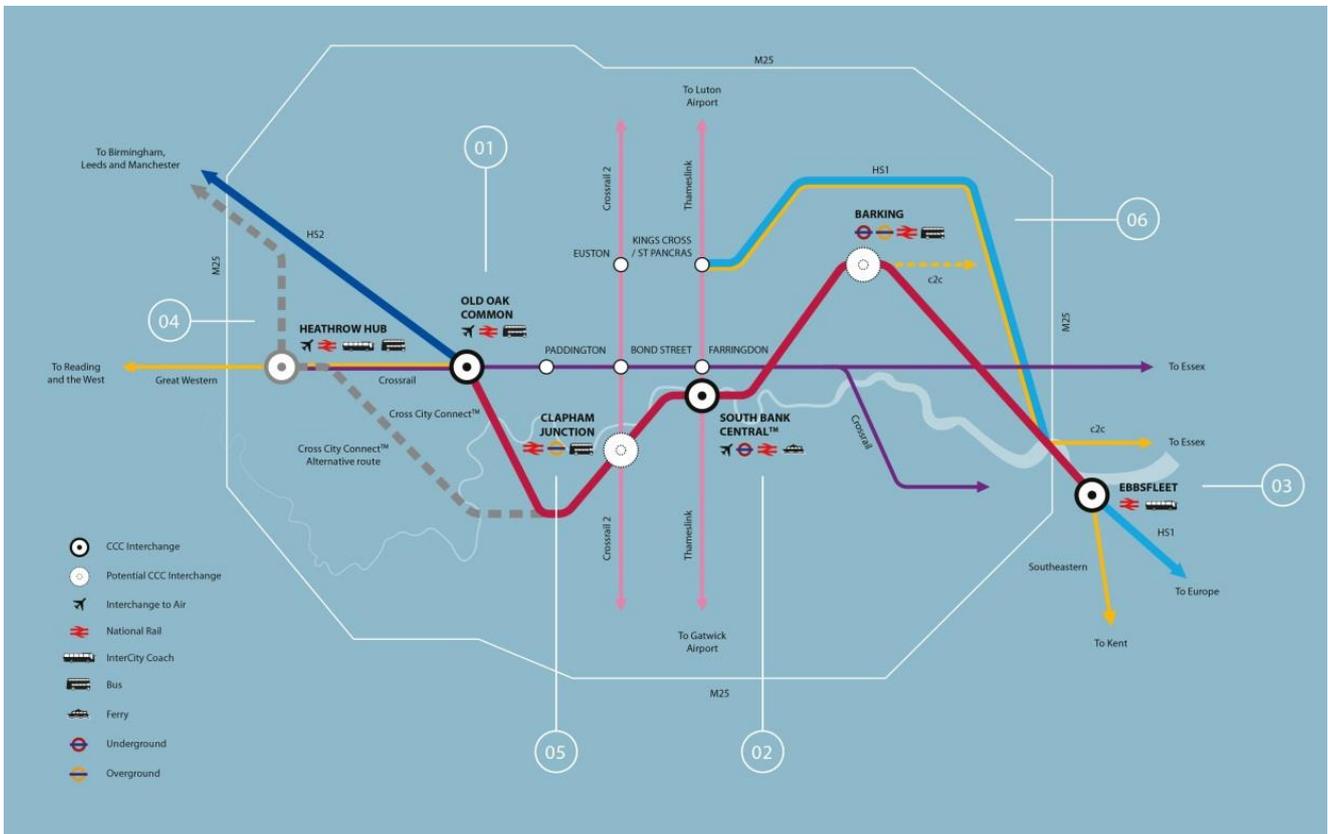

Euston HS2 major issues:

- **Delivery challenges:** Euston requires a massive land-take on a constrained and complex operational site. Adding eleven new HS2 platforms to the challenges of upgrading the underground station, delivering Crossrail 2, and regenerating the local area is a step too far.
- **Spiralling costs:** Land acquisition and construction estimates for the completion of the Euston terminal, from various sources, has risen from the original budget of £1bn to between £4bn and £7bn. Even the current partial build-out proposals tabled are acknowledged to cost well over £2bn –without including the costs of land acquisition nor the work required by others to complete the build-out.
- **London disruption:** Over two decades of misery for those living and working around the area and for commuters using the regional line into the existing station.
- **Connectivity:** Key link to HS1 has been dropped – removing the direct international link and also inter-regional connectivity.
- **Wasted regeneration boost:** To counter rising costs, significant over-site development is planned. Yet Euston is already benefitting from the regeneration around Kings Cross and may gain the benefit of a future Crossrail 2 station. The incremental value delivered by HS2 will be marginal.

The Cross City Connect Solution

We have taken a fresh look at some of the original aims of the HS2 project and drawn on our international experience and upon best-practice in urban infrastructure. Our solution, Cross City Connect (CCC), traverses London in tunnel construction from a link with HS2 in the West to Ebbsfleet Station in the East. It links directly to Europe via HS1, and connects regional services from Essex and Kent to the Thames Valley, the West, Midlands and the North. There will be a new central London hub on the South Bank beneath and between Waterloo and Southwark. It has the capacity to include additional interchanges to enhance regional connectivity and unlock much-needed growth areas.

Working closely with tunnelling specialists OTB, we have defined a route that is **deliverable for no more than the cost of the full delivery of Euston, within current HS2 programme timeframes.**

01 Western Hub - OLD OAK COMMON Option

Our proposal sees Old Oak Common become the western station for the CCC underground rail route.

- Key London HS2 station with connections to Crossrail and Great Western Mainline.
- Further boost to the area's massive regeneration potential
- The opportunity to create an interim terminus for HS2 Phase 1, allowing time for the delivery of a better solution ahead of Phase 2.
- Options to provide additional connectivity to the Bakerloo Line and to overground services at Willesden Junction. (See later section for more information)

02 Central London Interchange - SOUTH BANK CENTRAL™

A new central station that sits beneath and between four existing stations in the heart of London. Initial investigations demonstrate that this is a viable and economically beneficial option.

- Significant benefits in terms of connectivity, network capacity and resilience.
- Provides walking access to Central London.
- Links to 5 underground lines, Thameslink and overground services to the southeast and southwest.
- More efficient dispersal at Waterloo, Southwark / Blackfriars.
- Regeneration boost to the South Bank, and to the Elephant & Castle and Vauxhall Nine Elms opportunity areas.

03 Eastern Hub - EBBSFLEET

Coming to the surface near Rainham, where there is space to service and turn around trains, our route travels to the existing HS1 station at Ebbsfleet as a gateway to both international and inter-regional services.

- Connection to existing HS1 services to Europe.
- Inter-regional trains linking the Thames Valley and the West to Kent (Javelin) and Essex (c2c).
- Boost to the embryonic Ebbsfleet Garden City.
- Ease of access to M25 and other regional motorways.

04-06 Potential CCC Interchanges

Cross City Connect has been designed to enable significant future connectivity and regeneration to be delivered cost-effectively:

- **West London linkage option at HEATHROW HUB:** Depending on the final decision on the location of the future southeast airport, there is also an option to link directly to a new transport hub and employment site at Heathrow. Heathrow Hub could provide a direct rail link to this major international gateway for the south-west, midlands, north and south-east via HS2, GWML, Crossrail and Cross City Connect, as well as easy access from the motorway network. This also has the advantage of space that is more easily developable than Old Oak Common, whose ambitious development plans are complicated by the large amount of live rail infrastructure, including the construction of a new Crossrail Depot.
- **CLAPHAM JUNCTION:** There is the option for an interchange with Crossrail 2 and the many overground services to South London and beyond.
- **BARKING:** There is the potential for a future station to provide impetus to The City in the East area to support London's projected growth.

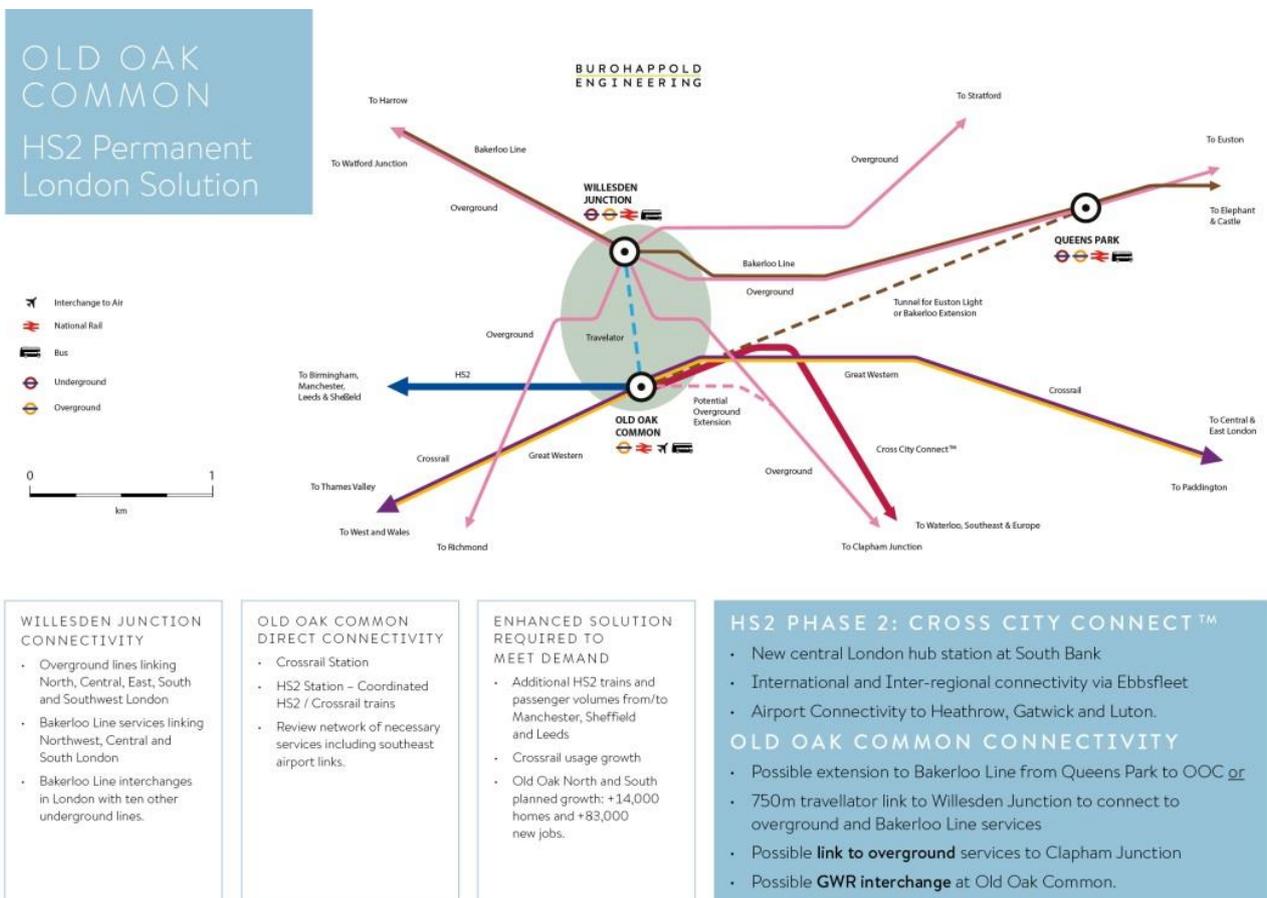

MEETING HS2 PROGRAMME TARGETS

It is important that HS2 hits its ambitious programme milestones. We are advocating a two-phase solution, that aligns exactly with the HS2 programme with an interim terminus at Old Oak Common for HS2 Phase1, with the full Cross City Connect route open in time ahead of the opening of HS2 Phase 2 in 2033.

A Temporary Terminus at Old Oak Common

Old Oak Common presents a viable *interim* solution for the first phase of HS2:

- HS2 passengers transfer to a waiting Crossrail train for onward transfer to central and eastern London. Passengers can also travel west on Crossrail to Heathrow and the Thames Valley
- Turnaround of HS2 trains using the six HS2 platforms, supplemented by the first section of the CCC tunnel
- Options for increased connectivity via a traveller link to Willesden Junction, or an extension to the Bakerloo Line at Queens Park

Why Old Oak Common won't work as a permanent HS2 Terminus

By the opening of HS2 Phase 2, a new solution will be required to cope with significant additional volumes:

- HS2 passengers travelling to and from Manchester, Sheffield and Leeds.
- Crossrail will experience increased usage from residential and job growth along its route.
- The development of Old Oak Common North and South is predicted to add up to 14,000 homes and bring 80,000 jobs to the area.
- London's population is forecast to increase by close to 2 million additional residents by 2030.

By 2030, Cross City Connect will be ready to carry passengers to its central London interchange and on to Ebbsfleet with connection to HS1 and regional services to Essex and Kent.

Potential impact of Cross City Connect on employment, productivity and housing supply in London and the southeast?

Connectivity, capacity and resilience:

- Greater UK **regional connectivity**, from the northwest, northeast and Midlands to London, and to the southeast and southwest, slashing travel times and giving direct access to new markets.
- **Reduced traffic** volumes on the M25 and the wider southeast motorway network, increasing the efficiency of many business trips and commercial logistics.
- Broader and more **efficient dispersal** at Waterloo / Southwark / Blackfriars with more **effective access** to other services.
- **Reduced pressure on Crossrail** long term via our additional east-west route.
- Direct rail links between our regional cities and key **international transport gateways** via CCC interchanges, providing more efficient access to overseas markets.

Development and regeneration:

- Access to a larger labour pool supports the **enlargement of the London Economic Area**.
- **Supports trends** for flexible working, access to affordable housing and quality of life drivers.
- South Bank Central will **unlock the potential economic value** of the area around **Waterloo and Blackfriars** - A possible southern extension to The City's business and financial services district.
- A significant boost to the key regeneration sites at **Elephant & Castle, Vauxhall and Nine Elms**.
- Possible future station in Barking to drive **regeneration in the Thames Gateway**, providing vital access to employment opportunities and unlocking wider housing plans to the east of London.
- Euston Station and surrounding area can **be redeveloped with nearby Kings Cross** in a structured way without HS2 complexity.

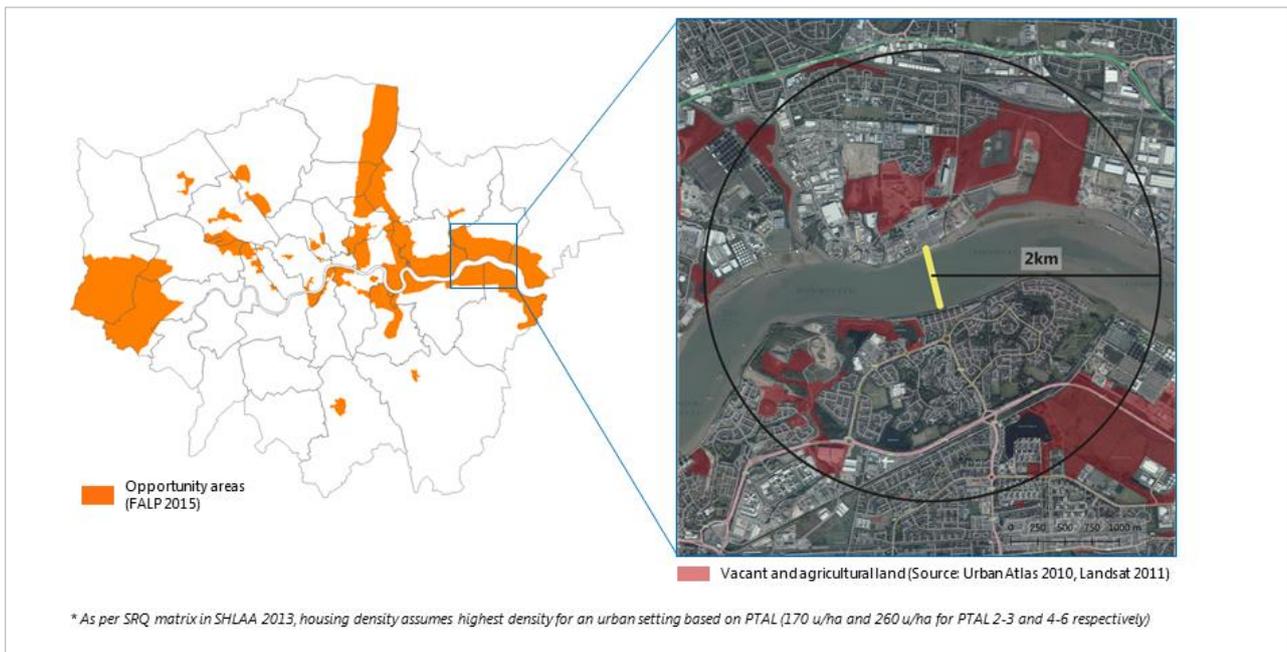

Cost Certainty and Minimal Disruption

- Tunnelling beneath London, following existing rail corridors **manages risk** more efficiently.
- **Through-running** at South Bank Central avoids the need for eleven platforms at Euston's terminus.
- Subterranean stations **minimise land-take** and provide greater opportunity for valuable Over-Site Development. And create significantly lower disruption to working London during construction.
- **Delayed expenditure** of significant public funds to the second phase of the HS2 programme.

B. Low Level Bridges in East London

Working with urban designers Farrells, we have identified how low level bridges will help unlock land for housing development and improve job accessibility for existing and future communities in East London.

As an example, our analysis has shown that within a 2km radius of a potential bridge connecting Thamesmead with Barking Riverside almost 50,000 new homes could be built. A bus connection over the bridge would link Abbey Wood Crossrail Station in the south with the future Barking Riverside overground station in the north and increase job accessibility. It will increase transport network resilience and also enhance access to London's waterfront for the benefit of local residents.

Initial findings have been shared with TfL and the Port of London Authority. More information on our recommendations can be found in a separate BuroHappold / Farrells NIC submission.

How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

There is an absolute need for the current Green Book methodology for the evaluation of transport infrastructure to be thoroughly revised to take into account the full range of benefits – and also to recognise value-destroyers that major transport infrastructure can represent for an area.

As was highlighted by the HS2 Growth Taskforce, and referenced in the NIC Terms of Reference, a major transport infrastructure investment delivers far greater benefits than greater capacity, reliability and faster journey times; In addition to connecting organisations to new markets, connecting jobs and labour drives significant economic value, and the role of interchanges as anchors of local regeneration has been clearly demonstrated in the case of Kings Cross St Pancras. Full business cases need to be created for all major investments, that enable far greater transparency in prioritisation and decision-making.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The currently proposed Crossrail 2 tunnel alignment focuses on locations where there is already substantial development (such as Chelsea and Victoria) and where regeneration is already in progress (such as the Euston Cross area). An alignment that runs further east in the city centre, both south and north of the river, would deliver far greater above station and area wide regeneration benefits. Furthermore, greater consideration should be given to locating underground stations for the tunnel section on alignments which give access to several existing stations. Assuming a route further South, an example might be a station between and linking Elephant and Castle Tube and Surface Rail stations.

To the east and north of the Thames one could consider something which links and integrates Tower Hill Tube, Tower Gateway DLR, and Fenchurch St stations. In this way, the new station can both enhance integration between existing services by creating mega hub stations, and spread over-station redevelopment opportunities over a much larger area. The benefits of such strategies would be considerable. Furthermore, whilst the costs of additional access and egress points might be slightly higher, these would be more than off-set by the reduced costs and disturbance at the existing interchange stations due to a more even distribution of interchange passenger loads, reducing the scale of works to increase local capacity.

4. What are the options for the funding, financing and delivery of large-scale infrastructure improvements in London, including Crossrail 2?

In terms of "Financing", recent major tunnelling projects in London, including Crossrail and the Thames Tideway Tunnel, along with developments in infrastructure financing in Canada, have in our view shown the way forward. Crossrail shows that construction risk, when going underground, is not as great as thought. Indeed, it can now be argued that staying at the surface is far more risky than going underground. Expected return from investors directly correlates to risk. We have seen with Thames Tideway that cost of capital on large tunnelling projects need not be excessively high. What is more, we have a growing pool of funds held by pensions. In Canada this has been mobilised to deliver much needed infrastructure via the major pension investment funds. Pension funds are the perfect vehicle for infrastructure funding of this type, not only creating stable long term returns for those depending on the pensions, but ensuring that contributions made today are being mobilised for the benefit of those making those contributions. A rare win:win.

With such a privately financed structure, one can move to "Delivery" via a public private project company model. If correctly structured in terms of risk allocation, this can deliver significant benefits in terms of ongoing innovation and whole life costing disciplines, while ensuring appropriate controls are retained within the public sector, thus ensuring a company that focuses on its specific business, yet operates within a structure that considers wider social and economic issues.

- What is an appropriate local and regional contribution – given the potential distribution of benefits to business, residents, transport users and the wider economy – and how could this be achieved?

It is clear that investment in transport infrastructure has wide and decisive regional catalytic impacts, enabling residents of both London and the peripheral commuting counties in the South East and Eastern Regions to access employment opportunities in the Greater London area. For example, it is clear that Crossrail 1 will deliver significant economic benefit to the commuting residents of Berkshire, Essex. What's more, if the proposed diversion of western Crossrail services to the WCML goes ahead, Bedfordshire, Hertfordshire and Buckinghamshire residents will also benefit, largely at the expense of London business ratepayers. One could also argue that as workers continue to move further out of London to find homes they can afford, such upfront match investment in transport infrastructure is essential if large employers in central London are to access one of the world's most cosmopolitan, diverse and skilled workforces – due to the many reasons cited in the call for evidence.

Therefore, we recommend that the South East and Eastern Regions are given utmost consideration when contemplating further infrastructure investment in London. As co-beneficiaries, and potential co-funders, of such infrastructure it is

important that their role is recognised in helping London deliver its strategic goals of affordable family housing and a competitive labour supply.

While we understand that there are fora for such engagement in decision making already in place, we think that their role and powers will need to be reviewed given the challenges faced. For example, many of the newly announced City Regions designated as part of the 'Northern Hub' policy constitute an urban city plus the peripheral and commuter hinterland in which significant parts of the labour market reside. These City regions will be given significant powers over infrastructure investment and service level agreements that London does not have over activities in the South East and Eastern Region. This presents a potential comparative disadvantage for London in the planning and funding of such infrastructure.

What is clear is that existing funding models will be insufficient for continued investment of the scale London has witnessed in the last few years. While the Crossrail 1 funding model has been lauded as particularly successful in enabling government to recoup some of the costs from beneficiaries in central London (employers and developers), the next stage will require this pool of beneficiaries to be enlarged further, given the scale of investment required. So, who are these potential additional beneficiaries? The Crossrail 1 experience has shown that they include a far more varied and geographically wider group than initially assumed: residents and employers in outlying commuter counties; speculative buy to let landlords near proposed stations; developers both in London and in outlying commuter areas; and property in London near stations who have seen phenomenally capital gains since the project's route was first announced.

There is an ever-increasing suite of mechanisms available to local authorities to capture value generation from new development – s106, CIL, TIF, and Incremental Business Rates. However, these do not work well when dealing with intra-regional infrastructure developments, such as the proposed Crossrail 2 and other infrastructure benefiting the capital's economic hinterland, or in capturing any capital gains. We recommend that further research is commissioned to investigate the innovative options available to London to both capture some of this capital wealth generation (potentially building on the recently published work of the Centre for Cities "*Beyond Business Rates: Incentivising cities to grow*") and also ensuring enhanced contribution from beneficiary counties on London's periphery.

The new profusion of Local Enterprises Partnerships is, for example, one way that London could seek to ensure that the funding of infrastructure is fair to all beneficiaries – as shown recently by the Hertfordshire LEP's funding contribution to the Metropolitan Underground works at Watford. We should recognise, however, that such arrangements will lead to local calls from the counties for greater scrutiny over such spending decisions, with a widely held assumption that transport services are often skewed in favour of the capital's requirements over these commuting counties. Such discussion over service level agreements and operations is best at the regional level, potentially using the regional fora discussed earlier.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

- Construction of rail stations underground is now well-established – eg The recent underground Magenta station in Paris between Paris Nord and Paris Est stations.
- Terminus stations in cities have been rejected in favour of through stations in a number of major European cities including Berlin, Vienna, Stuttgart and Marseilles.....and historically in Brussels, the old north and south stations were connected to make a through line.
- The 7 Line Subway Extension in New York is being funded with NYC funds from bond sales to be repaid with property tax revenues from development in the area around the new station (the Hudson Yards). Other transport projects in the US are similarly financed (e.g. Atlanta's Belt Line)..
- Hong Kong's MTR are developing real estate and transport themselves.
- BRT as a potential 'cheaper' option to connect areas of London that are poorly served by public transport. New York serves as a good example of how they are trying to upgrade their bus network to areas that are less served.

LONDON'S TRANSPORT INFRASTRUCTURE:
RESPONSE TO NIC CALL FOR EVIDENCE

BSA - The Business Services Association

Response to the National Infrastructure Commission Consultation

January 2016

Large-scale transport infrastructure improvements in London

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades.

According to Centre for Cities, between 2004-2013, London's population grew faster than any other of the UK's top ten metropolitan areas¹. The Greater London built-up area is nearly five times larger than the next largest of Greater Manchester. This means London has unique infrastructure pressures.

High house prices, coupled with population growth, will likely see more people move to the outskirts of London in search of cheaper dwellings. This development will necessitate improvements to suburban train lines such as Thameslink, Southern and Chiltern Railways in order to cope with increased demand along with a more positive and ambitious residential and mixed use development at and around local stations (both existing and planned). A limited amount of track space already hinders these often overcrowded services, a difficulty that will be exacerbated by a lack of investment and redevelopment.

This picture of steady, rapid growth means London's already strained transport network will face increasing pressure. Crossrail will add 10% capacity to the capital's rail network, however former TFL Commissioner, Sir Peter Hendy, has previously said that it will be 'immediately full' upon opening. This therefore suggests that a second major rail line is needed across London and the BSA welcomes proposals to explore the construction of Crossrail 2.

As with the first Crossrail, refurbished and increased station infrastructure will be a critical component of the project. Stations should be viewed as centres of their community, providing a basis for growth and development. New and improved stations with stable levels of investment can act as a catalyst for both housing and business development. In London especially, proximity to a train station is often a key consideration for someone looking to buy a home. Similarly easy access to transport links often affects a business' location decision. It is imperative that decision-makers take a whole community view of an individual project when judging its merits.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Crossrail 2, similar to the original Crossrail, offers London an opportunity to add significant capacity to its transport network. As previously mentioned, if Crossrail is full upon opening in 2018, the need for additional capacity will be immediate. The BSA would therefore encourage the development of the Crossrail 2 project as rapidly as is appropriate and necessary. Crossrail 2 will mean the East-West and North-South corridors of London will be served by a high-tech, far reaching and modern rail

¹ <http://www.centreforcities.org/wp-content/uploads/2015/01/15-01-09-Cities-Outlook-2015.pdf>

service. It also creates an opportunity to plan significant new housing above and around many of the proposed new stations which needs to be seen as an integral part of the Crossrail 2 project and not just an afterthought.

Additionally, the Commission should examine closely options for renovating and rebuilding parts of Euston station. As a key hub station, providing access to the North West and Midlands it is already overburdened and in need of investment. Factor in Euston's role as HS2's London hub and proximity to a proposed stop on the Crossrail 2 route and the need to substantially upgrade the station is clear.

Crossrail should not be the only means by which London seeks to expand its intra-city rail service. The capital has already seen new rolling stock introduced on the tube network, such as on the Metropolitan Line, Hammersmith and City Line and Victoria Line in recent years. A number of planned extensions will increase the reach of the tube network, helping create jobs. According to TFL, the Northern Line's Battersea extension will create 24,000 jobs and 18,000 new homes by 2020². The National Infrastructure Commission should explore the possibility of further tube extensions as London continues to grow both in terms of people and square miles. The business case for individual projects and investment, particularly the strategic and economic case, are key to working through prioritisation and economic impact. It is crucial that the business case is cross-agency, able to compare a range of transport and other infrastructure investment.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Starting construction on Crossrail 2 sooner will increase the benefits of job creation and adding capacity. The original Crossrail provides a bountiful source of construction workers, designers and engineers with much needed experience of building a brand new, cross-city, subterranean railway line. Lengthy delays in beginning construction risks this pool of workers dissipating and being committed to alternative projects. Government must offer assurance and clarity as to whether and when Crossrail 2 will be built. As soon as this is offered, businesses can begin the necessary training and upskilling of workers needed to deliver the project.

The BSA urges the government to recognise the benefits of allowing for a seamless transition between major infrastructure projects. Crossrail and Crossrail 2 are an obvious example, being in the same geographical location, requiring the same equipment and demanding the same skills. The National Infrastructure Plan for Skills estimates a shortfall of nearly 400,000 construction and engineering jobs by 2020³. A lack of seamless transition between projects will exacerbate the problem.

The option of phased implementation should be looked at, which could mean that some of the Crossrail 2 infrastructure is not only built, but in operation ahead of 2028. This could allow for increasing London's transport capacity gradually and earlier than if the line was opened all at once. Particular attention should also be paid to development at key nodal points, where a number of major train lines will meet. This in turn should create 'spin-off' regeneration opportunities for housing and businesses to develop in these nodal points where they otherwise wouldn't have.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Tax Increment Financing (TIF) offers a particularly beneficial structure for funding large-scale transport infrastructure improvements in the capital. This is due to the relatively high-concentration of businesses, particularly around Central London. TIF works by dedicating a proportion of future tax revenues (normally business rates in the case of the UK) for infrastructure and development. The improved connectivity derived from such projects would usually see an increase in business rate revenue, providing a viable option for funding large-scale transport infrastructure. However, given that councils will soon be allowed to keep a portion of their business rate revenues, it will require coordination across all of London's boroughs.

In addition, opportunities for significant residential development at and around new stations and transport interchanges creates an opportunity to secure a mix of capital receipts and new revenue streams to support new transport investment.

As raised in the 2015 Autumn Statement and Spending Review, the pooling of local government pensions funds offers a potentially significant source of funding for infrastructure investment. Pooling the pension funds of London's local authorities, as well as possibly including other bodies such as Transport for London, will allow a greater single pot of investment. Pension funds have the advantage of being able to invest in projects which look longer-term. Infrastructure investment is ideal for pension funds as it offers very low risk due to being underwritten by the government and delivering steady, long-term returns.

In order to support the effective delivery of large-scale transport infrastructure, it is important that an ambitious but realistic time-frame for completion is put in place. A recent National Audit Office report said a project with lengthy timescales negatively affect the continuity, whilst short timescales can make delivery a virtual impossibility⁴.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied?

BSA members have experience of constructing major infrastructure projects across the globe, including, but not limited to, Canada, U.S.A. and Dubai. As with the UK, stability is key to the success of any infrastructure programme, with constructors reliant on the assurance that long-term projects will remain funded and immune from sudden changes or cancellations.

Singapore and Hong-Kong, as major, densely packed metropolises with high demand for transport infrastructure have taken the approach of 'upwards not outwards'. Given the limits on space that exist in both cities, particularly Hong-Kong, projects are being proposed and implemented that will see transport systems make use of space above the city rather than spreading outwards.

⁴ <https://www.nao.org.uk/report/delivering-major-projects-in-government-a-briefing-for-the-committee-of-public-accounts/>

Large-scale transport infrastructure improvements in London

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London is likely to continue to face issues associated with accommodating increasing population and in-commuting. Important among these will be the issue of air pollution.

Transport for London has reported that the number of trips made in London in 2013 averaged 26.1 million per day, an increase of 1.2 per cent over the previous year (including residents and non-residents).

Within this, there are a number of important trends. Over the 10-year period from 2003-2013, total trips increased by 11.4 per cent, with rail increasing by 52.3 per cent, Underground /DLR by 32 per cent and cycling by 53.9 per cent. By contrast, car driver trips decreased by 12.7 per cent over the same period. [<http://content.tfl.gov.uk/travel-in-london-report-7.pdf>]

Despite the fall in car numbers, legal compliance with air quality limits remains a very significant problem. The national Air Quality Strategy, published by DEFRA in 2015 [https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/486636/aq-plan-2015-overview-document.pdf] reports that the Greater London urban area currently has the highest NO₂ exceedance in the UK and that the capital's transport networks and construction activity means the task of reducing NO_x emissions, and NO₂ concentrations, is the most challenging in the country.

The London Mayor is taking forward a package of measures to bring London into compliance with NO₂ limit levels in the shortest possible time. This includes reducing emissions from buses and taxis, and introducing an Ultra Low Emissions Zone from 2020. Despite these initiatives, air quality is not expected to be compliant with legal standards before 2025.

In sum, new transport infrastructure and initiatives will be needed to move increasing numbers of people around greater London while actively reducing air pollution and its impact on human health. Increased demand for rail, Underground and cycling together with a marked fall in car driving all have the potential to help achieve this goal.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

It is vital that investment priorities are clearly aligned with wider policy objectives and legal requirements. In keeping with our response to Q1, potential schemes should be prioritised with clear regard to legal responsibility concerned air quality and long term trends away from car use and toward public transport. In this regard, we are concerned by plans for further Thames crossing schemes based on road transport which stand to break positive trends away from car reliance and increase local air pollution concerns. More detail is given in our response to the river crossings consultation in 2014

[http://bettertransport.org.uk/sites/default/files/research-files/CfBT_TfL_River_Crossings_Consultation_Sep2014_FINAL.pdf].

Open Consultation

National Infrastructure Commission call for evidence

London's transport infrastructure

The National Infrastructure Commission is a new, independent body which will look at long term infrastructure needs and provide impartial advice to ministers and Parliament. Before next year's budget they will publish a report on *large scale transport infrastructure improvements in London*.

You are strongly encouraged to provide details of the evidence and data to support your arguments to enable the Commission to understand more fully the basis on which conclusions have been reached.

Please note, the Commission will not be considering questions relating to airport capacity. The Airports Commission has already examined this issue in detail.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

<p><u>Reduce journey numbers</u></p>

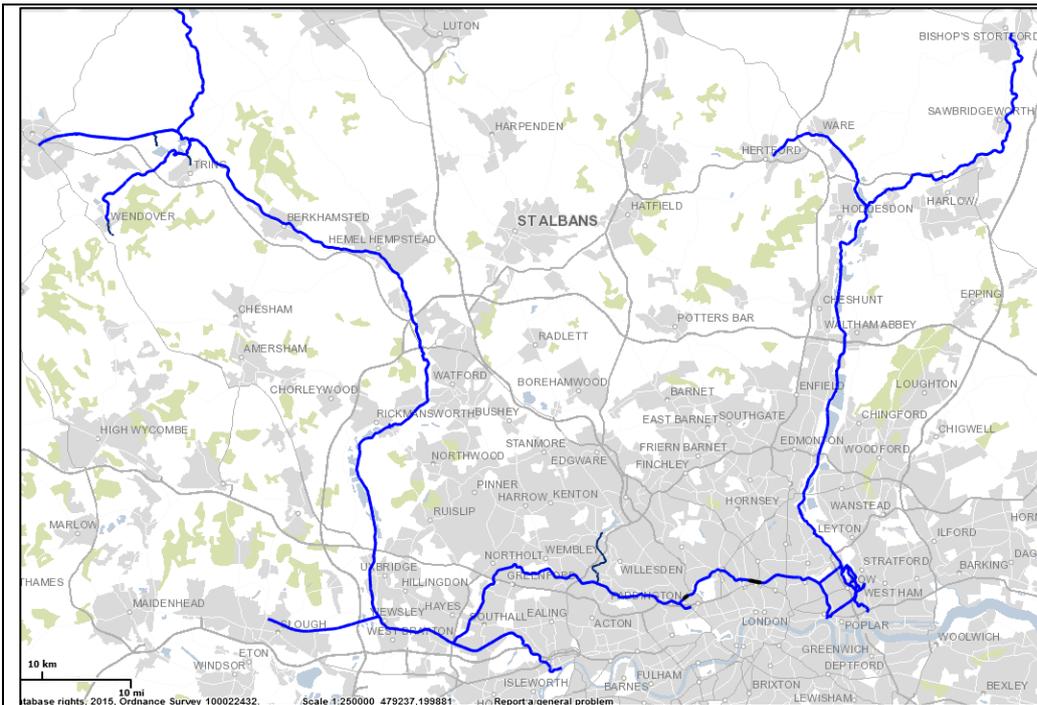

<p>What further measures can be taken to better integrate land uses (residential, employment, education, health etc) to reduce the need to travel, including use of technology and flexible working.</p>
--

<p><u>Cycle-friendly public transport</u></p>

<p>Consider further how trains and buses can better accommodate carriage of bikes as a means of continuing journeys with a view to relieving peak pressures on rail and road.</p>

<p><u>Sustainable Travel</u></p>

<p>Canal and river towpaths offer attractive traffic-free routes for people to travel to work, school and for leisure. Canal & River Trust's has around 100 miles of waterways and towpaths in the Capital and surrounding areas, including around 65 miles within the fifteen London boroughs north of the Thames. These waterways connect the Lee Valley, Central London and the West (see map below)</p>

The Trust's Waterways in the London Area

Waterways support London's growth, connecting people to key employment, opportunity and visitor destinations such as:

- London Docklands
- Meridian Water Enfield
- Tottenham Hale
- Stratford and the Queen Elizabeth Olympic Park
- Kings Cross
- Paddington Basin / Little Venice
- Old Oak Common & Park Royal MDC
- Southall Gas Works
- Crossrail western extension – Hanwell, Southall, Hayes, West Drayton, Iver, Langley, Slough

Cleaner Air for London

Along with other measures, towpaths contribute to reducing vehicular congestion and air pollution within London. For example, the Environmental Audit Committee's Action on Air Quality Report mentions a broader role for LEPs and Regional Growth Funds to achieve cleaner air quality alongside their jobs and growth targets.

Value for Money

The past 15 years has seen significant growth in popularity and use of London towpaths, in particular on the Regents Canal which serves Central London and the City. Some London towpaths are expected to receive investment from the Mayor of London's Cycling Vision as Quietways. However, the Regents Canal (expected to remain the most heavily used) and the River Lee Navigation are excluded – both could be improved significantly for commuter and local journeys on foot and bike.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2?

Adequate cycle storage for peak time travel on public transport.

Consider interchange facilities at public transport hubs for connections to nearby canal towpath routes for walking and cycling, including provision of appropriate cycle parking, cycle maintenance services, lockers, toilets and showers to encourage onward bicycle journeys.

Information on links to walking & cycling routes for leisure passengers should be made more easily available on public transport – for example for journeys made one way by train and return by foot or bicycle along towpaths.

2a. How should they be prioritised, taking account of their response to London’s strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

No comments

2b. What might their potential impact be on employment, productivity and housing supply in London and the southeast?

No comments

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Freight Transport by Water

The Trust believes that the environmental impact of the construction phase of Crossrail 2 can be reduced by taking advantage of the River Lee Navigation (a Commercial Waterway).

The Trust has engaged in preliminary conversations with the Crossrail 2 team regarding the opportunity of using the River Lee Navigation as a freight transport corridor to move materials (both construction materials and waste) from the tunnel portal in the Tottenham area out onto the River Thames, via a transfer facility that could be constructed in the Bow area of East London. We would very much like to continue this dialogue and would suggest that the NIC/Crossrail 2 team commission a feasibility study to look at this (and other) options in more detail. Our experience of projects of this nature in the past has led us to conclude that this feasibility study work needs to be undertaken several years ahead of the proposed start of construction.

Safe and sustainable routes to work

We believe that part of a sustainable transport policy during the construction phase of Crossrail 2 should include the provision of safe and sustainable routes to work – providing opportunities for the workforce to move away from cars and trains and over to walking and cycling to work. The towpaths running along waterways of London could be part of an integrated Crossrail 2 workforce

transport network and we would like to work with the NIC/Crossrail 2 to develop this concept further.

Utility Corridors

Beneath many of the Trust's London towpaths there are buried utilities such as fibre optic and high voltage electricity cables. These take advantage of direct and straightforward routes around and through the Capital. The Trust believes that further development of these utility corridors could be undertaken to allow improved communications and/or asset resilience.

Energy Production

The water flowing through the Trust's 3200 kilometres of waterways (of which around 100km which pass through and around London) contains enough thermal energy to produce approximately 640 MW of energy. This has attracted a number of businesses which now utilise this low carbon source to heat and cool their buildings. DECC to have acknowledged this potential in their Heat Map which includes a specific canal layer <http://tools.decc.gov.uk/nationalheatmap/>. The energy is extracted using water sourced heat pumps which are very efficient compared to conventional forms of heating and cooling. These efficiency improvements will help reduce the electricity demand and assist in balancing electricity supply. In order to realise this benefit the Trust would urge the NIC to recommend that the renewable heat incentive (RHI) is retained so that this nascent technology can be deployed more widely and possibly assist with the energy requirements of Crossrail 2.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Response by Canary Wharf Group to National Infrastructure Commission

0 Summary

0.1 Canary Wharf Group Limited (CWG) is pleased to respond to the call for evidence from the National Infrastructure Commission (NIC) on London's future transport infrastructure. The key points are:

- According to the London Plan, London's housing growth will be primarily focused in east and south east London, highlighting the need for additional transport infrastructure to improve access to areas, particularly those adjacent to the Thames on both sides of the river
- Even with planned rail improvements, there is still a need to enhance orbital rail routes/capacity as a means of providing a better alternative to road travel across Greater London as a whole and also reducing pressure at Central London termini and interchanges
- Crossrail 2 is supported as a means of providing additional rail capacity, but in its original north east – south west orientation.
- The costs of Crossrail 2 could be reduced by:
 - reviewing the alignment in south west London and restricting tunnelling to the section north of Clapham Junction
- The benefits of Crossrail 2 could be enhanced by:
 - extending services in the north to Stansted
 - providing a new eastern branch to serve London Riverside
- Other priorities for transport investment include:
 - New road/rail river crossings east of Tower Bridge
 - Improved orbital and radial road capacity
 - Extension of Crossrail 1 to Ebbsfleet, subject to further capacity studies and provision of at least 30 trains per hour through the Isle of Dogs
 - Further extension of the Bakerloo Line (over and above the recently announced extension to Lewisham) to include a route through Surrey Quays, the Isle of Dogs (and potentially beyond to open up areas adjoining the Thames including the Greenwich Peninsula and Charlton Riverside for housing growth and other development), linking a string of Opportunity Areas identified in the London Plan 2015
 - ensuring road capacity and accessibility meets the needs of essential servicing / delivery vehicles, buses and cyclists.

0.2 CWG would welcome further discussion with the NIC on the ideas presented in this response.

1 Introduction

- 1.1 This evidence for the National Infrastructure Commission (NIC) on London's future transport infrastructure is prepared by Canary Wharf Group Limited (CWG).
- 1.2 CWG is keen to ensure that over the next 30+ years existing and future transport infrastructure will support the Greater London Authority's ("GLA") and Transport for London's ("TfL") objectives as set out in the London Infrastructure Plan 2050: to ensure the foundations for London's continued success as a Global City; to help house a growing London; to support a better, not just bigger, London; and to innovate to develop a transport system of tomorrow.
- 1.3 CWG feel that infrastructure investment should facilitate the maximisation of development potential in the Opportunity Areas (OAs) identified in the London Plan 2015, in particular those in east and south east London.
- 1.4 We recognise that the Commission will not consider opportunities related to airport expansion, and have borne this in mind in preparing this response. We note though that when a decision is made, important choices will need to be made on the locations of transport infrastructure, to ensure flexible services are provided serving all of London's airports and potential expansion locations.
- 1.5 We note that the Commission is not currently tasked with looking at ways to reduce the need for major capital projects by better use of existing and future capacity. Technology and other measures should be explored to achieve better use of infrastructure capacity.
- 1.6 The response is set out as follows:
 - **Section 2** – London and its hinterland – major economic and social challenges
 - **Section 3**- Strategic large-scale transport options, including commentary on potential funding
 - **Section 4** - Crossrail 2 - improving the cost: benefit ratio.

2 London and its Hinterland - Major Social and Economic Challenges

High population and employment growth

- 2.1 The key transport infrastructure challenges, and underlying trends such as population and employment growth have been researched by the GLA and TfL and other interest groups, notably within the London Plan 2015. The GLA predict that London's population could grow from 8.6 million in 2015 to potentially 13.4 million by 2050. The GLA also forecast that the number of jobs within London could increase from 4.9 million in 2015 to 6.3 million by 2041.
- 2.2 Actual growth in travel has also been greater than the forecasts in the Mayor's Transport Strategy (source: GLA London Infrastructure Plan: Transport Supporting Paper (2014)). This further highlights the need to proactively plan and implement substantial improvements to transport infrastructure, particularly to accommodate growth in public transport trips.
- 2.3 TfL estimates public transport trips could increase by up to 60% by 2050, based on projected population growth, with continuing trend mode shift from car use given increasingly dense patterns of development. This underlines the need for further major investment in public transport.

Housing demand

- 2.4 London's forecast population growth will need 49,000 additional homes each year, but only 30,000 are being completed each year. The Future of London's London 2050 workshop concluded "supply of housing [is] an enabling tool for economic growth in London. Housing, taken as a piece of infrastructure, is one of the most (if not the most) important risks to London's economy." Housing demand into the foreseeable future exceeds supply, resulting in high housing costs. Effective transport investment can help by improving connectivity with lower cost areas in London's hinterland, opening up new areas for development and facilitating densification within London.

Ageing population

- 2.5 The London Plan estimates that the number of people over 64 is projected to increase by 64% (nearly 580,000) to reach 1.49 million by 2036. The over 90s are expected to grow in number over the same period, by 89,000. This will require further investment in accessible public transport including flexible demand responsive services and use of vehicles with wheelchair access.

Reducing commuting times

- 2.6 London has the longest average commute time in the UK - 56 minutes per trip each day. Lower value housing areas located along the radial road and main line routes out of London are increasingly being used by commuters, leading to transport infrastructure capacity constraints.
- 2.7 Transport investment should increase capacity on strategic routes, particularly underground and rail routes and this should be combined with high density development around stations. It should improve service reliability, reduce overall journey times, reduce congestion at terminal stations and improve interchange opportunities outside Central London.

Transit-oriented development

- 2.8 London needs higher density development around public transport nodes and increased public transport accessibility to redevelopment and regeneration areas. The focus for investment should be to unlock and raise the cap on development potential, especially within the Opportunity Areas and Areas for Intensification identified in the London Plan, potentially generating greater surplus value to help fund infrastructure delivery.

3 Strategic Large-Scale Transport Options

Priority Rail and Underground Schemes

- 3.1 Key rail and underground network interventions should improve capacity and connectivity within London and on radial links with its hinterland. These should be combined with strategic interchanges between radial and orbital routes to reduce pressure at terminal stations. National Rail's corridor upgrades as shown in the 2050 London Infrastructure Plan should be a priority for funding.
- 3.2 CWG supports Crossrail 2 in principle, as it opens up important connections needed to allow London to grow. However the planned scheme does not tackle the transport challenges outside central London/West End, nor does it address London's Opportunity Areas very well. Therefore, it needs to be complemented by new rail capacity to improve connectivity between and to other key centres of employment and major new development – the City, Canary Wharf (incl. Poplar and Isle of Dogs), City in the East/Tilbury Port, Euston/Kings Cross/St Pancras and Old Oak Common/Wembley.
- 3.3 CWG ask that the Commission consider in more detail the following rail, DLR and underground improvements that meet the strategic objectives by improving both accessibility and connectivity. Prioritisation should be given to schemes which provide improved connectivity, in particular reliability and speed of journeys and which unlock the delivery of housing and jobs within London:
- Crossrail 1
 - provide a new link to the West Coast Mainline from Old Oak Common
 - extend services east to Gravesend and Ebbsfleet, to provide interchange with HS1 services, subject to further capacity studies and provision of at least 30 trains per hour through the Isle of Dogs
 - Crossrail 2 (see more detail in section 4)
 - consider fuller scheme, with extensions to Stansted airport and to Barking Riverside / City in the east (supporting major housing development)
 - simplify scheme in south west London to reduce tunnelling costs
 - take over a Crossrail 1 branch as part of Crossrail 2, providing an interchange station between Crossrail 1 and 2 at Liverpool Street/Shoreditch and seek to avoid problems of turning trains and imbalances associated with Crossrail 1
 - Further east-west rail capacity in the areas adjoining the River Thames in east London in order to support development e.g. Crossrail 2 branch and/or Bakerloo line extensions
 - Bakerloo line extensions over and above the recently announced route from Elephant & Castle to Lewisham, to open up areas of development on the north as well as the south side of the river and improve transport capacity and resilience in east and south east London
 - A new Brighton – Gatwick – Stansted rail link via East London, interchanging with Crossrail 1 and Crossrail 2
 - New orbital rail routes including routes using new river crossings east of Tower Bridge with enhanced interchanges outside Central London, to improve peripheral connectivity and reduce congestion at main termini, such as extensions to the London Overground and improvements to interchange at locations such as Lewisham

- Upgrade main termini to improve passenger experience and reduce congestion
- Increase central /suburban rail capacity - through selective interventions, including capital investment and increasing train lengths.
- World class tube – fund signalling improvements and removal of congestion points to increase running capacity to at least 36 trains per hour on all routes
- Provide Northern Line Extension from Battersea to Clapham Junction
- DLR improvements including:
 - General capacity enhancements, improved service frequencies and upgraded stations
 - An extension from Bank to Euston, including a new station at Tower Hill (to facilitate closure of the Tower Gateway branch)
 - Further extensions to key centres such as Barking and Thamesmead.

Priority Road Schemes

3.4 CWG considers there is a need for a bold approach and agreement to a programme of schemes designed to bring London’s road network up to date including consideration of tolls, road pricing applied to all road users as well as extending the Congestion Zone in order to help fund improvements. Priorities for capital investment in road schemes should focus on providing and improving key links in the road network to improve connectivity, capacity, reliability and journey times, particularly for buses and essential servicing and delivery vehicles. It is particularly important to provide additional Thames crossings east of Tower Bridge to link the OAs in east London, north and south of the river, to maximise development capacity and improve economic synergies in the key development opportunity in London. Priority schemes include:

- Thames crossings in east London, notably at Gallions Reach
- Improved Orbital Routes, such as enhancements to the North and South Circular Roads:
- Underpasses / tunnels (to enhance capacity and improve urban realm), such as a link from the A13 to the A4 via Central London.

Key Funding Priorities

3.5 CWG ask that the Commission gives further consideration to several schemes which appear to offer the best outcomes relative to the GLA’s strategic objectives:

- Crossrail 1 extensions, particularly to Ebbsfleet and the West Coast Main Line
- Crossrail 2 extension to open up access to London Riverside
- Further extensions of the Bakerloo Line to serve planned regeneration areas and Opportunity Areas either side of the River Thames in East London.

Potential Funding Approach

3.6 London has an established framework for strategic spatial and transport planning, through the London Plan and the supporting Mayor’s Transport Strategy. The London 2050 Infrastructure Plan consultation sets the context for the development of the next London Plan and MTS.

3.7 It is imperative that strategic planning, and the infrastructure priorities that stem from this are supported by a long-term, consistent and sustainable funding stream. This means London needs more control over long-term funding and financing of strategic infrastructure.

- 3.8 The principle that the beneficiaries of major investment (people and businesses in London) should fund investment is compelling, and will ensure greater buy-in to infrastructure investment. Fiscal devolution would enable this, and remove some of the political uncertainty of major infrastructure decisions being made by Treasury, where long-term investment could be subject to political risk based on the false perception that investment in London is at the expense of other areas.
- 3.9 CWG support the ambition towards greater fiscal devolution of business rates and property tax revenues. Local income taxes are another option, which we think should apply regionally rather than just in London (as so many in the south-east commute into London, shop and use other services here).
- 3.10 In considering rail investment specifically, we note the recent successes of public/private approaches in London, including:
- Over-station development funding new stations, e.g. Crossrail 1 at Canary Wharf
 - Development cross-funding the provision of the station box at Woolwich Arsenal Crossrail 1 station
 - The anticipation that the Northern Line Extension from Kennington to Battersea Power Station will be fully funded by developments in the Vauxhall Nine Elms and Battersea Opportunity Area.
- 3.11 In considering road investment specifically, we also support the principle of road user charges to better manage London's road network (with tariffs allied to congestion) and to fund vital new road infrastructure. This would be more equitable than the current road tax and fuel duty.
- 3.12 In view of the desire to discourage private vehicle use, funding priorities should be focussed on increasing capacity on rail, DLR, tram and underground services, to open up new areas for housing and development, as well as addressing existing capacity constraints. Nevertheless, funding for roads should also be made to ensure sufficient capacity is provided for the needs of essential servicing / delivery vehicles, buses and cyclists.
- 3.13 Infrastructure providers should also consider ways for development opportunities, such as major housing schemes, to cross-fund new infrastructure.

4 Crossrail 2 – Improving the Cost: Benefit Ratio

Commentary

- 4.1 Crossrail 2 is currently proposed by TfL as a scheme linking Epsom and other locations in south west London with Broxbourne in Hertfordshire and New Southgate in north London.
- 4.2 Although a strategic north-south link will help London to grow and relieve congestion on key underground lines and at Network Rail termini, the proposed scheme misses the opportunity to help open up major housing and employment sites in east and south east London. It also does not serve major destinations such as Stansted Airport.
- 4.3 In south west London, there appears to be duplication with existing suburban services terminating at Waterloo. While possibly relieving congestion, this will add to operational complexity. The tunnelling options in south west London / Chelsea seem to be unnecessarily circuitous and lengthy. Consideration should be given to reviewing the proposals in south west London and providing the tunnel portal closer to Clapham Junction.
- 4.4 Crossrail 2 supports development of 200,000+ new homes along its alignment. It increases capacity between Clapham Junction and Euston, reducing pressure on the underground (especially the Northern and Victoria Lines) and freeing up track and platform capacity at Waterloo and Victoria stations. Connectivity is improved by new interchanges:
- **HS1** - at Euston/ St Pancras
 - **Crossrail 1** - at Tottenham Court Road
 - **Thameslink** – at Euston/ St Pancras
 - **Suburban routes - south** - at Wimbledon /Clapham Junction
 - Suburban routes - north - Tottenham Hale.
- 4.5 It is essential that the new interchanges are designed with sufficient capacity to comfortably handle anticipated passenger flows. This is particularly important at Tottenham Court Road where Crossrail 2 would interchange with Crossrail 1, the Central Line and the Northern Line and the expected numbers of interchanging passengers will be very high.
- 4.6 As currently proposed, Crossrail 2 would provide the primary route to Canary Wharf from the majority of south west London, with passengers interchanging onto Crossrail 2 at Tottenham Court Road. It would provide comparable journey times to the current route via Waterloo and the Jubilee Line, although waiting times for Crossrail 1 at Tottenham Court Road would be longer than those for the Jubilee Line at Waterloo.
- 4.7 10% of Canary Wharf employees currently pass through Waterloo, which the ‘Office of Road and Rail’ recently identified as Britain’s busiest rail station (99.2m entries/exits between 1 April 2014 and 31 March 2015). Recent analyses of TfL Railplan data by CWG have also highlighted that the Jubilee Line is likely to experience increasing congestion in the future in the absence of Crossrail 2. Therefore, CWG sees Crossrail 2 as important for providing journey choice and resilience and reducing waiting times for passengers joining the Jubilee Line at busy times, notably at London Bridge in the morning peak period, especially when Thameslink 2000 is fully operational.
- 4.8 The need to interchange at Victoria mainline station would also be reduced, which is currently Britain’s second busiest mainline station (85.3m entries/exits between 1 April

2014 and 31 March 2015). Particularly in the shorter-term, Crossrail 2 is also likely to relieve the Victoria Line and the Charing Cross branch of the Northern Line.

- 4.9 It is important that real-time information for all key routes is provided on trains on all lines including Crossrail 1, Crossrail 2 and the Jubilee Line. This will ensure that passengers can make informed decisions about which routes to use and where to interchange, based upon up-to-date knowledge of operating conditions and train occupancies.

Suggested improvements

- 4.10 CWG considers that the effectiveness of the current Crossrail 2 proposals could be improved as follows:

- Provide a branch from Euston/St Pancras to east London taking over the Crossrail 1 branch to Shenfield with a Crossrail 1/Crossrail 2 passenger interchange at Liverpool Street/Shoreditch. This would enable the Abbey Wood branch of Crossrail 1 to run with up to 30 trains per hour and would provide more rail capacity to and through the Isle of Dogs and Opportunity Areas in east and south east London
- Subject to further detailed capacity studies and provision of 30 trains per hour through the Isle of Dogs, it would be possible to extend Crossrail 1 to connect with HS1 services at Ebbsfleet and assist with regenerating North Kent Thameside
- If Crossrail 2 were to take over the Shenfield branch, it may also be possible to build another Crossrail 1 branch east of Custom House possibly taking over all or some of the c2c lines. This would support major housing development areas and higher density development in the east London Opportunity Areas including the Isle of Dogs, Royal Docks and London Riverside
- Extend Crossrail 2 services to serve Stansted Airport. This would significantly improve connectivity between central London/ City /east London and Stansted Airport and between Stansted and Heathrow as well as increasing the housing and employment development potential in the Upper Lee Valley Opportunity Area and beyond.
- Relocating the tunnel portal nearer Clapham Junction. This would reduce the costs of the route in south west London.

Infrastructure for a physically active nation

Submitted by Dr. Angie Page and Jess Read MSc., Centre for Exercise, Nutrition and Health Sciences, University of Bristol

Dr. Angie Page is Reader in Physical Activity and Public Health at the Centre for Exercise, Nutrition and Health Sciences at the University of Bristol.

Jess Read holds a MSc. in Nutrition, Physical Activity and Public Health with distinction from the University of Bristol. She has worked for 15 years as an urban planner delivering innovative “liveable cities” projects for cities such as Copenhagen, New York, Shanghai, and London typically using urban flood mitigation to co-finance walking and cycling infrastructure upgrades. She currently works at the Centre for Exercise, Nutrition and Health Sciences at the University of Bristol.

Physical inactivity is estimated to cause 17% of deaths¹ and costs the nation £20 billion per year². The government ambition set out in “*Moving More, Living More*” is for a more physically active nation with all the potential health, social and economic benefits this can provide³. National physical activity and transport surveys provide clear evidence that transport is one of the most important sources of physical activity for both adults and children⁴. UK policy endorses that transport should assume physical activity delivery as a primary objective⁵.

UK levels of physical activity are low for adults and children⁶. This disproportionately affects women and girls. For example, there are currently over 10 million adult women in England alone who do not achieve the national physical activity guidelines of 150 minutes of moderate-to-vigorous physical activity per week⁷. Gender inequity is evident across physical activity settings, socio-economic categories and age⁸, indicating that a gendered approach to facilitating physical activity is necessary to equally include women. As such, **walking and cycling infrastructure must be designed specifically to meet women’s needs present and future as walking is their single most important source of physical activity.**

Pedestrian and cyclist safety in England is poor in both absolute and relative terms. The rate of killed or seriously injured per billion miles is almost 20 times higher for pedestrians than car occupants (484 vs. 25 respectively) and 43 times higher for cyclists than car occupants (1080 vs. 25 respectively)⁹. These rates are 3 to 10 times higher than absolute traffic injury rates of European counterparts such as Sweden, Denmark and the Netherlands, and up to 19 times higher when comparing rates for children¹⁰. Even allowing for the methodological limitations of traffic injury rates per distance travelled, this international data clearly suggests that our national traffic safety ambitions can be improved. Many cities across the world are adopting **zero accident targets for pedestrians.**

The economic case for infrastructure investment can not be made effectively without considering impacts on health. This is equally true for all areas of England including the north.

To this end, the following actions should be embedded as part of the national infrastructure strategy.

- 1) The inclusion of walking and cycling infrastructure within the infrastructure plans at a scale sufficient to facilitate measurable population increases in physical activity year-on-year in line with UK policy and the national physical activity ambition and Chief Medical Officers' national physical activity recommendations for both adults and children.
- 2) Ensuring that design and access to new walking and cycling infrastructure is open to currently underserved groups, particularly women and girls.
- 3) New planned infrastructure will deliver improvement in safety for pedestrians and cyclists measured in absolute terms as killed or injury per distance travelled, with a progressive goal towards zero deaths and serious injury for pedestrians and cyclists.
- 4) Further development of economic costs for different forms of travel in relation to economic, societal, climate and health benefits. This should include assessment of impacts on health, health costs, productivity, local spending, congestion, accidents, and air pollution.

This is an incredible opportunity to put physical activity and the nation's health at the heart of this national infrastructure investment strategy. This is the type of joined-up, innovative response widely recognised as necessary to increase population levels of physical activity and reduce disease risk both of which contribute directly to economic prosperity.

Introduction

Over the past decade we have seen infrastructure creep up the agenda to a point that it is now firmly placed at the heart of the political debate. With investment in major transport, energy and utility projects increasing to record highs and the development of the National Infrastructure Plan to set out key Government priorities, we have reached a stage where infrastructure is a nationally significant issue that transcends party political ties.

The formation of the National Infrastructure Commission last year was greatly welcomed by the industry and provided a great level of confidence in the deliverability of major projects and enables the current Government and future administrations to speed up decision-making on vital transport, energy and housing programmes that Britain needs to continue to grow its economy.

CH2M is a global engineering and programme management company that works in the areas of areas of water, transportation, environmental, energy, facilities and defence. With over 2,500 people employed in the UK, CH2M is currently working on some of the most iconic infrastructure programmes including Crossrail, High Speed 2, Thames Tideway Tunnels, Crossrail 2, the decommissioning of Dounreay and was one of the leading partners in CLM, Delivery Partner to the ODA for the London 2012 Olympic & Paralympic Games.

Given our experience of working on the development and delivery of major UK infrastructure projects, we felt it may be helpful to share some of our thoughts around the points laid out in the NIC's call for evidence in order to share the lessons learned for the efficient delivery of future infrastructure priorities. In particular, this document presents our views for large-scale transport infrastructure improvements in London. We have made separate submissions outlining our views for infrastructure priorities for northern cities and electricity interconnection and storage.

Large-scale transport infrastructure improvements in London

Q1 – What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

In order for London's economy to continue to thrive and be globally competitive, London will need a step change in investment over the next thirty years that not just upgrades existing infrastructure but catalyses the city's growth through intensification of development in opportunity areas outside the central core.

The dense clustering of businesses in the centre creates synergies (agglomeration benefits) that make Inner London one of the most productive regions in Europe¹. These synergies are dependent on a network that efficiently moves millions of people per day to and from their place of work. Despite technology being available for employees to work remotely, strong demand for office space in Central London demonstrates that being physically present is as important as ever and the need to move large numbers of people to and from their places of work will likely persist.

London's robust economic growth, urbanisation and growing population is expected drive demand for additional transport capacity over the next three decades. London's transport stakeholders have risen to the challenge by delivering major projects such as Crossrail 1, Thameslink Programme and the Tube upgrade programme, which will provide London's residents with substantial improvements in capacity and connectivity across the network. Yet the capacity that these programmes deliver will not be sufficient to meet all of the expected demand. As London expands spatially and economically, further large-scale transport investment will be needed to deliver capacity on radial corridors that connect orbital routes to new urban employment centres while enhancing connections to the commuter hinterland. This will involve the proposed Bakerloo extension and Crossrail 2 to connect less well connected areas in the boroughs in the north, south east and south west where there exists potential for higher densities of housing and employment around transport interchanges.

As a global city, London's future competitiveness depends on being able to continue to attract and retain a high quality labour force which allows the city to sustain growth over the long-term. The cost of housing is a major challenge for London which leads to higher wage bills for employers and forces many of London's residents to move further out into the commuter hinterland to find affordable housing or migrate away from the city.

¹ Eurostat, 2015, Regional labour market statistics – GDP per person employed, NUTS2 level (2012 data)

Best-practice urban planning emphasises the importance of good public transport accessibility for the development of higher density housing. This allows residents to access their place of work within a reasonable journey time, and minimises the negative economic and environmental impacts of road congestion. Inevitably the Opportunity Areas where new homes are planned, many of which are located in outer boroughs, have lower levels of transport connectivity. To make these developments viable, London will need new high-quality rail links which connects these locations to employment centres in inner boroughs, and to ease congestion on existing routes.

Q2 - What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

CH2M's experience of evaluating and delivering some of London's largest transport infrastructure programmes informs us of the importance of closely aligning the timing of planned infrastructure improvements with strategic objectives. This involves prioritising transport projects such that their timing maximises economic benefits for the areas they serve and anticipating infrastructure requirements for the development of specific Opportunity Areas.

The Mayor's London Infrastructure Plan sets out the infrastructure projects that London will be required up to 2050 in order to sustain economic growth, maintain London's global competitiveness and provide for London's housing and employment land needs. However, a consideration for how these projects should be prioritised is not explicitly covered in the plan. Over the short to medium term, projects such as the Tube upgrade with clear benefits in terms of capacity, reliability and journey times should be prioritised, but over the longer-term this will not be sufficient to meet growing passenger demand and to relieve congestion. This is why larger scale projects such as Crossrail 2 and the Bakerloo Line Extension are being planned to deliver a step change in capacity.

Beyond providing extra capacity, further strategic and economic considerations must be taken into account. The London Plan sets out a spatial development strategy which focusses on the densification of urban centres with good transport links and the development of Opportunity Areas where there exists significant capacity to build new housing and employment space taking into account London's urban form which is bounded by a protected green belt. London's future development requires transport infrastructure with frequent, high capacity radial and orbital rail links to provide connectivity between these Opportunity Areas, to the urban core and to the commuter hinterland.

Some Opportunity Areas will develop with minimal public sector intervention while others will require substantial investment in essential infrastructure in order to be viable. This includes the Upper Lee Valley where it is recognised that a major improvement in transport accessibility via Crossrail 2 will be needed to unlock its housing potential. The Thames Gateway is another area with huge potential for residential development. However, over the years London's policy framework has not been able to unlock the full potential of the land. This points to the need for additional transport infrastructure beyond proposed schemes such as an extension of the DLR network in order to enable development in this area.

A key issue facing London in the future will be to find the space to accommodate a workforce that is expected to increase by one million over the next two decades². More people will put substantial pressure on London's already strained road network and pedestrian walkways, particularly in Central London. The historic layout of the city centre means that there is limited scope to expand road capacity. Strategy will therefore need to consider options that allow more efficient usage of existing roads, cycleway and pedestrian walkways supported by investment in smart road signalling technology and expansion of the cycle rental scheme and the cycle superhighways network.

Q3 - What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

CH2M is currently advising TfL on the business case for Crossrail 2 (CR2) which restricts our ability to provide detailed comments specifically about the costs and benefits of that scheme.

More generally, the DfT transport appraisal guidance (WebTAG) provides a robust and comprehensive framework that is comparable to the best in the world³. Recent changes have seen wider economic benefits appraised as part of the framework alongside direct transport user benefits. This represents a major step forward for the appraisal of major transport projects. However, it is acknowledged by the DfT that in some circumstances, the appraisal framework does not fully capture the economic growth impacts of transport projects⁴, particularly large projects

² GLA Economics, 2015, Updated employment projections for London by sector, Greater London Authority.

³ Mackie, P. and Worsley, T., 2013, International Comparisons of Transport Appraisal Practice, Institute for Transport Studies, University of Leeds.

⁴ Department for Transport, 2013, Understanding and Valuing the Impacts of Transport Investment, DfT.

such as HS2 and Crossrail 1 that are expected to change the economics of private investment in areas along the route, and produce regional and national level economic growth impacts.

Major transport schemes provide not just transport benefits but also support sustainable economic development, housing development and regeneration. CH2M's experience working across development and infrastructure sectors including water and energy underlines our view that it is important to adopt a holistic approach to evaluating infrastructure investment which takes into account all the transport and economic benefits of proposed schemes. These benefits are not currently quantitatively evaluated as part of the WebTAG framework but methodologies have been developed by other Government departments including DCLG for valuing the impacts of transport schemes on additional housing supply and land values. This points to the critical need for cross-departmental appraisal guidance, which follows the principles of the Green Book and the subsequent Five Case model, and importantly takes into account the various non-transport based economic externalities facilitated by transport investments.

From CH2M's own experience in delivering some of the UK's largest infrastructure projects, and reflected in DfT's 2014 commissioned report⁵ on how to extend and improve appraisal techniques in order to fully capture economic impact of transport investments, it is acknowledged that new techniques will be needed to fully account for the all economic impacts of projects such as Crossrail 2. This will involve quantifying the 'real economy' impacts of proposed interventions, covering the interactions between infrastructure, land use and spatial development. This will require using models that predict changes in land use associated with the transport intervention and the resultant uplift in land value, as well as Spatial Computable General Equilibrium (S-CGE) models, which has been used in support of our work for Lower Thames Crossing, that measure the true impact of strategic transport investments at regional and national economies.

Regarding the scheme's costs, we are of the opinion that adopting innovative contracting methods and programme management techniques, like those introduced by CH2M for delivering critical infrastructure associated with the London 2012 Olympics, could bring some efficiencies. In particular, such approaches could encourage contractors to deliver and share cost efficiencies during the delivery stage. They could also enable the programme to roll on and off the contractors responding to the changing need over different delivery phases.

Q4 - What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

CH2M is currently advising TfL on the business case for Crossrail 2 (CR2) which restricts our ability to provide details regarding the proposed funding arrangements of that scheme.

That said, the funding and financing options for Crossrail 2 have been explored in the *Funding and Financing Feasibility Study*⁶ undertaken for TfL by PwC. This includes examining the potential of using funding mechanisms employed by Crossrail 1 and Northern Line Extension (NLE). In the case of Crossrail 1, local funding was raised from a Mayoral Community Infrastructure Levy (CIL), Section 106 developer contributions, a business rates supplement for Greater London and the sale of land and property used during the delivery phase along with major contributions from Canary Wharf Development Group and Heathrow Airport Ltd. The Northern Line Extension receives funding from long-term business rate increments and a proportion of borough-level CIL and S106 receipts related to new developments in the Vauxhall Nine Elms enterprise zone.

Compared to Crossrail 1, where large sections run through the city centre, the benefits of Crossrail 2 are expected to be more broadly distributed across London's businesses, residents, transport users and the wider economy. This will mean a different funding package will be needed relative to Crossrail 1. This could include section 106 developer contributions, the extension of the Mayoral CIL and introduction of borough-level CILs to capture value uplift in areas substantially affected by the scheme. The funding package will also need to consider other options which were not possible for the Crossrail 1 funding package.

One option that would have important benefits for transport infrastructure funding would be the devolution of some taxation powers to London. London is more dependent on central government funding and has much lower levels of fiscal autonomy than other major international cities such as New York or Paris. A 2013 report commissioned by the London Finance Commission⁷ shows that London collects the lowest municipal taxes per

⁵ Laird J., Venables J. and Overman H., 2014, Transport investment and economic performance: Implications for project appraisal, DfT.

⁶ PwC, 2014, Crossrail 2 Funding and Financing Study, TfL.

⁷ University of Toronto Institute on Municipal Finance and Governance, 2013, 'International Comparison of Global City Financing', London Finance Commission.

capita amongst seven major city comparators. Only 26.2% of London's funding comes from own-source revenues compared to 82.5% in Paris. This limits London's autonomy to be able to fund and finance large-scale transport infrastructure improvements in the capital and make strategic decisions regarding investments.

Private financing has been used successfully for the Thames Tideway Tunnel using a regulated asset base model, whereby the finance costs are covered through the regulatory system. An adapted approach could be used by Crossrail 2 to secure private finance by issuing bonds which would be repaid by the Mayoral CIL and Business Rate Supplement. This would be a departure from previous rail financing mechanisms, which have involved either the DfT, GLA or TfL securing loans from public sector sources such as the Public Works Loan Board which are repaid through fares or the business rate supplement. However, a private finance approach may provide advantages through transferring a portion of the risk away from the public sector.

Capturing land value uplift attributed to improved transport accessibility in station catchment areas could provide an alternative funding stream if it can be captured through Stamp Duty Land Tax and Council Tax increments. A report by GVA⁸ predicts that Crossrail will increase residential capital values around stations on the route by between 20% and 25% up to 2021. Capturing such increases in capital values will of course be dependent on the regional devolution of powers to collect this revenue.

The current council tax system (where bands are set using 1991 property values) makes it difficult for increases in tax revenues to be captured and directed towards funding major transport infrastructure. In the Netherlands, capturing land value increments are made easier through a local property tax which is calculated as a percentage of the real (inflation adjusted) value of the property.

A further possible step would be the removal of TfL borrowing limits while retaining prudential borrowing rules. This would have the effect of improving flexibility to fund major transport schemes. Fiscal devolution could also provide financial incentives for boroughs to take difficult planning decisions, which would benefit from retaining some of the increases in tax revenues. More flexibility on borrowing limits would also allow TfL to replicate the example of MTR (Hong Kong's metro operator), which develops the assets above and around underground stations into commercial and residential schemes in coordination with city authorities. MTR uses revenues from these investments to fund the cost of expanding the metro network. In areas where Crossrail 1 stations already exist such as Tottenham Court Road, land value capture could be maximised through strategic location of station entrances. While it is acknowledged that there are substantial differences between London and Hong Kong which makes the comparison difficult, most notably the fact that all land in Hong Kong is owned by the authorities, there does exist an argument around the more effective development of TfL assets, and this could be facilitated through greater borrowing freedoms for TfL and the GLA.

Submission by the Chartered Institute of Logistics and Transport

to the

National Infrastructure Commission call for Evidence:

London's transport infrastructure

Introduction

The Chartered Institute of Logistics and Transport (“the Institute”) is a professional institution embracing all transport modes whose members are engaged in the provision of transport services for both passengers and freight, the management of logistics and the supply chain, transport planning, government and administration. Our principal concern is that transport policies and procedures should be effective and efficient, based on objective analysis of the issues and practical experience, and that good practice should be widely disseminated and adopted. The Institute has a number of specialist forums, a nationwide structure of locally based groups and a Public Policies Committee which considers the broad canvass of transport policy. This submission has been prepared by the Institute’s London and South East committees.

1 What are the major social and economic challenges facing London and its commuter hinterland over the next two to three decades?

- 1.1 Continuing population growth due to migration from other parts of the UK, Europe and beyond, increasing life expectancy and increases in younger populations.
- 1.2 Acute accommodation shortages and/or major expansion of housing stock requiring major increases in transport provision (bus and all forms of rail) to meet the demand for ever longer commuting journeys.
- 1.3 Changes to personal mobility patterns due to driverless personal transport which could have major implications for transport requirements as well as causing major difficulties for road capacity and parking provision in congested areas. NB the technology is as yet unproven and could be of little use where there is conflict with pedestrians, cyclists and other non-automated road users.
- 1.4 Changes to relationship between UK and Europe and break up of UK could have a huge effect on the viability of London and the south East which could cause either a strengthening or serious decline in the importance of London as a world

class centre. The result of the European Referendum could lead to major changes to London's importance in the world that at this stage are difficult to quantify.

1.5 Technological changes that could disperse working locations, particularly the increase in homeworking although effects of this on commuting are as yet relatively limited.

1.6 Increasing inequality, which risks resulting in options for funding transport enhancements through charges or higher fares being rejected as unfair and politically infeasible.

2 What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail, and underground – including, but not limited to Crossrail 2

2.1 The options will depend on where the increase in the housing stock and in workplaces to accommodate the projected growth in London's population and employment is to be built.

2.2 Material increase needed in road and rail capacity on a number of routes within around Greater London. Currently capacity constraints are particularly acute on lower Thames river crossings as well as a number of key trunk routes in the South East and London. Whilst alternatives to car use and road freight transport need to be constantly sought to minimise the need for road capacity expansion it has to be accepted that free commercial traffic movement on key routes is essential for local, regional and the national economy.

2.3 Improved freight capacity and facilities needed within London and wider south East to cater for population increases, changes to travel patterns brought about by technological changes, particularly the move to online ordering and delivery. Transshipment between trunk and local movements will be essential both within road transport and between sea, rail and road. Ways of increasing non-road freight route capacity need to be found which could be around rather than across London. Ways would also need to be found to attract freight operators towards routes where there is greater potential capacity as opposed to routes already seriously constrained.

2.4 Future airport and runway decisions will have a considerable impact on transport flows in South East. Consideration needs to be given to developing other airports around London for freight and passenger movements (e.g. Stansted, London City, Luton and Southend) as well as the reopening of Manston, which could reduce traffic movements in critical areas of the road network. Building up some of these airports would also help strengthen local economies by improving local connectivity and job creation.

2.5 Greater use of River Thames and canal systems in and around London needs to be considered including what improvements to infrastructure are needed to make best use of these resources. The Thames can be used for passenger as well as freight flows. NB Wharfage has to be protected from high end housing schemes to allow future developments to happen.

2.6 Improvements to public transport in the areas outside the London boundaries would improve local connectivity and reduce car dependency which would reduce pressure on road and rail infrastructure within Greater London (See Section 6 below).

How should they be prioritised, taking into account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

What might their potential impact be on employment, productivity and housing supply in London and the South East?

2.7 Assuming that the current demographic and employment trends continue housing supply throughout the south East will need to grow considerably although a change to London's economic performance could slow this down or even reverse the requirement although population increases are likely even if the economy weakens considerably

2.8 Automation and homeworking could reduce the pressure within London and encourage more people to live further out. They would also materially affect the transport network and future assumptions regarding network capacity.

2.9 Unless there is increased public and private investment there will be a considerable housing shortage for the foreseeable future

2.10 Both Transport for London and the Department for Transport have well-established decision-making processes set out in the respective organisation's Transport Business Case. Priorities should continue to be determined against these criteria.

3 What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme

3.1 Integrate as much as possible with existing rail infrastructure and any disused rail corridors still extant to minimize construction costs

4 What are the options for the funding, financing and delivery of large-scale Transport Infrastructure improvements in London, including Crossrail 2

- What is the appropriate local and regional contribution- given the potential distribution of benefits to business, residents, transport users and the wider economy- and how could this be achieved?

4.1 Better cooperation and integration of planning, infrastructure, housing etc. between Greater London and surrounding authorities (as per City Regions in rest of UK). Also closer working between the authorities outside Greater London.

- What innovative funding mechanisms could be considered to support delivery of key schemes?

4.2 Regional/local taxation

4.3 Road user charging and expansion of congestion charge – This will be vital if automated personal transport takes off

4.4 More effective use of developer contributions which could include a levy on developers in addition to or as an alternative to the current mixture of measures, some of which encourage wasteful spending by developers.

5 How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there lessons to be learned and applied in London?

5.1 Do European and other major Regional Transport Authorities provide a model for London to follow or does the London model work just as well?

5.2 Highway planning and management and bus services are dealt with differently outside the TfL area which inevitably constrains development. Funding in Shire and unitary areas is seriously constrained and getting ever more so year by year. This needs to be reviewed and changed if necessary.

5.3 UK Transport policy is based on the premise of maximising farebox contribution (usually involving annual fares increases at above-inflation rates) which is not the case in many other countries, particularly in Europe. The benefit of minimising subsidy against the extra capacity that would be required to accommodate demand from greater support levels needs to be reviewed and whether the provision of greater passenger transport capacity at more affordable fare levels and resulting increased usage would free up alternative road capacity for freight movement. There is also an affordability issue for lower paid workers who are paying a larger proportion of their income on transport in London than in major cities outside the UK.

6 General Comments and Points for Consideration

- 6.1 Clarity is needed on what constitutes London and what constitutes the south East and how far away from London the review should consider. For example improved transport links between Oxford and Cambridge, East Coast ports and the Midlands, along the south coast and between Kent and the Crawley/Gatwick/South London areas could all reduce vehicle and passenger movements into and out of London. What is good for London may not be good for the South East as a whole and vice versa. Transport needs, funding, provision, infrastructure and charging regimes should be less constrained by political boundaries. If current population trends and housing supply constraints continue people will continue to migrate outwards from London although transport affordability and in many areas, availability, raises a constraint to such outward migration as does an overloaded road and rail network.
- 6.2 Relative employment opportunities between London and the South East need to be considered as a whole with a view to spreading benefits to reduce the effects of overheating on the London economy and strengthening other economies that have suffered severe decline (e.g. south eastern seaside communities). This also needs to take into account the economies of regions throughout the UK and particularly within the northern super-region i.e. joined up thinking is essential for the UK as a whole.
- 6.3 Spending money on improved infrastructure in the South east may be more effective and deliverable as well as cheaper than directing the lion's share of expenditure into the Greater London area.
- 6.4 More clarity is needed as well as consistency within the region on what the priorities for transport related expenditure should be e.g.;
- Public v private transport and the role of cyclists and pedestrians
 - Passenger v. freight
 - The level of constraint on demand and desire for sustainable transport options
 - Road v rail and water
 - Airport capacity and locations
- 6.5 Other infrastructure considerations that have to be considered include;
- Funding the effects of climate related issues including coastal erosion from extreme weather (the current closure of the rail link between Dover and Folkestone is an example) or the loss of bridges, road damage etc. from flooding. These problems appear to be increasing due to the effects of global warming.

- The potential to damage to transport or other subterranean structures as a result of the increasing amount of below-ground building to provide additional residential capacity by building down rather than extending upwards which would be unlikely to receive planning permission. Planning regulations are probably the solution to this issue.

6.6 Overall Connectivity both within the South East and Beyond

- A high proportion of total transport movements between the UK and Europe travel through South east England and Kent in particular. As was seen in summer 2015 these movements are prone to major disruption whether due to industrial action, security issues or severe weather in the English Channel. Adequate capacity for freight transport to and from Europe is essential, particularly parking and driver rest facilities as well as provision of improved terminal facilities at other ports to allow for use by large ships when problems arise at the regularly used ports. Strengthening of rail capacity to the channel tunnel and ports is also needed (including around London to encourage trunk movements from the rest of the UK) to reduce the dependency on road networks. Continued development of North Sea and Thames Estuary ports with improved rail links should also be encouraged.
- As already alluded to outside the Greater London area public transport provision is generally to a much lower level, particularly on the majority of routes that are not rail-linked. Bus services are generally infrequent outside urban areas and often non-existent outside the core Monday to Saturday daytime period. The bus network (as well as the local charging regime) is almost entirely designed around what the commercial operators deem to be profitable that may or may not be the optimum network for a particular area and provision levels can vary considerably between comparable areas and bus operator groups. The road network is generally full to capacity at busy periods, Funding within non-metropolitan areas has been to traditionally lower levels than in London and is declining annually at an alarming level. If the current culture of car-dependency with its consequent resulting in an inefficient and environmentally questionable transport network is to be tackled a rethink is needed on how South Eastern England's transport network is funded and managed and how the planning system could be improved to reduce conflicting travel flows. The alternative will be a declining local economy due to the difficulty of moving freight and people around the South east and increasing inequality of movement for those without easy access to private transport.

- Regardless of London the South East is a very diverse area economically and demographically. There are a limited number of large cities but some major conurbations covering wide areas including the Brighton/Hove/Worthing conurbation, the Medway Towns, the South Thames side area, the Crawley/Gatwick/Redhill area and further afield the Solent area conurbation that includes Portsmouth, Southampton, Eastleigh, Fareham and surrounding areas. Transport links in and to and from these areas are in most cases poor when compared with comparable areas in other parts of the country as well as being heavily congested.

6.7 Whatever changes are made to discourage unnecessary movements within the Greater London area a balance has to be struck between the core London economy and the economies of the wider South East (and beyond). Evidence has been found (and which has been used to make the case for Crossrail 2) that productivity is higher in central London than elsewhere, even when differences in skills etc. are accounted for and concentrating high value employment in high cost areas generates income and revenue to fund the level of infrastructure needed in central London which would be unlikely to be justifiable anywhere else. Therefore a balance has to be struck between the differing economies in different areas. i.e. there is a need for joined up thinking that crosses political boundaries, business sectors, vested interests etc. that leads to decisions that benefit the UK as a whole as well as both London and the outer South east.

January 2016

National Infrastructure Commission call for evidence, November 2015

**Memorandum from the City of London Corporation
Response to Question 3: London's transport infrastructure**

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The City of London Corporation is committed to supporting and promoting the case for enhanced transport infrastructure, particularly in relation to rail services. As London's population grows and as the challenges of maintaining the Capital's status as a global city increase, a continuing programme of improvements will be needed to reduce congestion and free up capacity on rail routes serving the City of London and provide a stimulus to employment and housing growth in the London area.

The provision of adequate transportation infrastructure to cater for London's growing population and expanding employment base will continue to be a major challenge for the foreseeable future. Strong employment growth is already happening in the City of London; the City's local employment market is strong and total employment increased from 344,000 in 2008 to 414,000 in 2014. This is consistent with the aims of the London Plan 2015 and the City of London Local Plan 2015 which are both planning for significant office and employment growth and modest housing growth in the City of London by 2026. The range of office occupiers has broadened in recent years from its financial services base so that the City is now seen as an attractive business location for a wide range of companies. However, maintaining the City's competitive position as the world's foremost international business and finance centre is heavily dependent upon good transport links both within London and its commuter hinterland. In addition, the urgent requirement for additional housing in the London area will also increase the need for improved transport links between the suburbs and the central business district.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Although various important transport projects, such as Thameslink and Crossrail, are under way, the legacy of many years' under-investment in the Underground and National Rail means that the additional capacity provided by these projects is likely to be fully utilised shortly after they open. Thus a continuing programme of rail capacity enhancements is required with a particular focus on improving the accessibility of areas with potential for major housing development such as the Lea Valley, Ebbsfleet, Barking Reach in the east and Old Oak Common in the west. Additionally from a business perspective there is a need to improve rail links to London's airports.

The City Corporation's priorities include:

Crossrail - This project will significantly improve east-west rail connections across London but the proposed train service pattern does not make full use of the new infrastructure, as a significant proportion of trains from the east will not travel beyond Paddington. The following measures are therefore recommended in order to maximise the value of the project:

- Extension of Paddington terminating trains to Tring/Milton Keynes on the West Coast Main Line via a new connecting line at Old Oak Common. This improves utilisation of the Crossrail tunnels, improves accessibility of the Old Oak regeneration area, provides new direct links to the West End and the City for commuters from north-west London and beyond and reduces the number of trains terminating at Euston (thus releasing capacity for HS2 and other services).
- Extension of Crossrail from Abbey Wood to Ebbsfleet and Gravesend to facilitate housing development in North Kent, particularly the development of Ebbsfleet Garden City.
- Provision of a direct fast Crossrail service between Heathrow T5, central London and Canary Wharf. Current proposals only provide for a stopping service between Heathrow T4 and central London which will not meet the requirements of many business travelers. This may require the amalgamation of Heathrow Express services into Crossrail.

West Anglia Main Line – Four-tracking the West Anglia Main Line is a key priority as it will allow a significant increase in capacity by separating fast and stopping services on this congested corridor. This will meet the long overdue need for faster and more frequent services to Stansted Airport and Cambridge and allow the provision of enhanced commuter services which will open up the potential for significant housing development around stations in the Lea Valley regeneration zone. Four-tracking is a necessary precursor to the future extension of Crossrail 2 services beyond Tottenham Hale.

Crossrail 2 - Although Crossrail 2 does not serve the City of London directly, it will boost the capacity and resilience of the central London public transport network and help to relieve overcrowding on key rail and Underground routes which do serve the City. This in turn will increase the attractiveness of the City and help to maintain its position as the world's leading financial and business centre. The key benefits for the City are:

- a reduction in severe overcrowding on Northern line;
- relief of congestion on suburban services into Waterloo;
- relief of congestion on suburban services into Liverpool Street;
- release of capacity at Liverpool Street through the diversion of some West Anglia suburban services onto Crossrail 2 which will allow enhancement of other services, such as those to/from Stansted Airport;
- release of capacity at Waterloo through the diversion of some South West suburban services onto Crossrail 2 which will allow enhancement of longer distance services, such as those to Woking, Guildford etc.;

- potential relief of crowding on the Central line if the future Eastern branch of Crossrail 2 is pursued:
- a significant improvement in accessibility for neighbouring Hackney and the Upper Lee Valley which will assist with regeneration and housing growth.

London Overground – TfL's proposal to extend the Gospel Oak-Barking Line to serve Barking Reach is supported as a means of opening up this area for much-needed housing development.

London Underground – It is essential that there is continued investment in upgrading the London Underground network. Passenger numbers are at an all-time high and look set to grow further, so it is very disappointing that some planned improvements, such as the re-signaling of the sub-surface lines, have been seriously delayed. The following are key priorities:

- Bank Station Capacity Upgrade - Transport & Works Act powers were granted in 2015 and implementation now needs to be expedited to deal with critical congestion problems at this key interchange.
- Sub-surface re-signaling – urgently needed to increase capacity on the Circle, District, Hammersmith & City and Metropolitan Lines.
- Extension of the Bakerloo Line to Hayes to improve accessibility of south-east London and release capacity on National Rail routes into London Bridge.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The main opportunity to increase the benefits of Crossrail 2 is the proposed Eastern extension which will open up opportunities for regeneration in East London and help to relieve overcrowding on the Central Line and National Rail routes serving Liverpool Street.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

As has been seen with the Jubilee Line Extension and Crossrail, land and property values raise in expectation of future transport enhancements. There must be close coordination between the GLA, TfL, London Boroughs and other planning authorities outside of Greater London to ensure that planning policy is coordinated to maximise the benefits arising from infrastructure improvements.

To make sure that the benefits of future transport improvements are captured there needs to be an early comprehensive assessment of current land values, which should then be used to capture increases and recoup some of the uplift. The private sector should be expected to provide significant funding as businesses will directly benefit from such infrastructure improvements.

A key issue is to ensure that funding arrangements give the private sector certainty about their levels of contribution. In addition planning authorities need to develop policies (for example, in relation to social infrastructure and affordable housing contributions) which reflect changes in accessibility brought about by transport improvements.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

No comment

CECA Consultation Response

Civil Engineering Contractors
Association
1 Birdcage Walk
London
SW1H 9JJ

National Infrastructure Commission
1 Horse Guards Road
London
SW1A 2HQ

8 January 2016

Dear Sir/Madam

[National Infrastructure Commission call for evidence](#)

1. The Civil Engineering Contractors Association (CECA) welcomes the opportunity to respond to the above named consultation.
2. CECA provides the voice for those companies large and small who create, improve and maintain the UK's vital transport and utility networks. Our membership of more than 300 companies together delivers an estimated 70-80 per cent of all infrastructure construction work carried out nationwide. Our industry supports the employment of around 200,000 people with annual output of up to £25 billion.
3. We have long argued that the development of infrastructure in the UK has lacked long-term strategy. This has meant that large projects such as Crossrail and High Speed 1 have taken far too long to develop and build. Today, the delays we continue to see in solving the problems of airport capacity reflect this challenge.
4. Delays damage the construction industry's confidence in national infrastructure planning, resulting in lower investment in innovation and training within the industry.

The National Infrastructure Commission

5. CECA therefore welcomed the news in October 2015 that Chancellor George Osborne would establish an independent infrastructure Commission to help Government plan for the long-term. This is a policy change we discussed in our 2014 policy document, *The Infrastructure Decade*. It was also a recommendation of *Securing our Economy: the Case for Infrastructure*, CECA's joint report with the Centre for Economic and Business Research in 2013.
6. We anticipate that the new Commission will be given real authority to assess and make proposals for long-term major infrastructure projects alongside its development of innovative solutions to fund these infrastructure requirements.
7. In our view, the Commission should build on the existing National Infrastructure Plan to provide an overarching national infrastructure policy framework, linking to all Government departments and major stakeholders, helping to align strategies.
8. The new Commission must be empowered to become a truly independent expert body with a clear long-term role. This would give the construction industry, the business community and the wider public confidence in the direction of UK infrastructure for the long-term.
9. We recognise that the Commission has been established to advise on infrastructure, rather than to make decisions. It is appropriate that the final decision on matters related to strategically important infrastructure issues rests with those who have been given a democratic mandate to do so.
10. However, we also recognise that the credibility of the Commission, and its potential to build confidence in the long-term future of the UK's infrastructure planning, will be strongly linked to how the Government of the day responds to any advice that it provides.
11. As such, we would have concerns if the Commission's advice is not typically accepted and acted upon. Were this to be the case, there is a risk that the Commission would actually serve merely to perpetuate and amplify the political challenges that it has been established to help cut through.
12. **We anticipate that the Commission will prepare an annual report of its activities. We recommend that this report provides an item-by-item overview of the advice that has been provided to government, along with a RAG rating of whether that advice has been implemented in part or in full. This will allow stakeholders to have visibility of the Commission's views on whether its advice is being taken up.**

CECA response to the Call for Evidence

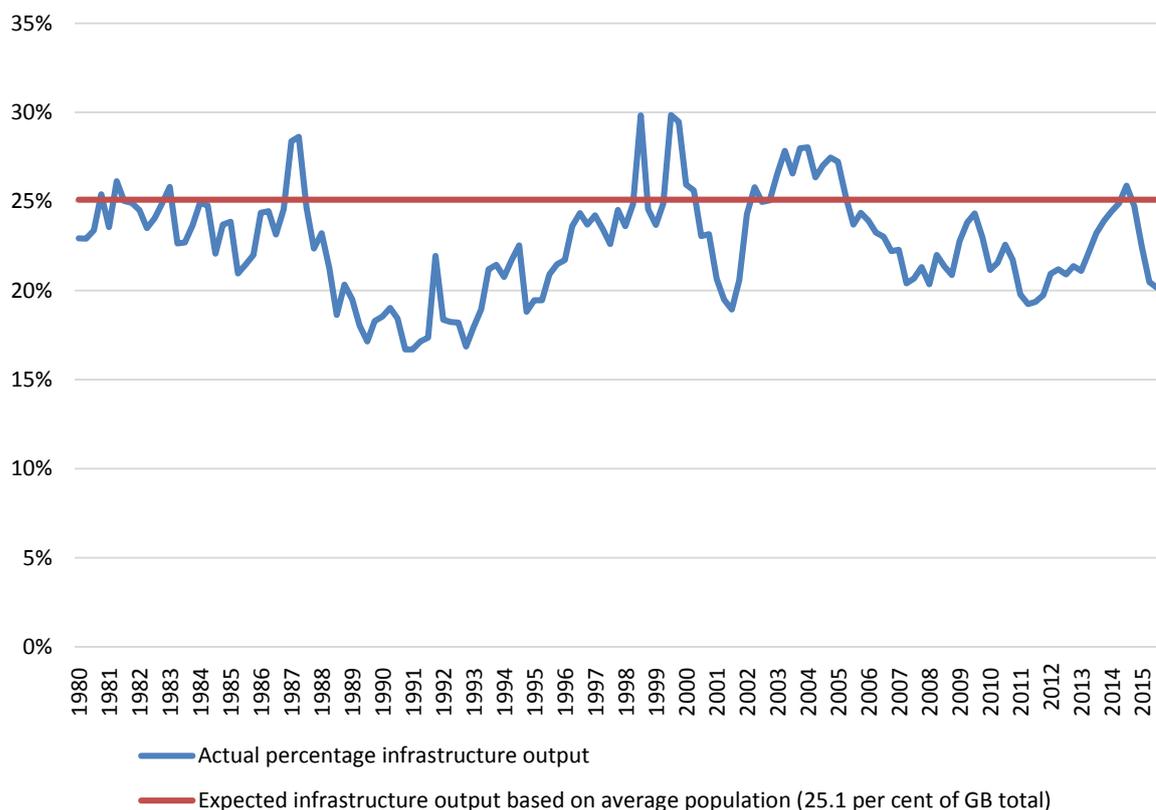

13. Much of the Call for Evidence focusses on issues related to strategic planning for infrastructure. While our members have an interest in these issues, we do not collect evidence that would be useful to support the Commission in these areas. As such, we have limited our initial response to those areas where we feel we can provide useful views from industry.

Improving connectivity between cities in the North of England

14. Our members have a dual interest in the issues of connectivity in the North of England. Members of our regional associations in North East, North West and Yorkshire & Humberside not only deliver an estimated 70 per cent of all transport infrastructure construction work in the North of England, but are also extensive users of the networks. As such, they have extensive experience of the challenges of connectivity between northern cities.

15. These companies recognise that the North of England has historically seen a lower level of investment in its infrastructure than elsewhere in the UK. The difference is particularly acute when comparing investment in northern England with that in the South East and London.

Northern infrastructure output as percentage of GB infrastructure output

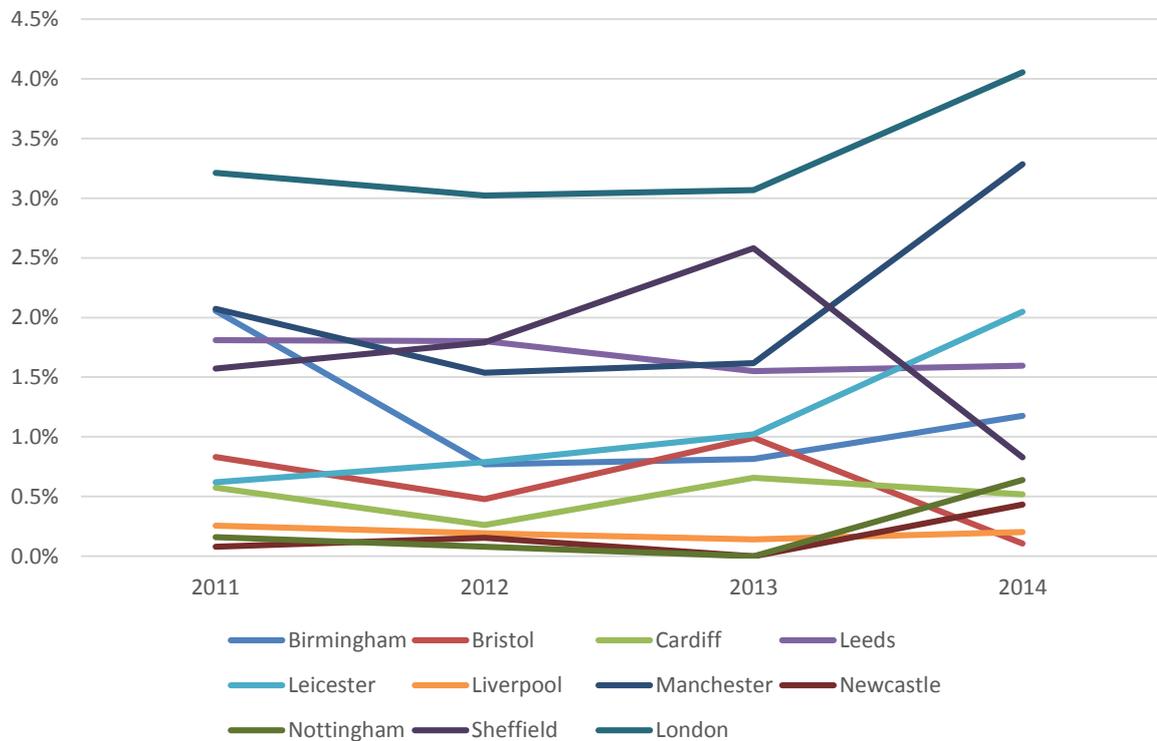

16. The graph on the previous page illustrates this issue. It shows that since the Office of National Statistics started collecting output figures for infrastructure in 1980, regional breakdown of the data shows that the North of England (North East, North West and Yorkshire & Humberside) has largely seen lower levels of output in infrastructure than would be expected based on its 25.1 per cent average share of the GB population.
17. There are many strong arguments why this may be the case. While many of the UK's largest cities are in the North, the most populous regions of the UK are the South East and London. This large and growing population creates additional pressure on infrastructure networks, necessitating investment to maintain network capacity and availability.
18. We see evidence of this in the levels of congestion on roads in London and the South East compared with the rest of the country. According to Department for Transport figures¹, 17 of the 20 local authority areas with the greatest delays due to congestion are in London and the South East.
19. Similarly, official figures² show that London experiences more overcrowding on its trains than any of the northern cities (although the most recent figures for Manchester suggest that it is starting to experience similar levels of congestion).

¹ Department for Transport - *Average journey times during the weekday morning peak on locally managed 'A' roads: by local authority in England, annual averages from 2006/07*

² Department for Transport - *Passengers in excess of capacity (PiXC) on a typical autumn weekday by city: annual from 2011*

Passengers in excess of capacity on a typical autumn weekday by city: annual from 2011

20. The economic geography of the UK also means that the business cases for investment in London and the South East are stronger, as assessments are built (in part) on the basis of economic impacts of investment on business users and private sector providers. The higher economic output of London and the South East therefore strengthens the economic case for investment as 'higher value' impacts will be achieved.
21. However, these factors create a self-sustaining vicious circle, with investment in housing and industry 'sticking' in London and the South East. This creates a more unstable economy in the region with rising population and increasingly costly infrastructure to mitigate the congestion this creates.
22. As we will discuss later in this paper, we do not believe that the response to this should be to transfer transport investment away from London. The factors that underpin London's rapidly rising population will take time to resolve, and it would be dangerous to remove the investment that ensures that the capital's transport networks can continue to function.
23. But we equally recognise that some of the pressure on London could be relieved if cities outside London, including those in northern England, offered the factors that currently attract people and investors to London. In doing so, they could draw people away from London, while stimulating more balanced economic growth across the country.
24. It is very clear that appropriate investment in transport is one of the most effective mechanisms to boost economic activity in a region. Our report *Securing our Economy: the Case for Infrastructure* found that for each £1 billion increase in infrastructure investment, UK-wide GDP increases by a total £1.299 billion. Furthermore, for every

£1 billion of infrastructure construction increases overall economic activity by £2.842 billion.

25. Importantly, investment in infrastructure boosts job creation. The same report found that for every 100 jobs created during the construction of infrastructure, a total of 305 jobs are created in the economy as a whole. There is also strong evidence of a link between infrastructure investment and the development of new housing.
26. **For the above reasons, we believe that the Commission may wish to consider whether future transport investment appraisal may put additional weight on the ‘rebalancing’ impacts that can be achieved through investment outside London. This should not be seen as a political fix to move investment towards the North (although it may drive a ‘fairer’ balance of investment across the country in the future). Instead, it is a way to give greater recognition to the rising costs to the wider UK of an overheating economy in London and the South East, while still expecting each project to demonstrate the value that it creates.**
27. We believe that part of the challenge for the northern cities in terms of their ability to present credible cases for transport investment arises as a result of a lack of coordination. Historically these cities have tended to compete for resources rather than collaborate effectively. As such, they have not had the ‘firepower’ to present a consistent vision for their needs, in a way that London has been able to.

28. For this reason, we have welcomed the development of Transport for the North (TfN). We believe that it has the potential to develop a credible vision for the future of transport in, and between, the major cities of northern England. If it functions effectively, it should be the best positioned body to analyse and determine what the most appropriate major transport interventions should be across the North of England, and build a credible case for how they should be delivered. But in order to do so, it is vital the TfN is provided with the appropriate level of resources to discharge this role.
29. To this end we would wish to see strong leadership and authority from the newly established TfN. Clarity must be given as soon as possible on the role of TfN and how it will interact with other regional transport bodies including Transport for Greater Manchester in this work.
30. Part of this work will necessitate TfN to consider how future investment will be funded. While we would anticipate that existing funding streams would continue or be replaced, this will not be sufficient to cover the full cost of delivering the TfN vision.
31. To ensure that resource constraints do not hold back delivery of this vision, we believe that TfN should build on the successful funding model for Crossrail. The large scale of Crossrail meant that it could dig deeper into who the beneficiaries were for the project, and therefore more closely tie the funding for the work to those who would see the greatest benefit. As a result, Crossrail's funding was drawn from a wide range of stakeholders including major companies (Heathrow, Berkeley Homes), wider industry (Business Rate Supplement), and the tax payer (DfT and GLA/TfL) with each paying a fair contribution based on the benefits they would realise from the project.
- 32. As such, we recommend that TfN be given the freedom to consider a programme-level 'northern transport deal' that would look at the full range of beneficiaries from the plans, developing a mechanism that seeks contributions based on all stakeholders making a fair contribution based on the benefits that they will see from the programme being delivered. This model will also have the additional benefit of confirming the support of the population of the North of England for TfN's plans.**
33. CECA members are increasingly concerned about the deterioration of local roads in northern England due to decreasing local maintenance spend. The majority of vehicle journeys begin on local roads, and it is vital that these too are well maintained to ensure efficient journeys across national networks. There is an ever increasing backlog of local maintenance work which we believe must trigger an urgent rethink of the way repairs are funded.
34. To ensure there is enough money for highways maintenance alongside other major infrastructure projects, we propose wider use of prudential borrowing, while consideration should also be given to private finance models and the targeted use of local authority reserves.
35. We also feel that there are lessons from the water sector's transition from CAPEX to TOTEX spend, with greater consideration of the best way to invest to achieve outcomes, rather than purely looking at capital solutions.

London's transport infrastructure

36. As noted in our response above, we see transport congestion as a fundamental and enduring challenge to the future of London. This is not only a problem of London's future but one of its present, with increasing challenges associated with the use of the capital's road and rail networks. Already some of London's stations are overcrowded to the point that they are not accessible at certain times during the day, while commuters are unable to board some trains into the city at peak times. The capital's roads congestion is not only the worst in the UK, but is also higher than any other city in Europe³.
37. For this reason, as noted above, we believe that there needs to be a twin approach to resolving these issues. The first priority must be to ensure that demand continues to be met. This will require sustained investment in all of London's transport networks. However we also see the need to develop a strategic approach to divert population growth away from the capital by presenting viable opportunities elsewhere in the UK.
38. **We recommend that the Commission seeks evidence of the factors that are underpinning London's continuing economic growth. This evidence should then be analysed to consider how these factors might be replicated elsewhere, while using appropriate demand management to ensure that London's future population growth is better matched to its ability to respond.**
39. When looking at the specific large scale transport improvements that are required in London, we believe that decisions on which options to take forward should be based on which will deliver the best outcomes for London and the UK as a whole.
40. On this basis, the case for the delivery of Crossrail 2 seems very strong. The route targets an alignment that will tackle some of the most pressing congestion hotspots on the existing rail network, while also opening up significant tracts of land in north east London for the development of the housing that will be required to meet London's growing population, even if efforts to divert some population growth away from the capital are successful.
41. While recognising that the project will require significant upfront development funding, we understand that Transport for London forecasts that delivery of the project will largely pay for itself through a similar funding model to Crossrail, with those in the capital who will benefit from the project being asked to contribute towards its cost.
42. Through the recent/current delivery of Crossrail, Thames Tideway Tunnel and Northern Line Extension, London has developed a sustained pipeline of major tunnelling projects with continuity of workload for the sector. We anticipate that this pipeline will extend into the near future with works to deliver HS2 and the Silvertown Crossing.
43. However, there is a risk that the expertise that has built up in the UK may be lost if Crossrail 2 does not proceed. This would have negative consequences for the UK's

³ Europe's most congested cities in 2014 (ranked by annual hours wasted):
<http://inrix.com/press/scorecard-report-united-kingdom/>

ability to sustain this trained workforce to efficiently deliver other future tunnelling projects.

44. We also believe that there are significant opportunities to increase the benefits and reduce the costs Crossrail 2. Experience from many previous large infrastructure projects shows that many of the opportunities for efficiency and additional benefit are constrained due to decisions made at the earliest stages of development. Choices around the route, access and broad construction methodology tend to be taken early in the project life cycle, yet these can have significant downstream impact.
45. The companies who are involved in the delivery of infrastructure will tend to have the best understanding of where these opportunities lie. However, the pressures of existing procurement regulation mean that project developers often find it difficult to engage suppliers early to seek advice, for fear of falling foul of rules intended to avoid later conflicts of interest.
46. We believe that the revised EU procurement regulations give greater clarity that such early engagement is acceptable, with appropriate safeguards.
47. **As such, we believe that Crossrail 2 should be used as an exemplar of what can be achieved by appropriate early involvement of the supply chain in the development phase. Our engagement with members indicate that such activity could reasonably be expected to deliver at least 20 per cent savings against typical costs for a more traditional approach.**
48. We believe that this engagement could be achieved through ‘ultra-early’ appointment of suppliers to work on the scheme right through from early development through to delivery. However, recognising that this may be perceived as closing out options for competition for the delivery phase, we also see options for appointing an independent panel of advisors, drawn from industry, who would provide buildability advice to Crossrail 2 Ltd. Such advisors could be appointed from a panel of volunteers that would be seconded from industry, selected for their specific expertise around a given issue, and paid on a consultancy basis via a standalone body to remove any issues around conflict of interest. This would allow Crossrail 2 Ltd to benefit from the insight that could release the cost savings outlined above, while avoiding any concerns that advice from individual supply chain companies could see those companies barred from bidding for future work.

**Community
Transport
Association**

Response to the

National Infrastructure Commission Call for Evidence

Closing Date: 08/01/2016

The Community Transport Association

The Community Transport Association

The Community Transport Association is the national body working with the providers of community transport helping them to remain relevant and responsive to key areas of public policy and make a big difference for people and families in the communities they work in. These are typically charities and voluntary groups rooted in their own local community.

The CTA is the UK's leading authority on the practice and performance of the UK's community transport sector and uses its research to gather insights and intelligence from local communities to inform the development of public policy.

We are for, and about, accessible and inclusive transport.

We work with people who all want the very best for their communities and see accessible and inclusive transport as part of the answer to the big questions about how we are all to live, learn, work, participate and belong.

We work for a better world where individuals are able to design their own ground-up transport solutions, placing accessibility and inclusivity centre-stage in a way that nobody else ever has.

Community transport

In all parts of the UK, on every day of the year - including Christmas Day – thousands of community transport staff and volunteers are helping people to stay independent, participate in their communities and to access vital services and employment.

Community transport is about providing flexible and accessible community-led solutions in response to unmet local transport needs, and often represents the only means of transport for many vulnerable and isolated people. Significant user groups are older people and disabled people.

Using everything from mopeds to minibuses, typical services include voluntary car schemes, community bus services, school transport, hospital transport, dial-a-ride, wheels to work and group hire services. Most services are demand-responsive, taking people from door to door, but a growing number are offering scheduled services along fixed routes where conventional bus services are not available, especially in rural areas.

As community transport works to a different business model to commercial passenger transport services - i.e. it is always run for a social purpose and community benefit, but never for a profit - it often a more reliable and resilient way of ensuring a broader range of transport needs can be met.

Whilst the journeys community transport delivers account for a small proportion of the total passenger journeys made every year by the public, their significance in improving the lives of the people who use these services is remarkable.

CTA's Response to the Consultation

The CTA welcomes the opportunity to contribute to the Infrastructure Commission consultation process.

Community transport in all its forms, has the potential to offer a more reliable and resilient way of addressing a growing number of transport needs and accessibility issues. The possibilities are immense. Services that are needs-led, community-run, not-for profit, highly collaborative with high levels of volunteer involvement are all getting a good hearing in the debates about building better and more sustainable transport which is accessible and inclusive. It makes sense that the Infrastructure Commission should also want to hear about and consider the contribution of this vital, but often low-profile, part of the transport network.

In responding to the Commission we have structured our response around the relevant questions in the consultation document. Where possible footnotes are provided that point to further evidence for consideration. This response refers to the heading "For future investment in the north's transport infrastructure." In addition we have also made some general comments in relation to section 3 on London's Transport Infrastructure which mirror some of our conclusions on the role of community transport in connecting northern cities.

To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?

Weaknesses in transport connectivity

- 1 Different stakeholders will view 'weaknesses' through different lenses. At the Community Transport Association we believe transport systems are weaker when:
- 2 The needs of vulnerable and isolated people and communities have not been at the forefront when public services and infrastructure have been designed. This includes older people, disabled people, those with long-term conditions, those living in social isolation and those who cannot access employment, education or training.
- 3 The system focusses solely on private car use and mainstream public transport and does not recognise and include activity from the ground up - community-led transport solutions and the local sharing economy. Not owning a car should not be a barrier to achievement or aspiration.
- 4 The result of these weaknesses is poor integration across and within different modes of transport with a lack of connectivity which, amongst other things, does not reconcile unused capacity with unmet needs.
- 5 The CTA's vision is of a more integrated transport network built from the ground up. The CTA believes the UK Government deserves a good hearing on its ideas for devolving more decisions about local transport and we welcome the moves by transport authorities and public bodies across the north to embrace the opportunities this may present.
- 6 However, we also know that many organisations are finding it hard to listen when faced with the reality of cuts to local government funding. The impact on the number and reach of bus services as a result of reductions in public spending have been well documented by organisations such as the Campaign for Better Transport.
- 7 As good transport links have a demonstrably positive link with employment we are worried that poor bus infrastructure will prevent many communities, particularly those in rural areas, from both supporting, and benefiting from economic growth. It is usually poorer people who are the most dependent on bus travel. Therefore there is a real danger that social isolation could quickly be translated into economic isolation for people who live in northern rural communities. Furthermore, as job seekers are dependent on effective infrastructure we believe that transport connectivity is vital for encouraging economic growth within northern city regions.

Social and economic benefits of community transport

- 8 We believe the social and economic benefits of community transport means that community transport should be considered integral to the debate about on how connectivity can drive economic growth.
- 9 Many community transport operators support local businesses through enabling people to access retail and other services on the high street. New research published in January 2016 estimated that for every pound invested by Devon County Council on community transport; almost £9 is spent in the local economy; with community transport services users spending an estimated £2.2 million in Devon high streets each year.
- 10 Councillor Stuart Hughes, Devon County Council Cabinet Member for Highway Management, in welcoming these figures said “Community transport is extremely important in Devon in helping people to maintain their independence and continue living at home. It provides a lifeline to those who may otherwise be isolated and, as these figures show, it is also important in supporting the local economy. Community transport... helps people who find it hard to get around to access their local shops and other services. The benefits to our local market and coastal towns are clear, and the success of community transport is thanks to the dedicated staff and volunteers.”
- 11 Community transport operators provide direct employment and opportunities for volunteers, which can enhance their chances of entering employment and reducing social security costs. Volunteers within community transport also benefit from social interaction that they may not otherwise get and provide a net economic benefit to society when the value of their time and contribution is monetised.
- 12 Poor access to private and public transport is a common labour market barrier for many young people. Community transport operators help them through initiatives such as Wheels to Work. South Yorkshire Wheels to Work has helped more than 500 people over three years to get to work, training or college through lending them a scooter and safety equipment and providing them with training.
- 13 Another example of a bespoke local service that addresses labour market barriers was set up by Ilfracombe and District Community Transport from Job Centre Plus. Local employers in the hospitality sector were having difficulty recruiting due to the lack of public transport in the evening. The community transport operator set up a late night minibus service running seven nights a week, picking up from several premises in the local area in order to take employees back to their homes in Ilfracombe.
- 14 In addition to investment in community leading to economic growth and job creation it can also lead to savings being made to the public purse by reducing spend in other areas.

- 15 Community transport services are of significant importance in supporting personal independence and tackling isolation. By supporting people to access vital services and social networks they enable them to stay in their own home which reduces the likelihood that they will need more costly publicly-funded care.
- 16 Community transport offers a wide range of benefits to local authorities and other public bodies. They are often less costly than their commercial equivalents and offer alternative solutions when conventional and subsidised bus services are withdrawn or are not viable, especially in rural communities.
- 17 Community transport operators will also often create value for some public services that have not had to make a financial contribution to receive those benefits. An example is in health, where the CTA survey of operators in England in 2014 found that 74 per cent of operators were enabling people to access health services, but only 24 per cent received any funding from the health bodies benefiting from this.

Improving transport connectivity

18. In improving transport connectivity within city regions we believe a number of actions regarding infrastructure are necessary. The first is that we believe local people should be given a greater role in shaping local transport that works for them. It is our belief that local infrastructure can only be improved through giving local authorities the power to develop integrated transport systems that include community transport from the outset. We believe that more has to be done to encourage more collaboration between the private sector and community transport operators, as a lack of collaboration leads to poor connectivity, inefficiencies and underused capacity in the system. We would contend that even though many mainstream public transport services have improved their inclusivity and accessibility in a meaningful and measurable way attention still needs to be given to all parts of the door to door journey. If people cannot get from their front door to the accessible train station because the first part of their journey cannot be made then the high profile measures taken to improve accessibility in public transport will not have fulfilled their promise or potential.
19. Looking at connectivity between northern city regions we know that poor access to private and public transport is a common market barrier for many young people. It has to be a particular concern that local authority cuts may make it impossible to simultaneously build affordable housing, and support effective transport, further decreasing mobility for many people. Community transport operations have a positive economic impact on city regions¹, and we believe that for this benefit to be felt between city regions it is necessary to consider how transport is regulated between city regions. We believe that regulation

¹<http://www.ctauk.org/UserFiles/Documents/In%20Your%20Area/England/State%20of%20the%20Sector%20for%20inhouse%20print.pdf>

needs to be proportionate to better recognise providers who work across town and city borders.

20. Fundamentally, capital infrastructure investment needs to ensure passengers are able to traverse the transport network by a range of different transport modes. Key to achieving this is investment in an intergraded transport system that uses accessible and integrated information technologies. Furthermore, any capital investment in infrastructure needs a revenue commitment to underwrite it, as Local Authorities continue to reduce bus subsidies this is likely to necessitate the need for partnerships with external transport providers.

What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.

21. In developing city-to-city connectivity we believe it is right that the commission looks at transport holistically, rather than individual services. It is our belief that it is necessary to significantly invest in public transport solutions that incorporate passenger preferences toward multi-modal, and integrated transport solutions. As transport consultants Frost and Sullivan point out this vision of increased public transport use is:

22. “realised by a convergence of four main mega trends that are being continually tracked by Frost & Sullivan research teams – urbanisation leading to an increasing population density and potential for new mobility business models, social preference changes, rapidly advancing technological developments revolutionising mobility, and smart governance to enable the legislative framework for social innovation in transport to flourish.”²

23. It is our belief that a cost-effective means of ensuring city-to-city connectivity is ensuring travel permits cover a broad geographical area, and a number of services. Clearly, if travel permits include trains, buses, and community transport operators people have a greater opportunity for a lower economic cost to travel between cities. As mentioned above investment in transport shows a generous economic reward to towns and cities and as such would be a cost-effective way to increase city-to-city connectivity.

24. The Chancellor has committed to building around 1,300 miles of additional road surfaces, as highlighted in our blog we believe that developing road infrastructure is important in increasing connections between cities³. It is a concern that the vast majority of transport infrastructure funding is being directed toward London, coupled with local authority cuts there is the possibility that northern cities will not see any improvement in city-to-city connectivity. In this light we believe that investment in better roads between northern cities is an obvious but important starting point. In addition to this we believe that there are benefits to providing financial encouragement for vehicles that carry multiple passengers to travel between cities.

² https://www.hitachi.eu/en/sib/whitepapers/downloads/whitepaper_002.pdf

³ <https://ctauk.wordpress.com/2015/11/30/autumn-statement-transport/>

25. Finally, it is important to consider digital infrastructure as integral to overall infrastructure investment. Personal devices are increasingly being used for planning journeys, buying tickets and providing users with flexible travel information. As these technologies advance it is necessary that digital infrastructure provides reliable, informative, and flexible travel information in order to optimise passenger travel experience.

What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?

26. We want to use the new impetus for greater integration arising from the Buses Bill to lead to the community having a greater say over what their local transport is like and, where they can, design their own transport solutions with accessibility and inclusivity built into them from the beginning.

27. We believe that governance arrangements should be responsive to the needs of vulnerable and isolated people and communities have not been always been at the forefront when public services and infrastructure have been designed. This includes older people, disabled people, those with long-term conditions, those living in social isolation, those who cannot access employment, education or training. As community transport operators have unrivalled insights into the broad range of needs and issues affecting these groups they would provide an ideal source of intelligence to inform the governance process and should be involved in it in some way.

28. In ensuring this can be achieved we believe that there should be a statutory duty on those charged with developing infrastructure in the north to ensure that community needs are considered from the design stage onwards.

London's Transport Infrastructure

29. Much of the discourse about transforming how transport is run in the north of England has been described as giving those areas "London-style powers". This is a reference to the perceived benefits for the public and passengers of the considerable powers Transport for London (TfL) to shape the transport system in the city region. Indeed, David McNeill, Director of Public Affairs and Stakeholder Engagement at TfL, spoke at length at our recent Westminster Conference about how London's experience with devolution and how its status as an integrated transport authority has enabled it to provide high quality and accessible transport for Londoners.
30. That said, we know that many people remain vulnerable and isolated with Greater London. Difficulties making the first or very last part of an entire journey might prevent them from ever benefitting from large-scale transport infrastructure improvements. Even if they can access the mainstream transport network over-crowding on some modes of transport makes it a daunting experience for some groups in the community.
31. We also know, however, that there is a vibrant community transport network across the capital filling gaps in mainstream services and meeting unmet needs and we know its work is understood and valued by TfL. Many of the social and economic benefits of ensuring community transport is part of the conversation about transport infrastructure, which we described in relation to the north of England, would also apply in Greater London. Indeed community transport operators in London have led the way in developing a robust methodology for demonstrating the social value of their services which will be published in January 2016.
32. The CTA would therefore wish to see these organisations with their unique insights into the lives and transport needs of vulnerable and isolated people fully included in the debate about economic and social challenges facing London to ensure that transport is as accessible and inclusive as it can be.

Sir Merrick Cockell
Chair of the Crossrail 2 Growth Commission
Crossrail 2
PO Box 72284
London
SW1P 9PB

17 December 2015

Dear Sir Merrick,

CBI London welcomes the opportunity to respond to the Crossrail 2 Growth Commission's consultation.

Across the UK, the CBI speaks on behalf of 190,000 businesses of all sizes and sectors which together employ nearly 7 million people, about one third of the private sector-employed workforce. In London, infrastructure investment is a key business issue and a recent CBI/ CBRE survey found London's transport infrastructure as the top priority for firms ahead of the mayoral 2016 election¹. In addition 94% of businesses see the quality of infrastructure as a decisive factor when planning future investment². Ensuring Crossrail 2 is developed so that it supports businesses as well as passengers creating homes, jobs and prosperity is therefore key.

The strategic role of Crossrail 2

Do you agree with the analysis of national/ regional economic trends which are integral to Crossrail 2's business case?

As some employees move further out of the city, reliable commuter routes to bring them into work are key

As some employees are forced to move further out of the capital due to rising housing costs, getting people from London's outer regions and from the wider country into London quickly and affordably is key. Increasing house prices are negatively impacting firms' ability to recruit and retain staff and the CBI/ CBRE London Business Survey found 32% of businesses saying that they are unable to offer flexible part-time employment due to the time/cost of the commute into London for employees who cannot afford to live locally. Similarly almost a third of firms said that employees are moving away from the local area and therefore having to leave their jobs as housing costs are too high. Transport connections are vital for commuters and Crossrail 2 will play an important role in facilitating these journeys.

Crossrail 2 needs to be viewed as a 'national' project

Highlighting the regional and national benefits of Crossrail 2 and ensuring the project supports the whole of the UK whether through transport links, jobs or supply chains is vital in getting public buy in to the project.

Crossrail 2 should be seen as a national project, supporting both the regions and the capital. Whilst the line will service greater London, it will also free up space on our national rail lines, indirectly supporting towns

¹ CBI/ CBRE London Business Survey 2015

² CBI/ AECOM Infrastructure Survey 2015

and cities such as Cambridge, Southampton and Woking. Crossrail 2 will also play a vital role in providing seamless connections from the new High Speed Rail line. 70% of high speed rail journeys will either start or end in London and so new infrastructure to support the influx of passengers will be vital.

The development of the line should benefit the regions through job creation and supply chains something that Crossrail was successful at doing.

Do you support a key objective of Crossrail 2, which is to ‘accommodate housing growth and regeneration across London and surrounding regions’?

Last year CBI London’s consultation response to the 2050 Infrastructure Plan argued that it was essential that our housing needs are incorporated into our wider infrastructure plans, with one of the key objectives of the plan being to unlock housing growth via infrastructure investment. Businesses cite ‘silo working’ as a key frustration and so we therefore welcome this objective of Crossrail 2 and would be keen to work with the commission to understand how we can accommodate housing growth and regeneration across London and surrounding regions. Almost 60% of businesses said that enhancing the housing offer including quality and affordability was a top priority for them ahead of the mayoral elections. Ensuring this Crossrail 2 helps to develop our housing offering is therefore key.

The local opportunities offered by Crossrail 2

To what extent is additional supporting infrastructure required to capitalise on the growth that Crossrail 2 could unlock?

As well as developing the new Crossrail 2 line, Transport for London must continue with investment across the wider tube network. Crossrail 2 will be just one line a commuter may use as part of a wider journey. We must ensure that journeys’ are seamless with a high quality user experience felt across the whole network. There will be little point having a good quality, fast Crossrail 2 if the onward tube connections are prone to signal failure, over-crowding and delays. Constant upgrades and developments must be factored in as a priority.

Resilient digital infrastructure and technology is key in supporting the opportunities that Crossrail 2 could provide

Investment in our digital infrastructure and ensuring our digital connectivity is resilient will be crucial ahead of the development of Crossrail 2. The successful running of these new trains will rely significantly on digital signalling. Ensuring we invest in good quality digital technology will therefore be fundamental to how well the new line operates.

Successful delivery and potential barriers

What potential do you think Crossrail 2 has to strengthen the employment market in your area of interest? Are any external factors needed to maximise Crossrail 2’s beneficial impacts?

Working with local leaders will ensure the project complements local growth strategies

The CBI has previously highlighted how national infrastructure projects must be integrated with local regeneration plans – this should apply to Crossrail 2 also. In order to get maximum bang for the buck that will be spent on Crossrail 2 we need to ensure that the project (local stations) are aligned with local priorities so that the full benefits are realised. It is vital that when choosing the location of stations, local council leaders are fully involved in the decision making process and can ensure that the plans will complement and enhance

growth strategies for the area. This will ensure that housing, jobs and growth will go hand in hand with the new station locations.

Crossrail 2 has the potential to boost local skills

Crossrail 2 has a key educational role to play in the local areas that it will impact. A concerted effort is required from businesses, government and other stakeholders to foster a long term culture of skills development to maintain progress towards Construction 2025, the industrial strategy for the sector. Many firms tell us their concerns regarding a lack of a talent pipeline in the sector. Crossrail 2 can help to encourage the future work-force by engaging them throughout its development.

Using digital connectivity to boost user experience

As route plans are made for the new line, Crossrail 2 must also outline how they plan to utilise 'smart' technology to boost user experience and passenger satisfaction. Smart technology has the ability to join up transport journeys with other transport suppliers and will enable real time information for passengers to make informed journey decisions. Not only would this help to improve journey experience, but it could also help reduce congestion across the network.

What are the most significant barriers to achieving any additional development opportunities that might come forward as a result of Crossrail 2?

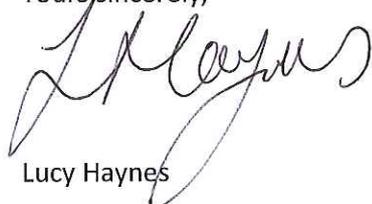

Joined up working is key to the development and success of this project. The Greater London Authority and Transport for London must engage early on with local stakeholders, businesses and local people to understand the additional development opportunities that might come forward as a result of the project.

A lack of investment in our digital connections will also negatively impact on the project. Ensuring we have quality and reliable digital signalling for the trains to operate effectively will be key.

CBI London would be delighted to discuss any of these points with the commission in greater detail.

Thank you for the opportunity to feed into the review,

Yours sincerely,

Lucy Haynes

CBI Director, London

Introduction

1. The County Councils Network (CCN) represents 37 English local councils that serve counties. CCN membership includes both upper tier and unitary councils who together serve over 25 million people across 86% of England. CCN develops policy, shares best practice and makes representations to government on behalf of this significant proportion of the country. CCN is a member-led organisation which works on all party basis and seeks to make representations which can be supported by all member councils. CCN welcomes the opportunity to respond to the consultation, and would also direct the National Infrastructure Commission (the Commission) to the responses submitted by our individual member authorities.
2. CCN councils account for 41% of England's GVA, a combined output of £527bn. Reflecting this county areas are also the nation's most significant contributors to the Treasury. County economies represent a very healthy mix of occupations – they have above average levels of skilled trades, managers and senior officials and private sector employment. Additionally the largest proportion of active enterprises in the country can be found in counties, the total number of which currently amounting to well over a million. To ensure that these opportunities are maximised we argue that the National Infrastructure Commission (the Commission) and government must work with county areas, alongside cities, to develop national infrastructure strategy and secure investment.
3. Within this submission CCN express our disappointment that the work of the Commission, leading into the 2016 Budget, will focus on London and big city regions. We set out a number of recommendations which would give a broader basis for the work of the Commission, to ensure that vital economic opportunities presented by county areas play a key role in national strategy.

The remit of the Commission – investing in counties and cities

4. Ensuring the right strategic infrastructure is in place will be key to the future economic health and competitiveness of the country. CCN therefore welcome the formation of the independent National Infrastructure Commission (the Commission) as a permanent statutory body. Government has an important role, working with local areas, to prioritise nationally important schemes, make capital available, encourage private and international investment and enable areas to raise investment in innovative ways.
5. The overarching role of the Commission is described as carrying out 'independent and unbiased assessments of the UK's long-term infrastructure needs ... to give clear strategic direction to industry and government and provide a firm basis for planning and investment.' The Chancellor has asked that the Commission undertake this role through five yearly National Infrastructure Assessments (NIA). In support of the first NIA the Chancellor has asked the Commission to propose some initial schemes for in-depth analysis in early 2016.
6. CCN welcome the introduction of NIAs, as they should ensure greater certainty for private investors, and provide greater assurance to local authorities and the development industry that

growth is deliverable in a sustainable manner, supported by existing and planned infrastructure. **We strongly suggest that the Commission thoroughly engage with the robust and evidence based priorities of counties in drawing up their NIA, and in making initial proposals for in-depth analysis in early 2016. CCN would be happy to facilitate and support such engagement.**

7. Additionally the Chancellor has written to Lord Adonis, Interim Chairman of the Commission, explaining that the Commission should concentrate its initial focus on three key areas; northern connectivity, London's transport infrastructure, and energy. As these are considered by central government to be the most pressing for the national economy, and these initial investigations will influence the 2016 budget. The Chancellor has issued the Commission detailed terms of reference for these first three projects.
8. CCN would like to express their disappointment that the work of the Commission has been so limited in the scope of its initial investigations, which will inform investment and priorities of the 2016 Budget. These initial inquiries focus entirely on London and the northern cities, without any regard to the rest of the country, except through references to 'commuter hinterland'.
9. We suggest that limiting the scope of these inquiries in such a way is not in the best interests of unbiased assessment of the UK's long-term infrastructure needs. We argue that strategic infrastructure investment is as pressing in county areas as it is city areas, that cities and counties function together, and that county regions represent substantial economic opportunities which must not be overlooked. These points are explained in further detail through this submission.
10. To address these points **we strongly recommend that the Commission takes a comprehensive, country-wide approach in making recommendations through its initial investigations, to inform the 2016 Budget. We urge the Commission to carefully consider the evidence put forward by CCN members to these initial inquiries, and broader evidence established through Strategic Economic Plans and other mediums to help inform this.**
11. **We also suggest that the Commission commit now to undertaking specific detailed inquiries into investment in county infrastructure as part of its next tranche of analysis and recommendations.**

Achieving our shared devolution goals

12. CCN share government's goals to devolve functions and financial freedoms, to bring decisions closer to the people and business they affect and to stimulate economic growth. To support this we must ensure that the Commission takes a localist approach and does not inadvertently centralise powers and decisions. Equally we must ensure that the work of the Commission and of government considers the economic opportunities in all areas and does not disenfranchise swathes of the country.
13. We note that government consider regional transport partnerships / Sub-National Transport Bodies to be an important stakeholder in the work of the Commission. We believe that in principle this is supportive of the devolution agenda. For example we are pleased to note that in its inquiry into infrastructure in the north the Commission will work closely with Transport for the North (TfN) to establish and evaluate options for investment.

14. We are also pleased that Sub-national Transport Bodies will involve joint decision making between the local elected representatives and businesses, the Department for Transport, Highways England and National Rail. These factors represent meaningful devolution and public service reform, which we hope will evolve over time.
15. To ensure that the best value is derived from these approaches **we strongly suggest that where counties wish to be a part of regional transport partnerships / Sub-national Transport Bodies they are encouraged to do so, and that government publically commits to promoting and listening to the important voice of counties alongside cities within these arrangements.**
16. In summer 2015 the Chancellor stated that TfN would be underpinned by 'devolving far reaching powers over transport to the North's Mayor-led city regions to deliver fully integrated public transport systems'. We must evolve this approach and ensure that the important economic and logistical hubs represented by counties are equally empowered, and able to contribute to regional growth. **We strongly suggest that transport and growth powers and budgets are devolved to counties where there are rigorous and appropriate governance measures in place and without a pre-requisite for metro mayors.**
17. In this context we are pleased that there has been a broadening of the membership of the TfN Partnership Board in recently months, beyond a city region focus to involve more county partners in the area. We would expect to see the role and voice of counties in such arrangements to growth over time, and would expect the Commission to fully consider the views of counties in its engagement with Sub-national Transport Bodies and individual areas.
18. **Where formal regional transport partnerships / Sub-national Transport Bodies are not in place, we still suggest that the Commission strive to engage groupings of local areas to help establish and appraise investment options put forward to government. CCN would be happy to facilitate such an approach.**

Counties role in sub-national transport and infrastructure governance

19. Counties are ready to take a lead role in driving sub-national transport and infrastructure, with local, national and international partners. Beyond the TfN example above counties have also been heavily involved with their city partners in the creation of Midlands Connect. This initiative has been promoted by Ministers and the Chancellor as a vital aspect of the 'Midlands Engine' for growth. We believe that Midlands Connect will play a key role in the infrastructure, transport and growth of the area, and would expect the Commission to engage with the board, in the same way they will engage with TfN.
20. Elsewhere in the country counties have come together to found England's Economic Heartland partnership. It is intended that this partnership will drive innovation in the area, as well as effective transport and infrastructure strategy. Forums such as this would be the logical point of contact for the Commission going forward, and help ensure that infrastructure opportunities from all parts of the country are considered.
21. In response to the national infrastructure, Sub-national Transport Body and devolution agendas more groupings of counties, counties and cities, or large county areas may begin to formalise sub-national transport arrangements. We must ensure that a one size fits all approach is avoided and that all areas have the chance to take on powers and influence national strategy.

The importance of county economies

22. To give a sense of scale, counties cover 86% of the landmass of England, they represent 47% of the country's population and are responsible for 70% of maintained roads. The combined population of counties now stands at 25.5m, and has grown 2.6% between 2010 and 2014, compared to 2.5% in metropolitan boroughs. It is estimated there are 10.6m households in CCN member councils, which is projected to rise 18% to 12.8m by 2037.
23. Using the latest data (2013) the economies of the areas served by the 37 CCN councils accounted for 41% of England's GVA, up 1% from the previous year, with a combined GVA of £527bn. This is strong performance compared to other areas of England. Further analysis of GVA growth since the recession shows that outside of London counties have seen the largest growth - 36% of GVA growth compared to 13% in the Core Cities. Equally county areas are the nation's most significant contributors to the Treasury. The latest breakdown of income tax receipts show that county populations contributed £66.4bn, which is 49% of all income tax in England and contributed 41% of all residential stamp duty.
24. County economies represent a very healthy mix of occupations – they have the highest levels of skilled trades in the country, above average levels of managers and senior officials and are only behind London for levels of technical jobs. Outside of London CCN members also have the highest levels of private sector jobs, and in counties the proportion of private to public sector jobs is steadily growing over time.
25. Additionally the largest proportion of active enterprises in the country can be found in counties, the total number of which currently amounting to well over a million. Outside of London counties hold by far the largest number of businesses created per 10,000 of population. There are countless FTSE 100 company headquarters based in county areas, to name a handful BAE Systems in Hampshire, National Grid in Warwickshire, Next in Leicestershire and Experian in Nottinghamshire.¹ Underlining this the Independent Commission for Non-metropolitan England stated 'Internationally mobile firms overwhelmingly choose non-metropolitan areas, not conurbations, as their base if they don't choose London'.
26. We argue that securing the national economy must take a broader view than simply connecting city regions together. Evidence is showing that county regions are growing faster than city regions and that the scale of business undertaken in counties is substantial. Equally evidence is showing that county areas are some of the most innovative² and that specialisation can be equally, if not more, successful outside of big city areas.³ We must ensure that infrastructure links cities and counties across sub-national areas and that business and commuting links for counties are built into infrastructure plans.
27. Rural areas, the majority of which can be found in counties, are set to become ever more important to the national economy according to DEFRA. A report of late 2014 found a net migration from urban to rural areas in England, stating 'whilst in many OECD countries there has been a trend towards greater urbanisation, the UK has been experiencing net migration from urban to rural areas'. This strengthening of the rural economy is associated with innovation, knowledge-based industries and a strong entrepreneurial make up. DEFRA conclude 'if harnessed, these trends could help drive significant growth in productivity, employment and output ... for the UK economy' and 'could offset aging demographics ... in such areas'.⁴

¹ The Independent Commission for Non-metropolitan England, Devolution to Non-metropolitan England : Seven steps to growth and prosperity, Final Report of the Non-metropolitan Commission, March 2015

² DEFRA, How increased connectivity is boosting economic prospects of rural areas, December 2014

³ Respublica, The Missing Multipliers: Devolution to Britain's Key Cities, September 2014

⁴ DEFRA, How increased connectivity is boosting economic prospects of rural areas, December 2014

28. Echoing these points the Independent Commission for Non-metropolitan England stated that 'non-metropolitan areas' high skills base positions them well for a world where trade is increasingly blurring the line between goods and services. They have an edge in knowledge intensive sectors, where getting people around the globe easily can be as important as moving goods ... Future transport investment decisions will be informed by local and global connectivity, including the role of regional airports in accessing global markets'.⁵
29. Many ports, freight routes, airports and logistical hubs sit within counties. These gateways to international markets must play a central role to infrastructure strategy and not just an afterthought as means of moving goods in and out of cities. Logistical hubs and routes present important economic opportunities in their vicinity, alongside their broader reach.
30. Alongside cities English counties have strong identities, commodities and brands which attract international attention. This is borne out by the number of FTSE 100 companies based in county areas, but has huge potential to continue to grow. Counties are iconic to British life and business; they represent the land and the mix of business and lifestyle opportunities which are attracting big business. They have the high value skills base and growing track record of innovation and specialisation to service start-up, growing and international business – we must ensure that physical and digital infrastructure keeps pace with this and helps the nation grow.

Capacity for improved productivity and growth

31. Despite counties' strong and vibrant economies delivering growth, employment and taxes for UK Plc, productivity remains a long-term weakness. Figures for counties show that their average productivity is 91, compared to the UK 100 Index. This is considerably below the London average of 122, and also the Core Cities average of 94.
32. A key factor in addressing this productivity gap is the right strategic infrastructure interventions. With this in mind central government and the Commission should work with county areas to secure investment in infrastructure priorities and devolve growth, infrastructure and transport powers. CCN have calculated that if counties were enabled to raise their productivity to the national average, this could contribute an additional £100bn to the UK economy.

The ability of local areas to invest in infrastructure

33. Alongside the devolution of transport, infrastructure and growth powers and budgets mentioned earlier in this submission CCN strongly suggest that national and sub-national growth will be maximised by equipping all areas with the fiscal tools they need to invest in infrastructure.
34. Greater London, and now Greater Manchester are able to raise a region wide CIL to fund strategic infrastructure projects. Equally the Chancellor has proposed that those areas with a metro mayor are able to increase Business Rates. CCN strongly argue that such powers must be extended beyond big cities, and must not be arbitrarily connected to the mayoral model of governance. **We strongly suggest that county areas are equipped with a full suite of fiscal freedoms, so that their businesses and residents are able to decide what measures are put in place to invest in strategic infrastructure projects.**

8/1/16

To Whom It May Concern,

Please find below my submission to the National Infrastructure Commission's call for evidence in relation to London's Transport Infrastructure.

Yours sincerely,

Rt Hon David Lammy MP
Member of Parliament for Tottenham

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London faces a wide range of economic and social challenges like any metropolitan city. But there are three specific areas where the challenges are so great that urgent action is required.

HOUSING: The housing crisis has been well documented, yet since 2010 no politician has implemented real solutions, either at national or mayoral level. Shortage of supply, driven by very low levels of house building, plus soaring demand, mean that the average property in my Tottenham constituency now costs more than £350,000, with prices up almost seven per cent in the past year. This not only means that far too many people will be denied the dream of home ownership; as prices and rents rise ever higher, it will also start to damage London's economy, as workers from all sectors and at all skill levels are priced out of the city's Labour market.

ECONOMIC DEVELOPMENT: We also need economic development and new jobs in relatively deprived areas such as Tottenham. The prosperity of the City still masks the acute problems for some people in my part of north London. Economic development here and elsewhere in London within commuting distance and north into the Stansted-Cambridge corridor is essential.

TRANSPORT: Clearly the pressures of population growth on the transport network are closely related to both housing and economic development. In Tottenham, pressure on the Victoria line and on rail services lengthens commutes for my constituents, causes delays and makes their journeys more crowded and stressful. Better transport systems would drive growth and jobs, as well as unlocking

significant new housing development and importantly would greatly improve the quality of life for many of my hard working constituents.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

I write this consultation in my role as Chair of the All Party Parliamentary Group on Crossrail 2. London needs full funding of its transport network – not the latest round of cuts imposed by the Chancellor. We need proper funding guarantees for Tube upgrades, including the Piccadilly Line, which some people in the western part of my constituency depend on. We also need network rail to upgrade the West Anglia Main Line to improve capacity, resilience and frequency across the area.

However, such transport projects alone will not be enough. Even though Crossrail will add around 10 per cent to the capacity of London's transport network when it opens from late 2018, we need a similarly transformative project to cope with the increase in demand a decade and more beyond that. Crossrail 2 is the obvious answer, and indeed the only scheme currently proposed which delivers a similar step-change in capacity. We need to get moving on making Crossrail 2 a reality.

Infrastructure should enable growth, and therefore projects should be assessed on their ability to payback the original investment. Static assumptions about how a place will function in future have been debunked by the Jubilee Line extension which transformed Canary Wharf. Our assessments should focus instead on a project's ability to create jobs, grow the economy and generate new tax receipts, allowing us to develop a more realistic view of the benefits of infrastructure investment. This would support investment not just in London but in other cities around the UK too.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The benefits of Crossrail 2 could be maximised by the project working closely with the boroughs and with local communities to make sure that it helps deliver the kinds of increased numbers of homes – and jobs – that it is capable of. We need to strike a balance between preserving communities and allowing development which makes their futures viable in a London of 10 million people.

In addition, it is vital that while Crossrail 2 will inevitably cause disruption to communities while it is being constructed: we must listen carefully to the communities affected about the impact the disruption will have and respond to those concerns where possible.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Delivery of Crossrail 2 and other large projects in London needs first of all to be as speedy as possible. We can't afford to delay the project any longer: we just need to get moving. The transport network is already under strain and even on the most optimistic projections, Crossrail 2 will not be in operation for another 15 years. Starting construction as soon as possible will mean lower prices, avoiding costly construction inflation.

That delivery can be ensured in the first instance by awarding the scheme substantial development funds in order to complete technical development and get planning consents through Parliament

before 2020. The majority of the wider funding package is already predicted to come from London, including contributions from the business rate supplement and Community Infrastructure Levy. I would like to see this augmented by fair devolution of business rates, as signalled by the Chancellor this autumn, and by radical new measures such as, for instance, the hypothecation of Stamp Duty in the capital, or a portion of it, for London to spend on such projects. Infrastructure projects such as Crossrail 2 have the potential to make a huge contribution both to the UK economy and to Treasury revenues, and funding of them should reflect that.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

I would like to see Transport for London take a more aggressive approach to using the profits of development to fund transport improvements, on the lines of that taken by Hong Kong metro operator MTR. Developers along Crossrail's route, for example, have already made a killing: we should be capturing much more of that to fund the transport projects transforming property values. But we also need to take a more long-term view of transport investments, as for example Paris does. There, the ambitious Nouveau Grand Paris project for extension of metro and suburban rail lines has funding for decades into the future, allowing much better planning – and value for money – of this kind of fundamental investment in the city's future.

National Infrastructure Commission call for evidence

Connecting Northern Cities and London's Transport Infrastructure

Submission from DB Schenker Rail (UK) Limited

January 2016

1. This is the response of DB Schenker Rail (UK) Limited (DB Schenker) to the call for evidence issued by the National Infrastructure Commission (NIC) in November 2015.
2. DB Schenker is the largest rail freight operator in the UK and is a wholly owned subsidiary of Deutsche Bahn, the second largest mobility and Logistics Company in the world. DB Schenker operates over 5000 trains per month in the UK conveying everything from cereals to coal, consumer products to biomass, petroleum to steel and is the leading rail provider to the construction industry in the UK. DB Schenker employs over 3300 people in the UK providing freight, infrastructure, rail support and charter passenger services within the UK and freight services to and from continental Europe via the Channel Tunnel.
3. DB Schenker, in common with other rail freight operators, is a wholly private sector activity receiving no material direct government support in the UK. In a heavily-capital intensive industry, DB Schenker owns and operates its own assets, including depots and rolling stock, and has invested heavily in new locomotives, wagons and facilities since UK privatisation.
4. DB Schenker's response is in four parts – general observations about the value and characteristics of rail freight, a description of the current demand forecasts for rail freight, observations on current government policy and rail freight's specific infrastructure needs and how these relate to two of the three national challenges set out by the NIC.

Rail Freight

5. Rail freight is a wholly private sector activity determined by customer and market needs. In this respect it is different to passenger rail and rail freight has a very different, less direct, relationship with Governments, funders and other devolved bodies as a result.
6. Rail freight generates over £1.5bn of economic benefits for UK plc every year through a combination of improved productivity, reduced congestion and wider environmental benefits. It is vital for the competitiveness of the UK economy and is an intrinsic part of everyday life in the UK.
7. Rail freight transports goods worth over £30bn pa, moving over 25% of the containers entering the UK and underpinning industrial sectors such as power

generation, construction and steel. Rail is a key supplier to UK manufacturing sectors such as the automotive industry and a major supplier to Network Rail and other Infrastructure Managers.

8. Rail freight has transformed itself since privatisation in the mid-1990s into a competitive and vibrant industry, recognised by the CEO of the Office of Rail & Road as “the most transformed sector in the rail industry since privatisation”. Total volumes increased by over 80% from 13.5bn ntkms in 1995 to 24.4bn ntkms in 2013-14.
9. The sector is changing as the UK economic base itself shifts, with reductions in traditional rail freight markets such as moving coal to power stations - where Government environment and other policy choices are driving conversion to biomass, renewables and other forms of electricity generation. Alongside this is an increase in the volume of containers moved for the growing retail/consumer sectors.

Continued rail freight growth will increasingly focus on the retail, construction and international sectors reflecting the general change in patterns of the UK economy.

10. This will have geographical as well as sectorial implications, as the concentration of the UK’s population south of a line from the Humber to Lancashire means that this will become increasingly significant for rail freight. Ensuring sufficient usable rail capacity is available south of this line to allow rail to compete with road will be more complex than ever over the next decade.
11. Rail freight is an intensely competitive industry – both within the mode and with road transport in particular. This strong competition has driven efficiencies, lowered prices to customers and reduced the costs of operation. The drive for longer and heavier freight trains is one example of how this has been achieved. In the decade after 2002/3 the number of freight trains on the network reduced by over 33%, whilst volumes increased by 17% - this meant (taking distance into account) that each freight train increased its cargo carried by over 50%.

These pressures will continue and the sectors offering the most volume potential for future rail growth are also those with the strongest price and service competition with road transport.

12. Intrinsic to maintaining rail freight growth and development will be continued private sector investment. Investment in rolling stock and facilities by freight operating companies such as DB Schenker is clearly understood - over £2bn has been invested by FOCs since privatisation.

In addition over £500m has been invested by Government (including EU funding) in Control Period 4 on freight specific network enhancements. In addition, a further £230m has been planned for Control Period 5 freight specific network enhancements by the UK Government and Transport Scotland.

Freight customers and suppliers - including ports and terminal operators have also invested heavily in rail freight facilities - over £250m in the last decade on port-related rail infrastructure alone. Investment in new rail-connected warehousing and terminals is critical for future rail freight growth.

Ensuring the private sector has the confidence to continue to invest to support rail freight - and rail freight growth in particular - should be a key consideration.

13. Rail can move freight in greater volumes, more safely and reliably than road transport. Each freight train removes up to 75 HGVs from the UK's roads – without rail freight over 7.5m additional road journeys would have been needed. Transporting freight by rail reduces CO2 emissions by 76% compared to road.
14. Rail freight operates in *response* to specific customer demand - a key distinction from passenger where services are planned in *anticipation* of demand. Many trains are customer-specific rather than multi-customer - so if a customer does not require a service on a particular day or week it will neither be scheduled nor operated. Rail freight's use of capacity is therefore often very different to that of passenger operators.
15. Both railway and political devolution pose challenges for national activities such as rail freight – for example in how an appropriate balance will be made between local/regional and national requirements/priorities in ways that best support both regional and national economic activity and growth.

Freight Market Study and demand forecasts

16. In October 2013 Network Rail published a Freight Market Study (FMS) as part of its Long Term Planning Process that (inter alia) contained growth forecasts for 2023 and 2043. These suggested that further rail freight growth of 2.9% until 2043 was possible. Government accepted that these forecasts were robust and should be adopted for planning purposes.
17. Crucially these were an *unconstrained* set of forecasts - i.e. current or anticipated future constraints were not taken into account.
18. In reality the railway is already constrained in many locations –e.g. the Midland Main Line which Network Rail has formally declared as “Congested Infrastructure” and for which there is increased current and forward demand for rail freight services. There are also well-known bottlenecks and capacity pinch points (such as the Felixstowe branch) that are inhibiting freight growth and development today.
19. The FMS forecasts were based on a series of key assumptions - two notable examples being the price of oil and its impact on road haulage costs/economics & the ability of the UK Planning system to enable necessary Strategic Rail Freight Interchanges (SRFIs).
20. The output of the FMS was consistent with previous studies in suggesting future growth will be concentrated in a relatively few key economic sectors - including Intermodal (the movement of goods in containers for both industry and the retail sector), Automotive, Construction (aggregates, other building materials and spoil/waste) and International (via the Channel Tunnel).

21. The FMS forecasts reflect the changing nature of the UK economy as it continues to develop and move away from traditional “heavy” industrial sectors such as coal and steel to a more service orientated composition which relates more closely to where people live and work.
22. Historic rail freight infrastructure provision reflected the role rail freight played between the 1960s and the 1990s; this has meant that the growth in intermodal traffic has driven the need for enhancement of rail infrastructure in other geographic areas, often in parallel with growth in passenger traffic.
23. The forecasts also highlight the critical and growing role of ports in the rail logistics chain; suitable and sufficient infrastructure connectivity to/from ports is critical for rail freight to be able to support the role the UK economy plays in global economic activity.
24. Appropriate connectivity between key UK ports and the main centres of UK population and economic activity is now a key imperative for future rail freight growth and the associated current (and additional) benefits for the UK economy.

This is where Government’s role - in terms of both policy support and funding - is key.

25. Alongside this, it will be necessary for continued investment in rolling stock and SFRIs (which will need to encompass both rail connected terminals + rail connected warehousing). The private sector will be willing to continue to invest in such facilities (both Freight Operating Companies such as DB Schenker and third parties) if both the investment climate and levels of political/regulatory risk are acceptable.

Government Policy and Rail Freight Infrastructure needs

26. The 2007 Rail White Paper defined the Strategic Railfreight Network (SFN) as “a core network of trunk freight routes, capable of handling more and longer freight trains, with a selective ability to handle wagons with higher axle loads and greater loading gauge, integrated with and complementing the UK’s existing mixed traffic network”.
27. The subsequent 2007 publication “Strategic Rail Freight Network - the Longer Term Vision” - was the then Labour Government’s expression of a long term rail freight policy. This policy was subsequently explicitly continued by the Coalition Government who (together with associated EU funding) invested over £0.5bn in rail freight infrastructure enhancements in Control Period 4.

The present Government is currently reviewing and reforming its rail freight policy.

28. Since 2007, UK rail infrastructure planning has adopted the central themes of the SFN;
 - a. Longer and heavier trains – with the standard length for intermodal trains becoming 775m;

- b. Efficient operating characteristics;
 - c. 24/7 capability;
 - d. W10/W12 gauge capability (including W9 gauge if Channel Tunnel traffic is involved);
 - e. New freight capacity where required;
 - f. 25kv AC electrification of freight routes (which provides opportunities for gauge enhancement as well as electric haulage).
 - g. The development of SFRIs, supported by the National Networks and Ports National Policy Statements;
 - h. Strategic Freight Capacity to protect necessary train paths.
29. These features remain relevant and usually form the starting point of rail freight infrastructure planning. This should continue to be the case, but the themes need regular review to avoid ossification.
30. European railways are already researching the feasibility of freight train lengths of 1500m on selected European mixed-traffic routes, and it is well known that North American practice remains to operate freight trains that are significantly longer than 775m.

Connecting Northern Cities

31. Northern cities are already important destinations/origin points for intermodal and other traffics to/from ports and the Channel Tunnel, with established services to & from key ports such as Southampton, Felixstowe and London Gateway (the three ports that currently dominate UK links to many global supply chains).
- Much of the Control Period 4 and 5 rail freight expenditure / plans have been targeted at improving gauge capability and limited capacity additions on routes to/from these ports. Some of the CP5 plans – for example gauge enhancement between Syston Junction (near Leicester) and Stoke-on-Trent - are currently being re-phased following the Hendy Review.
32. Planning freight trains into some existing terminals (e.g. at Trafford Park in Manchester) is already complex because of the sheer number of other trains at locations such as Manchester Piccadilly.
33. In addition, movements of bulk products such as aggregates and building materials also feature into cities such as Manchester and Leeds, although not to the extent currently seen in London and the South East.
34. The Humber ports – and especially Immingham – are the UK's largest rail freight forwarding locations with very substantial volumes especially of bulk products such as petroleum, coal, biomass and steel.

35. The port of Liverpool, with established rail traffics such as coal, steel and biomass, is investing in a new £300m deep-water container terminal that will double the port's container handling capability and a trial rail intermodal service to the West Midlands has recently been operated.

If the port's aspirations for growth are achieved, it is likely that there will be significant increases in rail freight volumes and these are likely to impact across the north of England and pose significant challenges for the rail sector.

36. Northern cities, particularly in the NW, are central to the FMS growth plans, whether from local ports or more distant ports or regions of the UK. Crucially capacity to accommodate this potential growth is limited/constrained on *all* the key routes.
37. Cross-Pennine transits have become especially challenging. It is not possible to obtain economically viable freight paths during the day on the main Manchester – Leeds route via Huddersfield (known colloquially as the “Diggle” route) and it is increasingly difficult to obtain freight paths on the Calder Valley route via Hebden Bridge.

The main “freight” cross-Pennine route has therefore become the more southerly Hope Valley line between Stockport and Sheffield. This is better located for (e.g.) aggregates movements from the Peak District rather than for intermodal or biomass movements. However access to, and capacity on, this route is not without its own challenges.

38. Studies into options for future cross-Pennine rail options therefore need to ensure that rail freight's needs are taken fully into consideration and that current routing assumptions should not be presumed to be ideal or even acceptable.
39. The West Coast Main Line (WCML) is the UK's principal freight artery, critical for intermodal and international movements and central to the realization of the FMS growth projections. Key elements in achieving this will include;
- a. Securing for rail freight an appropriate share of the capacity on the WCML that will be released after the construction of High Speed Two;
 - b. Ensuring that the introduction of classic-compatible HS2 trains onto the WCML north of the HS2 dedicated infrastructure does not result in a timetable that “squeezes” existing rail freight services or projected rail freight growth;
 - c. Ensuring sufficient connections for rail freight exist between the WCML and existing / proposed SFRIs in the North West.
40. Increased use of rail freight into and through Northern Cities would seem to offer potential additional benefits for customers/users if sufficient capacity could be developed. There would also be wider societal/environmental benefits in terms of a reduction in carbon and other emissions and improvements in air quality.

London's Transport Infrastructure

41. London's current rail freight activity falls into two distinct categories;
 - a. Trains that support the economic activity of London and the surrounding region.
 - b. Transit freight that passes through London because of its hub position in the UK rail network.
42. Very substantial volumes of construction materials are moved into London and the surrounding region and underpin much building and development activity. Trains come from Yorkshire, the Mendip Hills, the Peak District and Leicestershire as well as closer locations on a very frequent basis, conveying aggregates, cement and other building materials.

These are delivered to a network of relatively small single-user rail terminals where the product is unloaded, stored and then distributed by road to building sites. Physical space limitations at these receiving rail terminals mean that frequent rail deliveries are necessary and the operations often have characteristics similar to "just-in-time" deliveries. Many of these terminals also have operating limits imposed as part of planning consents which in turn impedes the relationship with the rail network.

43. In the opposite direction, rail can be an effective solution for the removal of spoil or waste from larger development sites, especially if the material is contaminated or requires special handling. For many years rail has moved containerized domestic waste from London for landfill.
44. Rail freight also provides substantial support for the Automotive industry in the London area, in moving automotive components and on occasion finished vehicles.
45. A notable exception to the commodities handled by rail in London is Intermodal or containerized goods. In part this reflects the proximity of London to the main Deep Sea ports, as well as the Channel Tunnel and short sea ports such as Tilbury and Purfleet. However the lack of any substantial SFRIs or terminals in the London area means that potential domestic intermodal traffics cannot be realized.

Strenuous attempts have been made over the past decade to develop new intermodal rail handling facilities in the London and South East. In particular, potential developments at Radlett and Colnbrook have spent years attempting to navigate the Planning System and being resisted by local authorities and residents at every stage.

46. A network of SFRIs, around London (perhaps in relation to the motorway or trunk road network) are a key requirement for the nation as well as the city/region to realise the economic and other benefits of modal shift to rail.
47. London's proximity to key ports such as London Gateway, Felixstowe, Tilbury and Purfleet also explains much of the transit freight that is routed via the capital. The broadly "hub and spoke" nature of the UK rail network means that there are few

routes between the arterial “main lines” outside of London.

Until relatively recently, some cross-London railways such as the West London Line & Gospel Oak – Barking Line were predominantly freight; however growth in demand for passenger rail services has led to dramatic increases in passenger use of these and other lines such as the North London Line, and increasing pressures between passenger and freight use. These routes are moving toward a very frequent ‘turn up and go’ passenger service which reduces capacity for rail freight services dramatically.

48. In addition, all rail freight services from the Channel Tunnel (whether traveling via High Speed One or Network Rail infrastructure) are routed via London.
49. Almost without exception, there are no alternatives to the current transit freight train routing through London. Development of the route north of Ipswich to Peterborough is aimed at accommodating *some* of the projected freight growth from Felixstowe – but none of the existing traffic.
50. Looking ahead, the volumes of rail freight in and around London will continue to increase.
 - a. The role of rail in moving construction materials will continue – DB Schenker, together with the construction industry, are developing new, larger & more efficient multi-user aggregates facilities at Bow, Cricklewood and Willesden. These will be capable of handling larger trains more quickly and will help to create the capacity required to support infrastructure growth in London. They will increase the product carried per train path into the capital and will provide modal shift potential. It is not clear if the development of these sites will create land capacity elsewhere for development or whether these will be in addition to existing facilities rather as replacements.

Without this movement of construction materials, planned developments and increases in housing supply are also likely to be impeded or frustrated.

- b. Rail will continue to support major infrastructure schemes – for example in the building of High Speed Two and associated developments such as the redevelopment of Euston Station or the Old Oak Common area.

This contribution can be maximized with early engagement within the Pre-Planning / Consultation process so that rail freight can deliver enhanced economic and environmental benefits to projects as proven by in the cases of Heathrow Terminal 5, London 2012 Olympics and Crossrail.

- c. DB Schenker is also investing in a new Railhub for automotive handling adjacent to the junction between Network Rail infrastructure and High Speed One at Barking. This facility will be able to exploit the movement of finished vehicles to and from the UK via High Speed One with its larger loading gauge which will increase the rail options available for use.

This facility will benefit Automotive manufacturers in the London area, but

also others across the UK and has the potential to become a vital node in imports and exports for a key UK manufacturing sector.

- d. When one or more SFRIs are finally opened, the potential for intermodal movements between London & the South East and the North West/Scotland will be significantly enhanced. Such movements are a key part of the forecast growth of the Network Rail FMS.
 - e. In addition, there is potential for rail involvement in “City Logistics” with rail movement of consolidated deliveries for retail outlets to terminal stations or other hubs, and then transshipment to (e.g.) electric or other vehicles for sustainable “last mile” delivery.
 - f. The continued development of London Gateway will also result in increased rail services, most (if not all) of which will be routed via London.
51. Increased rail freight services also offer the potential to reduce carbon and other emissions, improving air quality and supporting improved quality of life.
52. Together with the forecast increases in demand for passenger services, it is evident that much of London’s key rail infrastructure will remain mixed traffic in nature and operating at or near capacity, with potential implications for performance.

Increasing rail capacity in London via physical enhancement is expensive and disruptive; the deployment of ERTMS/ ETCS might offer some relief, but this is uncertain and some years away.

As a minimum, improved planning and co-ordination (within what is possible in competitive markets and customer requirements) would seem advisable.

53. On its own, it is unlikely that any rail freight developments will justify the level of capital expenditure in major infrastructure enhancement – but the benefits of rail freight may well make a substantial contribution to the benefits calculation of any wider business case and it is important that these are always carefully articulated and factored in.
54. Network Rail and other railway organizational forms typically follow the arterial route structure into London and hence cross-London movements such as rail freight will cross two, three or four railway organizational boundaries. It is important that any potentially negative effects of this are avoided as Network Rail devolves more power to its routes; this will be a key task for the System Operator function of the future.

The Benefits of Transport Investment: and why we can't build our way out of congestion

Submission to the National Infrastructure Commission by Dr David Metz, Honorary Professor, Centre for Transport Studies, University College London, formerly Chief Scientist, Department for Transport.

In this submission I offer evidence of the ways in which transport investment benefits individuals and society, in particular how this contributes to economic growth. I compare and contrast the rather different situations of London and the Northern cities.

Long term trends in travel behaviour

The Department for Transport (DfT) commissioned the first National Travel Survey fifty years ago and has repeated this regularly for forty years. Figure 1 shows the key parameters on a per capita basis covering all modes of travel (except international air). Average journey frequency has remained at about 1000 trips per person per year over the period. Average travel time has held steady at around 370 hours a year or an hour a day, a figure found globally for settled populations. What has changed is the average distance travelled, which increased from 4500 miles a year in the early 1970s to 7000 miles by the mid-1990s, since when there has been no further growth.

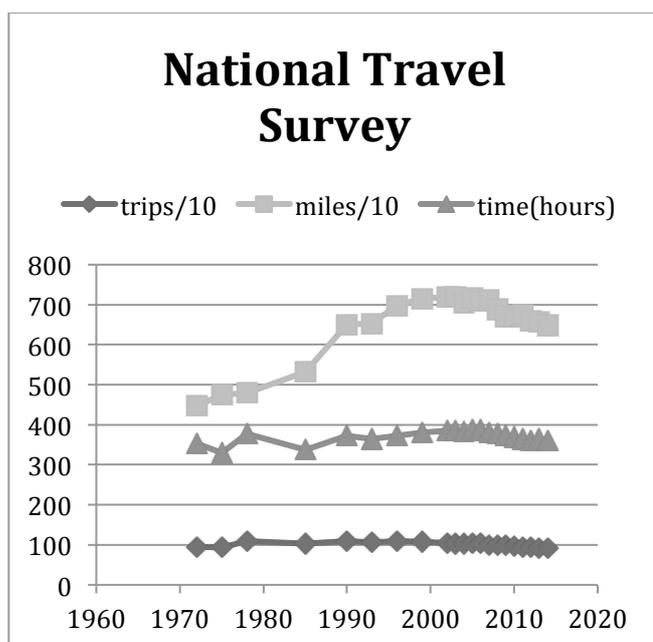

Figure 1 Source NTS(2015)

People have travelled further in the same amount of time because they have travelled faster, the consequence of investment in speedier forms of transport – private investment in cars, public investment in road and rail infrastructure and trains. It is important to recognise that people have taken advantage of higher speeds to reach more distant destinations, not to save time travelling to unchanged destinations. We travel further in order to have more access, opportunities and choices. For instance, by travelling faster on the journey to work, we have more choice of employment accessible from where we live in the time we allow ourselves for commuting, more choice of homes accessible from our workplace, and similarly more choice of shops, schools etc.

Figure 1 shows that there has been no growth in per capita travel for the past twenty years. Growing personal incomes are no longer an important factor in the growth of travel. Rather, population growth is now the main driver of overall demand growth.

Three-quarters of the average distance travelled in Britain is by car, hence we find that the average distance travelled by car has also ceased to grow, starting well before the recent recession. This cessation of growth of per capita car use is found for most of the developed economies for which data is available, a phenomenon known as ‘peak car’. A number of contributing factors have been identified, including less interest in cars by the urban young, changes in company car taxation (in the UK), saturation of demand for access to daily travel destinations, and technological constraints on faster travel (Metz, 2013).

Economic benefits of transport investment

The convention of transport economists, central to the DfT’s investment appraisal methodology, is that the main economic benefit of transport investment can be estimated as time saved through faster travel. Such time savings are valued because they permit more productive work or desired leisure. However, the evidence of the National Travel Survey is that there are no time savings in the long run, as seen in Figure 1, which is in effect an evaluation of the impact of cumulative investment over a forty year period. Time savings are therefore short run and mislead as regards the benefits of investment in long lived infrastructure.

People take advantage of higher speeds to travel farther, which results in changes in land use, development in particular. This is evident in the regeneration of East London, Docklands and beyond, the consequence of public investment in urban rail that has made brownfield land accessible for development by private sector developers who construct commercial and residential properties that accommodate jobs and homes for the city’s growing economy and population. The causal mechanism linking transport investment to economic benefit is via improved access and resulting development.

Notional time savings by those who, for instance, will travel from home to Canary Wharf using Crossrail when opened do not illuminate the case for this investment since these depend on both uncertain forecasts of passenger

numbers and problematic Stated Preference experiments intended to value individuals' trade-offs between time and money. Moreover, the 'wider impact' benefits that are conventionally added to the time savings are based on econometric estimation of agglomeration and related effects – further notional benefits, not directly observable.

Changes in land use and enhancement of land values are not included as benefits in conventional appraisal because this is seen as double counting benefits already included as time savings. However, this is a theory-based approach. An evidence-based approach would count what is real and observable, which would avoid double counting because people can do only one thing at a time – if they are taking the benefit of faster travel to gain more access, opportunities and choices, they cannot be saving time to carry out other activities, and vice-versa.

Investment appraisal of proposed transport investments should accordingly be based on evidence of expected benefits, as assessed from evaluations of outcomes of similar completed schemes. In general, changed land use and real estate development will constitute an important part of the benefits, which it would be misleading to disregard.

Road and rail investment

The case of investment to catalyse the development of Docklands is characteristic of new rail routes. Recall the USA in 1840, populated largely along the coasts and inland waterways, the economy about the size of that of Italy's. There followed a boom in railway construction that opened up the interior to agriculture, mining and industry such that by 1890 this was the largest economy on the world.

Rail investment can effect a step change in access. For roads, the effect is generally incremental. Consider England's Strategic Road Network (SRN) where much investment is planned to cope with forecast growth of traffic. Congestion largely occurs near to populated areas where local users take advantage of the network for daily travel, whereas remote from such areas the traffic generally flows freely. Thus about half the traffic on the M25 comprises long distance users, for instance between the south coast ports and the Midlands and the North, avoiding London, the purpose for which this orbital route was built. The other half is local traffic, in particular journeys to and from work giving rise to the familiar morning and evening peak congestion.

The conventional approach to investment appraisal sees a congested motorway as an opportunity for investment to increase capacity. Time savings per vehicle multiplied by the large number of vehicles, then multiplied by standard values of time savings, generate monetary values of economic benefits that are compared with the construction costs to allow judgment about value for money. However, the time savings per vehicle are quite small.

Evaluation by the Highways Agency of a large number of what it terms 'major schemes' indicates average time savings of 3 minutes at peak, less away from the

peak usage. There is debate about the significance of such small times savings. On the one hand, it is argued that these are too small to change behaviour and so should be disregarded. On the other, it is contended that small time savings add up and so in logic must be counted.

While 3 minutes saving on a long distance trip is immaterial in behavioural terms, such time saving is likely to be significant for a local user. The faster travel made possible by an extra lane or improved junction, for instance, allows more opportunities and choices, particularly when people come to change jobs or move house. More generally, in those parts of the country where demand for housing exceeds supply, it must be expected that local users will take advantage of additional capacity on the SRN to seek more distant housing opportunities that they can afford. A similar effect is seen with urban rail improvements such as London's Overground. Some of the largest percentage increases in house prices in London in recent years have been found near stations on this route south of Docklands, in locations like New Cross, of limited inherent attraction but with relatively low priced housing.

When analysing the case for road investment, it is important to consider the different kinds of user and how each may benefit (as is done for rail investment, where commuters are distinguished from long distance travellers). Available evidence is consistent with the proposition that the main benefits of investment in the SRN accrue to local users who are enabled to travel further on their daily trips. The extra traffic thereby generated is known as 'induced traffic', which is the consequence of road construction and arises because in the long run people take the benefit of faster travel by travelling further, not by saving time. This extra traffic restores congestion to what it was before the investment and is the basis for the maxim 'You can't build your way out of congestion', which we know from experience to be generally true.

The increased access made available to local users leads to changes in land use - property development where planning consent is granted, increased prices of existing property where not. Such development is largely unintended. There is, however, a case for intentional road construction to foster development, but this has to be led by the developers and planners. If they agree that a site is suitable and commercially attractive for development, whether residential or commercial, and if investment in road access is needed to permit the development, that could be an appropriate claim on a roads budget, whether local or national, subject to a value for money test.

An example is the plan for a new 'garden city' on a former military site near Bicester, where 13,000 new homes are to be built and where the DfT has allocated £44m for road construction, including a link to the M40. This illustrates both that new housing on greenfield sites will require road investment on account of car ownership by residents, and that decisions about the location of such investment must be based on the intentions of the planners and developers, bottom up, not as part of a top down national strategy.

Tackling congestion

The rationale for much roads investment is to relieve congestion. One stated aim of the Government's Road Investment Strategy is a 'free-flow core network, with mile a minute speeds increasingly typical'. But if we can't build our way out of congestion through investment in civil engineering technologies, how is this aim to be achieved?

One possibility would be to toll new road capacity, partly to finance the construction and partly to deter local users who impede long distance traffic. The M6 Toll road operates successfully in this way.

A second approach addresses the reason why congestion is a problem. Surveys of road users indicate that an important factor is lack of reliability - the uncertainty of journey time. This can be tackled by providing users with good predictive trip time information. An example is the motorway roadside variable message sign predicting the time to the next junction – albeit short range and hence of limited utility. A more ambitious service is provided for freeway users in the Seattle area of the US who can input to the Department of Transportation website the locations of their home and work, the time they wish to arrive at work, and are advised the time to leave home to be at work on time 19 times out of 20. A further example is Google Now, which includes predictive travel times on the road system.

As well as providing useful information to individuals that lessen unreliability associated with congestion, there are benefits to the network as a whole. There are two kinds of road user: those who need to be at their destination at a particular time (for instance, going to work, to a meeting, making time-critical deliveries), who can use predictive journey time information to decide when to set out; and those who are more flexible in trip timing (going shopping, making am/pm deliveries), who can use such information to avoid peak traffic. This is win-win since the more the flexible users can avoid peak times, the less the congestion experienced by those who cannot avoid them.

The scope for mitigating the uncertainty associated with congestion is indicated by the ability of efficient road freight hauliers to offer clients just-in-time delivery. A haulier may contract with a supermarket chain to deliver from the central warehouse to the stores within 30-minute time slots, which the haulier can achieve because of the good understanding of the network and the ability to manage the location and performance each vehicle in the fleet using real-time and predictive traffic data from commercial sources.

Transport and economic performance

This road freight example is one instance of the way in which investment, in digital technology in this case, can contribute to improving business performance. It should be seen in the broader context of retail distribution taking advantage of faster travel on the road network to optimise efficiency by

consolidating many regional depots into a few large central facilities, thereby saving estate and inventory costs while improving distribution to high street outlets, so enhancing competitiveness.

It is, however, difficult to generalise about how transport investment may be expected to improve economic performance where the road and rail networks are mature, so that investment is at the margin, rather than transformative. The What Works Centre for Local Economic Growth at the London School of Economics has reviewed 29 impact evaluations that met minimum standards of evidence (WWC, 2015). Key findings, mostly based on a small number of studies, include:

- Road projects can positively impact local employment. But effects are not always positive and a majority of evaluations show no (or mixed) effects on employment
- Road projects may increase firm entry (either through new firms starting up, or existing firms relocating). However, this does not necessarily increase the overall number of businesses (since new arrivals may displace existing firms).
- Both road and rail projects tend to have a positive effect on property prices, although effects depend on distance to the project (and the effects can also vary over time)

The general lessons from this review of transport investments are:

- The economic benefits of transport infrastructure spending – particularly as a mechanism for generating local economic growth – are not as clear-cut as they might seem on face value.
- Arguments for spending more in areas that are less economically successful hinge on the hope that new transport is a cost-effective way to stimulate new economic activity. We do not yet have clear and definitive evidence to support that claim.
- Our findings raise fundamental questions about scheme appraisal and prioritisation, and about the role of impact evaluation in improving decision-making around transport investment.

Transport investment in London

The population of London is growing quite rapidly, but the city long ago decided not to accommodate additional car use, so the share of journeys by car has fallen from a peak of 50% of all trips in 1990 to 37% currently, with further decline to about 27% expected by 2050 on the basis of forecast population growth (central case) and continuing policies to invest in rail but not increase road capacity. Figure 2 shows an estimate of the share of journeys by car in London over the century 1950-2050. This exemplifies the concept 'Peak Car in the Big City'.

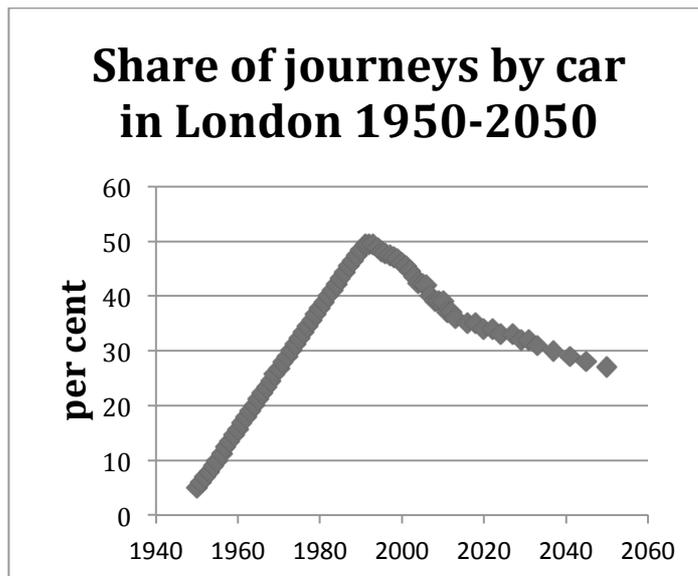

Figure 2 Source Metz (2015)

London is thriving - economically, culturally and socially – both despite and because of the decline in car use. Two key policies are largely responsible: a road capacity constraint plus parking controls in the inner boroughs and congestion charging in the centre; and major investment in rail that provides speedy and reliable travel for work trips, compared with the car on congested roads. As we see at Canary Wharf, well paid professionals can be attracted out of their cars onto trains through the stick of limited parking and the carrot of frequent fast rail services. In contrast, cities that rely on buses for public transport find it much more difficult to get commuters out of their cars.

The Mayor of London is responsible for both the transport system and for spatial planning, a helpful combination which contributes to the success of the city. The London Infrastructure Plan 2050 outlined options for investment in transport and other infrastructure to respond to population growth from 8.6m currently to 11.3m central estimate by mid-century and the corresponding growth in employment. This spatial plan provides a suitable strategic context for specific schemes such as Crossrail 2.

The economic case for each individual scheme will need to be made. This case needs to be grounded on evidence-based expectations of the benefits, in particular development of real estate (land and property) that will accommodate jobs and homes. Benefits from travel time savings should be counted only when these can be observed. Notional benefits from ‘wider impacts’ would be subsumed within market values of property and rents.

Given that the long term benefits from transport investment are found as real estate development, Transport for London should work closely with developers and planners to secure the benefits from its investment. In favourable cases, the enhancement of land values may be sufficient allow the developers to contribute to the cost of the transport investment.

Transport investment in Northern cities

The example of London argues for a spatial plan to provide the context and rationale for transport investment in the Northern cities to accommodate population and economic growth. One possible outcome, perhaps tacitly, would recognise Manchester as the main centre of the region, with an emphasis on the development of that city as a centre for business services. Another, perhaps politically more feasible, would be a multi-centric region of medium sized cities, somewhat analogous to the Thames Valley, with a mix of manufacturing and services. One key question is how to take advantage of the research potential of the universities, both for the cities in which they are located, and across the region. Related to this is the question of where to locate business in relation to the availability of skilled staff (it is noteworthy that Amazon has recently moved its UK HQ from Slough to central London).

At present there is no mechanism for spatial planning across the Northern cities as a group, and hence no consideration of options for location of population and economic growth across the region. Absent a spatial plan, decisions on transport investments will be an important influence on spatial development in ways that need to be addressed as part of the investment case.

It is not straightforward to develop a persuasive case for specific investments in the context of the Northern cities. Estimates of benefits based on travel time savings give no indication of the spatial location or likely scale of development. Estimates of 'wider impacts' depend on either rules of thumb or ambitious modelling which cannot be validated. It is therefore hard to say how transport investments will benefit the economies of these cities, based on conventional appraisal methods.

It is easier to predict changes in land use arising from transport investments that change travel to work patterns. Faster travel may be expected to result in people seeking housing and employment opportunities further afield. This would both improve the efficiency of labour markets and create opportunities for housing developments. For rail investments in particular, the location of new housing should be planned as part of the investment case.

Urban rail investments can allow cities to grow to higher density while meeting the mobility needs of the population. Regional rail plays a similar role. The tram-train being piloted at Sheffield-Rotherham is a relevant innovation. Bus rapid transit likewise provides speedy, reliable travel but at a cost lower than light rail (trams). Higher urban population densities generate agglomeration benefits, not only economic but also cultural and social, which enhance the attractiveness of cities, provided other aspects of urban liveability receive adequate attention. Accordingly, both urban and regional rail investments justify positive consideration.

What is unclear, however, is the extent to which better regional rail links that improve connectivity *between* cities would generate economic benefits over and above those associated with housing and labour markets for individual cities.

Road investments are even more problematic. For instance, the scheme to enlarge the M62 to four lanes along its entire length is intended to support the Northern economy but would induce local commuter use that would limit the benefits to long distance users. A new road link, largely in a tunnel, between Manchester and Sheffield might be of less benefit to commuters but would be expensive and hard to justify for improved connections between two cities that are otherwise well connected. More generally, road investments intended to improve connectivity within the region, whether north-south or east-west, are likely to be nullified by the stimulation of local use. Altogether, the ambitious plans for road construction set out in the Northern Transport Strategy seem of very uncertain benefit, albeit more consistent with a multi-centric region in which manufacturing remains important.

On the other hand, the plans for integrated information and ticketing across all public transport modes, part of this Strategy, are clearly sensible and, as digital applications, may be expected to be far more cost-effective than investment in civil engineering technologies. More generally, opportunities should be sought for other digital technology investments to improve the operations of the transport system and to enhance the experience of users. Predictive journey time information on the road network is one important possibility.

Modelling and forecasting

The standard approach to justifying transport investment of any scale involves modelling that compares a 'do something' case (ie with the investment) with a 'do minimum' case (without the investment). Most models estimate travel behaviour changes in the absence of land use change, generating travel time savings resulting from the investment that are used as inputs to the economic appraisal. However, for reasons previously discussed, assuming no changed land use is not consistent with evidence from completed schemes. Models that integrate transport and land use are available, although not generally employed.

Modelling involves much uncertainty, many simplifying assumptions and limited data for calibration. Transport models cannot be independently validated. Given the considerable judgement involved in generating plausible outputs, it is not surprising that modelling is generally found to support the inclinations of the authorities that commission the studies. When such authorities are bidding for central government funds, other people's money, modelling will generally be found to support the bid.

A further difficulty with transport models is the routine assumption that the future will be like the past, with change driven only by exogenous parameters such as GDP growth, population growth, oil prices etc. But if the future is different from the past, as is indicated by the peak of car use in London (shown in Figure 2) and similar indications for Birmingham and Manchester (Metz, 2013), then forward looking relationships (elasticities) need to replace historic calibration data. This is difficult to achieve in practice. For example, the DfT's

National Transport Model has not yet recognised the emergence of peak car use in London and so forecasts substantial increases in car traffic in this city.

Conclusions

The transport system moves people and goods through space. New investment adds to this movement, the benefits being reflected substantially in changed spatial distribution, not reductions in travel time. The difficulties that the Commission is likely to experience in making recommendations for transport investment derive in part from shortcomings in existing methodologies, in particular that conventional economic appraisal is based on estimates of notional times savings and disregards the evidence for changed land use and real estate development as important benefits of investment. Moreover, conventional travel demand modelling and forecasting does not recognise important recent changes in behaviour, as reflected in the peak car phenomenon.

For its medium term work, the Commission might wish to review these methodological issues. More generally, there may be a role for the Commission to act in ways analogous to the Office for Budget Responsibility and the Committee on Climate Change, offering advice to national and local government on the merits of infrastructure investment based on independent analysis, both of methodologies and of substance.

In London, expected economic and population growth is the main determinant of future transport investment, which is therefore relatively unproblematic in principle. For the Northern cities, such growth is less obviously a given, and a desired role for transport investment is to foster growth. However, the prospects for speculative transport investments are uncertain. Hence to secure the benefits of transport investments, decisions should not be taken in isolation but as part of planned real estate developments involving both developers and planning authorities. Decisions on urban and regional rail investments seem more straightforward than for road investments, for which there is a good case for preferring cost-effective digital to costly civil engineering technologies.

RE: NATIONAL INFRASTRUCTURE COMMISSION CALL FOR EVIDENCE

I am writing on behalf of the Ebbsfleet Development Corporation (EDC) in response to the call for evidence on National Infrastructure needs.

Ebbsfleet Development Corporation

The EDC has been established by Central Government to deliver Ebbsfleet Garden City: a development of up to 15,000 new homes in North Kent, with new employment opportunities and supported by transport, utility and community infrastructure. Blue and Green infrastructure will also be an important and defining characteristic. The recent announcement of Enterprise Zone status and securing £310 million of funding to support infrastructure will result in a high level of activity in developing the garden city and since is now over 1.2 million square metres of commercial, retail and leisure uses consented across the Garden City resulting in both residential and commercial growth.

Ebbsfleet Garden City is to be delivered at pace aspiring to provide a high quality built environment. It is anticipated that the impact of the Garden City will be felt beyond the EDC's boundary, with a positive ripple effect locally (particularly in Dartford and Gravesham boroughs), both in the residential and commercial markets. Whilst it is not possible to quantify this as this time, anecdotally a positive uptake in the housing development and developer interest is being reported locally following the Garden City announcement.

Existing Strategic Context and Connectivity

From a transport perspective, Ebbsfleet Garden City is very well located; existing rail connections provide both high speed (HS1) and conventional rail services into London from three local stations: Ebbsfleet International, Northfleet and Swanscombe. Central London is therefore within 17 minutes of Ebbsfleet Garden City, with excellent connectivity into the wider Kent region too. The presence of direct Eurostar services additionally means quick and easy access to continental Europe.

Rail infrastructure is therefore one of the key attributes and requirements of Ebbsfleet Garden City as future destination for living, working and leisure. In response to the questions asked by the NIC the following key infrastructure improvements are hugely relevant:

Upgrading the A2

Upgrading the A2 is identified as one of the top 40 infrastructure items in the NIC under the strategic road network capacity heading. The delivery of the Garden City is heavily dependent on there being sufficient capacity in the local and trunk road network. Whilst the primary infrastructure of HS1 will take some of the strain for the commuting population, the homes under development at Castle Hill, the National Grid site, at Northfleet and at Ebbsfleet and the rest of Eastern Quarry, along with the advent of the London Paramount resort in 2021, will mean that an improved A2 needs to be functioning at optimum levels. The two crucial junctions are Bean junction and Ebbsfleet junction which unusually for a dual carriageway are within 1 mile of one another on the A2 to the south of the Garden City and the sites referred to above.

Ebbsfleet International Station

Following initial studies by HS1, there will be a need to upgrade the station building at Ebbsfleet International should the major international resort London Paramount come to fruition, to ensure that it has sufficient capacity to cope with future customer projections. This will include changes to facilitate pedestrian flow, way finding and both core and non-core facilities to ensure an excellent service and environment for all types of customers, noting particular that the London Paramount resort proposals will mean a more two way flow, as opposed to the current, near tidal operation.

Rolling Stock

Following initial studies, it is apparent that new rolling stock and train services will be required to cope with the large increase in future customer demand, particularly at peak commute times and during new weekend peaks created by the London Paramount Resort. The quality of service delivered along the track and at stations, both during and after construction, must be protected to prevent disruption to train operations and the travelling public.

Lead in times for procurement of rolling stock are lengthy and need to be planned accordingly to avoid the negative public perception of the railway and corresponding detrimental impact on the new developments and the Garden City.

Crossrail

A safeguarded Crossrail route already extends beyond Ebbsfleet from Abbey Wood to Hoo Junction. When seeking to deliver a garden city in the 21st Century this route is seen as an obvious opportunity that the EDC should pursue. The EDC feel that extending Crossrail from its current terminus at Abbey Wood to the stations at Swanscombe or Northfleet or Gravesend along the existing protected route would be extremely beneficial to growth in the vicinity. An extension into Ebbsfleet International Station would connect much of the rest of Kent into this service, particularly to Heathrow.

This infrastructure is imperative to attract development and investment in the Ebbsfleet area and as such the EDC has joined with Bexley Council, Kent and TfL in preparing a joint submission sent under separate cover. Provision of this Crossrail extension provides a further direct route from London, improving the Ebbsfleet location for commuters and hereby increasing housebuilder confidence in the location. It further increases commercial and employment potential in the area and continues to assist in opening up North Kent/ East London as future centres for development. North Kent’s development plans and population growth form an attractive proposition for new companies from the UK and overseas to relocate or expand here. For this to happen road and rail infrastructure must be improved and capacity increased.

Yours sincerely,
Louise Wyman
Director of Strategy

8th January 2016

Dear Sir,

National Infrastructure Commission: call for evidence
Response of England's Economic Heartland Strategic Alliance

The Strategic Alliance is a non-statutory partnership whose participants share a collective ambition to realise the potential of England's Economic Heartland. Its participants are committed to looking beyond current success and, through collaborative working to a common purpose, raise levels of productivity to match, and where possible exceed, those of global competitors by addressing the identified barriers to economic growth.

As an Alliance of strategic authorities and their constituent LEPs, the partnership represents almost 3.5 million people from:

- Oxfordshire
- Buckinghamshire
- Northamptonshire
- Milton Keynes
- Luton
- Central Bedfordshire
- Bedford
- Cambridgeshire

It is an expressed aim of the Alliance to seek to become a statutory Sub-National Transport Body. The Alliance partners are also committed to developing a strategic infrastructure plan whose scope reflects that of the Commission: a recognition by the partners of the critical importance that strategic infrastructure has to play in supporting planned growth.

Given these ambitions, the proximity of the Heartland to London, the Midlands and North and our shared issues with connectivity, London transport infrastructure and energy supply, the Alliance looks forward to working closely with the Commission as it looks to advise Government on future infrastructure investment priorities.

Connecting Northern Cities

1. ***To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?***

2. ***What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.***
3. ***Which city-to-city corridor(s) should be the priority for early phases of investment?***
4. ***What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?***
5. ***What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?***

The Alliance makes no response to these questions but raises the matter that the success of economic initiatives in the North are in no small part dependent upon the infrastructure connections through and across the Alliance area, particularly through improved radial and orbital movements from London and the South Coast by road and rail.

London's transport infrastructure

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London and its commuter hinterland face significant economic and social challenges in the short, medium and longer term. Unless drastic changes are made over the next two to three decades, congestion will have a severe impact on the economy and people's daily lives, with many journeys being effectively impossible. Forecasts show that additional transport capacity is required across the wider South East but this should not necessarily be through continued emphasis on focusing exclusively on radial connectivity. New or improved strategic road and rail infrastructure across the wider South East will change travel patterns thereby supporting economic development in the wider South East and at the same time provide some relief to the demand on traditional radial corridors serving London. In addition to giving rise to wider beneficial impacts for London and England's Economic Heartland, such an approach would be consistent with the Government's ambition to rebalance the economy.

It is clear from our engagement in the emerging London Plan, that the economy will continue to be over-heated in the city and there will be difficulties in meeting the housing demand that comes with this. It has also been accepted that the South-East supports London growth by delivering homes to meet the current and planned growth through our own housing allocations. A sub-national approach to strategic planning will be needed to avoid offsetting this economic growth by extending radial links outward to bring labour to jobs; rather there needs to be a shared aim to re-balance the economy across the South East (and indeed to the north as well) and seek to reduce the need for journeys through/to London by providing much needed infrastructure to support economic growth in the wider South East. This will allow London to meet more of its own need whilst supporting a more balanced economic approach.

Some of the fastest-growing towns and cities in England are located in a belt to the north of London which already enjoy some strong, albeit well-used, links which support London. England's Economic

Heartland – with an economy worth £90bn but with the potential to grow another 20 per cent - clearly has the potential to help offset some of the over-heated economic impacts on London so that existing radial networks can more efficiently serve in and out-commuting to meet demand. The economic potential of the Heartland area reflects its competitiveness in global markets, driven by its leadership in the digital economy. Our approach to investment in transport infrastructure must avoid reinforcing traditional patterns of movement when economic growth derives from the new economy.

England's Economic Heartland sits on the busy road and rail transport corridor between the south coast ports, the Midlands and the north and enjoys easy links to London and the West Midlands via the M40. However, it suffers a lack of east-west connectivity, in particular to the high-value growth areas around Milton Keynes and Cambridge, and also in terms of access to/from the international gateway at Luton Airport (including business aviation needs arising from businesses in the Heartland area operating in the global market).

There are currently no direct rail connections between the centres of Oxford and Cambridge and to the areas in between (forcing commuters to travel into London in order to come out again), while travel by road involves cross-country single-carriageway routes or use of the M25 around London. Improving the connectivity on this corridor – through East-West Rail and the Oxford to Cambridge Expressway projects - will place the authorities in the Alliance at the centre of the south-east orbital corridor as a key hub for south-west to north-east transport. As a result, England's Economic Heartland would realise further improvement in agglomeration opportunities for jobs, growth and innovation, with its vastly-improved road and rail links to these high-value centres of the UK economy.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

The focus for investment to help London should not solely be within London. Existing radial routes, much the focus of current and previous national investment, serve to provide vital lifelines for labour supply to meet London's booming economy. While the Heartland area has good radial connections into and out of London, the service level on transport connections across much of the area - for example, including between major economic hubs such as Oxford, Cambridge, Aylesbury, Milton Keynes and Luton – is notably poor, a consequence of existing high levels of economic activity and travel demand already looking to avoid the need to transit the London area.

The lack of transport for people and freight between these areas creates an artificial barrier between hubs of knowledge-based growth. This area was recently recognised as being the most innovative part of the UK - connectivity between this area, and particularly north London, will not only reinforce London's and the UK's attractiveness in terms of investment, but as the area also links very well to the North West and North East, it provides a good platform for linked innovation growth in the Midlands and Northern Powerhouses.

Pushing forward with plans to complete East-West Rail and the Oxford to Cambridge Expressway (including vital links to the A34 linkage to the South Coast ports) provides a critical and long overdue outer-orbital that complements growth in London by reducing the need for traffic to transit through

it, supports the Alliance partners to realise the potential of England's Economic Heartland, as well as enabling the logistical needs of the national economy to be supported.

- ***How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?***

East-West Rail will reconnect Oxford to Milton Keynes and Cambridge by rail, and direct rail access from the west into Heathrow. This is due for completion in Control Period 6, post 2019 and must not slip any further in delivery.

In addition, work on the Oxford to Cambridge expressway is underway and we are working with Highways England to develop a route based strategy linking Southampton and the East Midlands, which will include improvements to the A34 and the development of an expressway to connect the two growth centres, linking up major economic hubs along the way (i.e. Milton Keynes, Aylesbury, Luton). England's Economic Heartland will put forward an initial statement of investment priorities in autumn 2016 as part of the input into the review of the Road Investment Strategy (due to be reviewed in 2017) and the related review of the rail infrastructure review.

- ***What might their potential impact be on employment, productivity and housing supply in London and the southeast?***

Work to date has demonstrated that improvements in economic productivity across the Heartland area would generate an additional 20% GVA per annum – equivalent to c£10bn per annum. Just as important, a failure to invest in the Heartland will result in the level of service on existing infrastructure declining making existing business activity increasingly uncompetitive in global markets. A decline in economic performance would reduce the Heartland's net contribution to the Exchequer, thereby reducing the scope for investment by Government across the UK.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

No comment.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- ***What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?***

If there was to be evidence of a proper regional distribution of investment and growth in support of London, then regional contributions to the solutions would be defensible and fair. The uplift in growth realized through delivery of both East-West Rail and Oxford to Cambridge Expressway will be significant and would need to be reflected in some way. The Alliance members already have a well-established partnership in support of East-West Rail contributing over £45m to its delivery. Furthermore, the likelihood of such an arrangement would be improved should the Alliance be

successful in its attempts to become a Sub-national Transport Body as provided for in emerging legislation.

- ***What innovative funding mechanisms could be considered to support delivery of key schemes?***

Notwithstanding the potential to deploy innovative financing mechanisms to deliver key schemes, the cost of those schemes will ultimately have to be met from one of three funding sources – the user or beneficiary of the infrastructure, local sources of funding (council tax payers or local businesses), or central Government investment.

5. *How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?*

No comment.

Electricity Interconnection and Storage

The responses in this section are based on our experience of the grid or distribution network in Oxfordshire, however they are reflective of the challenges faced across the Heartland area. The Alliance partners commitment to develop a strategic infrastructure plan reflect a recognition on their part that the issues need to be addressed at a sub-national scale

The questions below assume that the installation of renewable energy generation is proceeding unhindered so as to provoke the need for balancing of supply and demand, including deploying energy storage. Unfortunately, this is not the case.

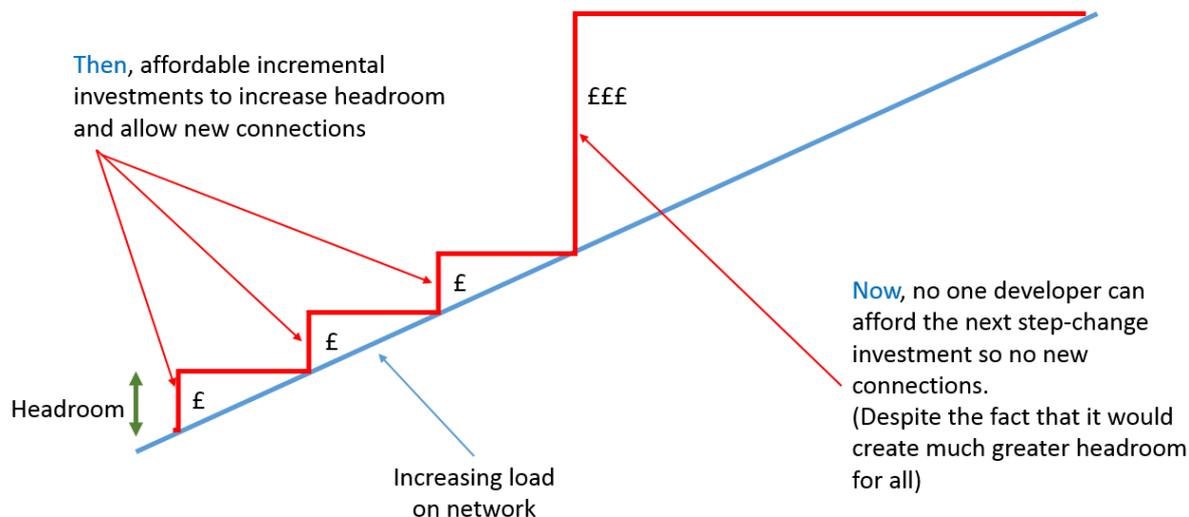

It is worth pointing out that there are two fundamental issues:

- There is an acute need to invest in renewable energy to diversify and add to current supply to meet demand; and,
- There is a need for additional capacity full stop to support large scale economic/housing growth.

The local market for connecting new renewable energy schemes to the distribution network has effectively failed. All of the sub-stations operated by Scottish and Southern Energy Power Distribution (SSEPD) across Oxfordshire for example, are constrained by fault levels. So, in practical terms, there will be no new large installations (above 50kW) in Oxford for the foreseeable future. In Bicester, there will be no new renewables, nor allocation of new supply connections until 2019 at the earliest. There are similar examples from elsewhere in the county: In November, a £240k solar PV scheme in Chipping Norton, Oxfordshire, was recently quoted a connection cost of £437k with a delay of two years, making the scheme unviable.

As elsewhere across the Heartland area, Oxfordshire's local grid needs significant investment to make it fit for the 21st century. It needs to move from a centralised energy system designed to distribute electricity in one direction to the smart system needed to manage embedded generation and storage, as well as the increasing up-take of electric vehicles. At present, this is funded by individual developers as they request a connection. We have reached the point where no one individual developer can afford the cost as shown in Figure 1 – The Investment Hurdle

Figure 1 – The investment hurdle

We also believe there is a significant information failure in this market: scheme developers are unaware of each other, making it difficult to pool resources. The Distribution Network Operator (DNO) reacts only to firm requests to connect rather than taking a strategic view based on the much wider range of information available. The Alliance suggest that the regulatory framework within which the 5-year investment plans are prepared by the operators (and approved by the Regulator) must be required to take into account the strategic growth identified by local partners. We feel the most efficient and effective way of doing this would be at a sub-national level reflecting the reality that networks extend beyond individual local authority boundaries.

The current approach is inefficient thereby increasing costs to developers – in re-scaffolding when limits on schemes size are relaxed or in abortive costs when schemes turn out to be financially unviable because of the high cost of connection.

To develop as it should, the energy grid needs mechanisms to facilitate funding in advance of a connection request, based on a strategic vision of the development of the grid. There may also be a 'public good' argument for investment in the grid, analogous to investment in other infrastructure such as roads and broadband.

The strategic vision needs to be owned by local stakeholders as much as the DNO. This requires much greater dialogue between planners, the DNOs and major users to avoid pinch-points blocking development, as is happening in Bicester with knock-on impacts on Oxfordshire's economic growth.

The Alliance suggests that an obligation should be placed on the DNO to work with sub-national bodies to identify the longer term strategic needs for additional installed capacity – and then a requirement on the regulator to take that into account when agreeing to specific 5-year investment plans. The Alliance partners are keen to work with the Commission to develop its thinking in this area with a view to shaping the remit of the Commission moving forward (and ensuring future legislation is fit for purpose).

We would also like to see greater use of the Ofgem innovation funds to help support the area's long term innovation and growth strategies. Exploring smart solutions to fault-level constraints is key as is

supporting the innovative work we are doing in the electric car market which impacts on the grid and could provide a balancing function. In this example, the electric car is part of the storage chain and adds a wider value to the energy use/storage cycle without the need for wider storage investment. This presents a huge opportunity, so reinforcing the point that forward planning must improve.

1. *What changes may need to be made to the electricity market to ensure that supply and demand are balanced, whilst minimising cost to consumers, over the long-term?*

Investors need a secure and equitable investment environment with clear long-term signals within which to plan multi-year projects that have investment and construction timescales that extend well beyond the timeframes associated with regulatory reviews. The recent reviews on rail infrastructure investment have noted the difference in terms of cost and efficiency of large scale investment schemes handled outside the 5-year regulatory framework (i.e. Crossrail and Thameslink) with those handled as part of the regulatory framework (i.e. GWML electrification) – if Government is sympathetic to shifting more strategic schemes outside of regulatory frameworks then one could see a similar approach being applied to other sectors. The Alliance wants to work with the Commission to explore this opportunity further. Without this environment, new energy supply projects will not come forward at the rate needed

At the local grid level, for example, Oxfordshire's thriving community sector is already demonstrating balancing projects which have significant potential:

- Project **ERIC** (Energy Resources for Integrated Communities) is an initiative bringing solar PV power and smart energy storage to up to 100 homes in Rose Hill, East Oxford. Project ERIC is led by Moixa Technology and Bioregional and is part-funded by Innovate UK. Using domestic Maslow batteries and a new software platform, Project ERIC aims to demonstrate how distributed storage in a community can be managed to reduce average peak grid load by 65% and increase self-consumption of local PV energy across the community by twofold¹.
- The award winning **Energy Local** project aims to use smart technology systems to pool community demand so that members can access the time of day tariff and locally generated renewable power directly, adjusting demand to reflect local generation².

The market needs to facilitate local initiatives such as these by minimising the cost and resources needed to participate. Whilst they will initially contribute to local balancing, they can of course contribute to the national balancing market at scale, which is the long term intention.

What role can changes to the market framework play to incentivise this outcome:

- ***Is there a need for an independent system operator (SO)? How could the incentives faced by the SO be set to minimise long-run balancing costs?***

There is a major need to upgrade the local grid in Oxfordshire so that it facilitates new approaches to the generation, storage and use of electricity rather than blocking them as at present. Such an upgrade will also require a change in the role of the District Network operator (DNO) to an

¹ <https://localisedenergyeric.wordpress.com/>

² <http://www.energylocal.co.uk/>

independent system operator, if not a new operator. The incentive scheme should encourage the strategic rather than reactive management of the network in partnership with local stakeholders. It could also remove the barriers in the current system which mitigate against long term strategic investment.

- ***Is there a need to further reform the “balancing market” and which market participants are responsible for imbalances?***

As above

- ***To what extent can demand-side management measures and embedded generation be used to increase the flexibility of the electricity system?***

Oxfordshire has shown that community energy initiatives, such as ERIC and Energy Local, can make a significant contribution to both demand-side management and embedded generation. In particular, the Low Carbon Hub has demonstrated that there is a strong demand for local investment opportunities. It must be recognized though that this is only part of the supply offer to meet what will be significant growth in the Alliance area.

At present, this is held back by fault level constraints and by the failure to develop a smart grid in the county.

2. What are the barriers to the deployment of energy storage capacity?

- ***Are there specific market failures/barriers that prevent investment in energy storage that are not faced by other ‘balancing’ technologies? How might these be overcome?***

Battery-based storage is still expensive. Further government investment in battery innovation, testing and de-regulation are required for example to meet the challenge of creating a step change and shift away from carbon-based engines. The Alliance area is at the forefront of this and needs continued investment to succeed.

Some energy storage devices, such as batteries, can contribute to fault levels. At present, fault level constraints in Oxfordshire and the consequent market failure limit the roll-out of such devices at scale. This basic issue needs addressing as described above.

- ***What is the most appropriate scale for future energy storage technologies in the UK? (i.e. transmission network scale, the distributed network or the domestic scale.)***

All scales are appropriate to make the best fit with the technology and source of funding eg pumped storage will work at the transmission network scale. In contrast, businesses, schools and households will invest in small-scale battery storage which in aggregate will make a significant contribution.

3. What level of electricity interconnection is likely to be in the best interests of consumers?

- ***Is there a case for building interconnection out to a greater capacity or more rapidly than the current ‘cap and floor’ regime would allow beyond 2020? If so, why do you think the current arrangements are not sufficient to incentivise this investment?***

- ***Are there specific market failures/barriers that prevent investment in electricity interconnection that are not faced by other 'balancing' technologies? How might these be overcome?***

We assume these questions relate to interconnection at the level of the transmission network and therefore have no comment.

4. What can the UK learn from international best practice in terms of dealing with changes in energy technology when planning to balance supply and demand?

How best to roll out and use a smart grid to make more efficient use of the grid asset.

The Alliance partners look forward to working closely with the Commission as it discharges its functions. If you need any further information in response to this submission please contact me on [\[email redacted\]](#)

Yours sincerely

Martin Tugwell
Programme Director

6th January 2016

National Infrastructure Commission
1 Horse Guards Road
London
SW1A 2HQ

Dear Sir/Madam,

Response to the National Infrastructure Commission Call for Evidence - future investment in the London's transport infrastructure

Enterprise M3 is responding to the National Infrastructure Commission Call for Evidence and in particular the request relation to future investment in the London's transport infrastructure.

Enterprise M3 is the Local Enterprise Partnership for an area which covers parts of the counties of Hampshire and Surrey, including north and central Hampshire, and western Surrey up to the M25. The LEP area includes major centres such as Aldershot, Winchester, Basingstoke, Woking and Guildford. In total, the LEP area encompasses over 1,600,000 residents and 86,500 businesses; accounting for nearly 20% of the South East's economic prosperity.

The LEPs remit is to support and sustain economic growth at a local level and Enterprise M3 has set out its vision, key priorities and actions in its Strategic Economic Plan, which was published in March 2014. The SEP sets out a clear vision of what the LEP and its partners plan to do over the period up to 2020/21 to create new jobs, increase the number of business start-ups and improve the productivity of local businesses. Improvements to transport infrastructure to enhance connectivity are a key part of this Plan, which identifies a series of infrastructure improvements that are part of the 'strategic ask' for transport investment, to improve connectivity within our area, to ensure that the LEP can thrive economically, maximise job creation and attract inward investment from businesses.

The work of the Enterprise M3 LEP is endorsed by government as part of its strategy for developing the UK economy and is driven by close collaborative working with local authorities, the business community and other stakeholders in the area. The Enterprise M3 Growth Deal encapsulates the priorities that have recently been agreed with government in response to the needs and priorities that we have identified with our local, public and private sector partners.

What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Enterprise M3 is particularly concerned by the potentially dismissive reference in the question to the South East as London's "commuter hinterland." If the Commission is going to achieve its aims it is essential that it recognises that the importance of the economy of the areas around London in its own right and not merely as an area that serves the needs on London. Economic success in the wider South East benefits London and indeed the whole of the UK. It is worth highlighting that the South East pays considerably more in taxes than it receives in public spending – creating a net 'profit' for the Treasury. Indeed the South East was the biggest net contributor over the 10-year period 2002-12, generating a profit of £80bn for the Treasury; this compares to London's £74.8bn over the same period.

Notwithstanding this, key social and economic challenges the LEP would highlight are:

- Meeting the Government's productivity aspirations and encouraging a higher-skilled workforce for contribute to the local economy.
- Provision of new homes and business space in appropriate locations.
- Delivery of a very large expansion in the supply of housing.
- Enhancing economic interactions and labour mobility through connectivity improvements.
- Being able to deliver transport infrastructure and capacity so that it does not act as a constraint on economic growth as well as meeting the skills and housing challenges identified above.
- Achieving certainty over expansion associated with increased airport capacity in the South East and ensuring that associated infrastructure is provided.
- Improvements to cross country road and rail routes linking South East economic areas without the need to travel via Central London reducing associated congestion.
- Better road and rail access to nationally important ports and airports to boost their attractiveness as business locations and improve connectivity to international markets.
- Reducing congestion and removing bottlenecks on strategic road corridors.
- Improved journey times on the major rail lines into London for business travellers and commuters.
- Enhancements to the attractiveness of the area for new investment, including foreign direct investment.

Improving strategic transport routes in the South East will support economic growth both nationally and locally bringing a significant return on investment for public funds. By failing to invest there is a risk of adding to the congestion, frustration and costs that businesses across the UK face when using the South East strategic transport corridors including as gateway routes to London and the South East's international ports and airports. Investment is needed to maintain the attractiveness of the area for business and to secure the delivery of key development sites, new homes, new commercial floor space and new jobs. Without strategic investment in high quality transport infrastructure London and the South East runs the risk of losing businesses to international competitors.

It is no accident that the world's leading companies see London and its surrounding areas, including the Enterprise M3 area, as the place to locate and do business. The halo effect of London supports jobs in the wider South East and the whole UK. Enterprise M3 would also advocate stronger collaborations between London and the LEP areas that surround London.

What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Enterprise M3, Coast to Capital, Solent and Thames Valley Berkshire Local Enterprise Partnerships, working closely with the local highway authorities, have jointly commissioned an economic impact study that addresses exactly this question for our area.

The work will identify, describe and quantify the economic case for improving connectivity in major strategic movement corridors across South East England.

The work is developing an economic methodology to identify and define the movement corridors. The development of the corridors will address known and forecast problems such as improved connectivity through faster and more reliable journey times. They will be prioritising the corridors, identifying potential solutions for delivering change and providing an outline business case for potential infrastructure investments. This study is due to report early later this month and the LEPs will be happy to share the results of this work with the Commission.

What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Enterprise M3 is also responding to the consultation on Crossrail 2, so attached is a copy of our response, which addresses this issue in relation to the benefits of the proposed Crossrail 2 scheme and the need for investment in other rail infrastructure on the South-West Mainline.

What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Investment in infrastructure is fundamental to achieving economic growth. Key to success in funding its provision is de-risking investment and development and creating more certainty about funding for infrastructure provision. This will ensure that the infrastructure of the area is able to support, enhance and facilitate economic growth, boost productivity and improve the standard of living.

There are many different funding models available but Enterprise M3 believes that the type of approach used to fund schemes is not as important as having certainty that funding will be available over a sustained period of time. This will ensure that infrastructure schemes can be developed, with certainty that the funding is in place for their delivery. Such certainty engenders confidence and will allow scheme promoters to commit resources to scheme development and enable businesses to plan for the future, assured that the infrastructure needed for economic growth will be forthcoming.

This is of particular important to secure housing growth and in this instance it may be that Government needs to effectively underwrite public/private funding sources, to provide a level of certainty for the accelerated delivery of housing by the private sector that is being sought.

How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

No comment

Yours faithfully,

A handwritten signature in black ink that reads "Kevin Travers". The signature is written in a cursive style with a long, sweeping underline for the name "Travers".

Kevin Travers
Project Manager Transport Enterprise M3 LEP

London's Transport Infrastructure

Essex County Council Submission to the National Infrastructure Commission Call for Evidence
11 May 2016

1. **Essex County Council (ECC) welcomes the opportunity to contribute to the national debate on transport infrastructure via the inquiry being undertaken by the National Infrastructure Commission. Improvements to transport infrastructure in and around Essex are vital to unlock growth in the London City Region and connecting London businesses and communities to these centres of economic opportunity, international gateways and key labour markets.**
2. **Given the key role that infrastructure in Essex (for example London Stansted airport, the M11, A12, West Anglia Mainline and Southend airport) play in enabling growth in the Capital, we would be delighted to provide further evidence to the Committee in person.**
3. Greater Essex connects businesses across London and the South East to world markets through airports at London Stansted and Southend and major port clusters in South Essex and Haven Gateway. It also provides a labour force of more than 149,000, contributing some over £10bn per year to the capital's economy. However, to sustain this connectivity our infrastructure needs investment.
4. The rail network in Essex that connects commuters to London and beyond is already operating at capacity, on the West Anglia Mainline [WAML] journeys between London and Stansted airport are longer than some of the flights to destinations the airport serves, reducing the attractiveness of this as a place to live, work and travel from and to.
5. Our ports are some of the largest in the Country connecting businesses to London but, without investment in the surrounding road and rail network we risk being left behind as logistic operators choose elsewhere with better, more reliable connectivity.
6. Stansted Airport is the only major airport in the Southeast that has the immediate capacity to grow within its existing permissions. It has capacity to take a further 13 mppa, from 22 mppa to 35 mppa within current planning permissions and has permissions to operate 264,000 Air Traffic Movements (ATMs) per year (243,500 passenger ATMS and 20,500 cargo ATMs) without the need for major further capital investment in the airport. However, improvements to surface access will be required.
7. Southend airport already has the immediate capacity to grow within its existing permissions. It can double from 1 million passengers per annum (mppa) to 2 mppa within current planning permissions and has permissions to operate 53,300 Air Traffic Movements (ATMs) per year without the need for major further capital investment.
8. However, whilst both airports have the capacity to grow within existing permissions and realise wider economic benefits for the London-City region, they are constrained by surface access.

9. Stansted airport is constrained by capacity on the strategic road network particularly the M11 J8, A120, M11 J8 – J9 and A14. It is further constrained by capacity, reliability and journey time of the West Anglia mainline “Stansted Express” service from London Liverpool Street. Southend airport is constrained by the capacity and reliability of the A127.
10. The Dartford Crossing is the only fixed road crossing of the Thames east of Greater London, however it is the busiest estuarial crossing in the United Kingdom, with an average daily use of over 150,000 vehicles.
11. Our response lays out our proposals on improvements to transport infrastructure in the London City-Region for consideration by the Commission and centres on opportunities in the following areas:
 - **West Anglia mainline four-tracking** - along the Lea Valley between at least Tottenham Hale and Broxbourne. However, Essex County Council supports the view of Harlow District Council that a feasibility study is required to explore the option of extending Crossrail 2 and 4-tracking to Harlow Town station. Overall Harlow has an increasingly important economy, with the success of their Enterprise Zone, and the relocation of Public Health England. At the same time the town has major ambitions around housing growth, which will support growth locally and within the London labour market. Harlow Town station also has existing and capacity for further stabling for trains. Four-tracking would provide rail capacity to bring forward the delivery of 6,000 – 12,000 new homes and 2,000 – 5,000 additional jobs to support growth along the Lea Valley and wider London Stansted Cambridge corridor and, to enable a London – Stansted journey time of 30mins.
 - **A120 corridor dualling** – we ask HM Government to consider our specific proposals on dualling the remaining sections of the A120 between Braintree – A12 and Hare Green to Harwich; the ports and logistics sector in this corridor has a turnover of £3bn per annum and employs over 32,000 people. With investment, the economy could grow by £1.3bn.
 - **Capacity improvements to M11 J8** – the junction is already at capacity and improvements would support growth at Stansted airport, unlock opportunities for local housing growth and improve connectivity between London, Stansted and Cambridge.
 - **Creation of M11 J7a** – to provide stronger links between London and Stansted airport and between the capital and the economic opportunities that exist within the Harlow Enterprise Zone.
 - **Upgrading of the M11 north of the airport between J8 – J9** – to provide stronger and more efficient links between Stansted airport, and the economic opportunities between London, Stansted and Cambridge.

- **A127 improvements** – the A127 has significant capacity and reliability issues, as highlighted in the Inner Thames Estuary [ITE] Study on Surface access, and flows which need to be addressed if it is to maintain current jobs and aid the delivery of new jobs and housing growth along the corridor. The A127 carries in excess of 70,000 vehicles per day which exceed those on many urban motorways elsewhere in the UK.

12. We are pleased that the importance of infrastructure is being considered by the Commission. Our evidence shows that there are already examples of ambitious projects based on robust understanding of local needs and that demonstrate joint working across a range of partners.

Cllr Rodney Bass
Cabinet Member for Infrastructure

Cllr Kevin Bentley
Cabinet Member for Economic Growth

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

- 1.1 Covering an area more than twice the size of Greater London, Essex has diverse strengths and is positioned to exploit an equally diverse range of opportunities. The county provides an excellent location for connecting businesses to centres of economic opportunity, including London, and internationally via the London Gateway and Harwich ports, and Stansted and Southend Airports.
- 1.2 Being so well located means that Essex is a significant contributor to growth; currently it supports 677,750 jobs; some 76,750 businesses. In 2013, Essex's businesses generated Gross Value Added (GVA) of £32.5 billion.
- 1.3 The commuting relationship between Essex and London is reciprocal; each year 149,000 Essex residents commute into London which approximates to £10.4bn GVA whilst 38,800 London residents commute to Essex which approximates to £2.7bn GVA per year¹.
- 1.4 By 2021 we are planning for over 117,745 new jobs; and over 81,310 new homes. Independent projections suggest that Essex will experience substantial demographic growth between 2014 and 2021. Analysis of 2013-based forecasts from the East of England forecasting model for the period 2014-21, suggest that Essex can expect to see growth in:
 - overall population of around 71,000 (4.9%);
 - the working age-population of 13,000 (1.4%); and
 - the number of households of some 33,000 (5.5%).
- 1.5 This amount of growth will exert pressures on our infrastructure, not only transport but education, health and social care and digital connectivity.
- 1.6 Due to the inter-connected relationship between Essex and its neighbouring counties and London growth in these areas will also affect our economy. For example the Upper Lea Valley is forecasted to generate 15,000 jobs and 20,000 new homes by 2021² whilst London Riverside is forecast to generate 16,000 jobs and 26,500 new homes.³
- 1.7 To keep businesses and commuters moving between Essex, London and beyond and ensure strong economic growth significant infrastructure investment is required:
 - improvements to surface access at Stansted airport – would enable the airport to grow its capacity;
 - the Lower Thames Crossing – would relieve congestion and speed up logistics;
 - a comprehensive solution to the lack of capacity at Junction 30/31 of the M25;
 - corridor improvements on the A12, A120 and M11 (including Junction 7a) – to connect centres of economic opportunity;

¹ Regeneris (2015) *Greater Essex External Economies Commission – Economic Linkages*

² City in the East

³ City in the East

- capacity improvements and integrated transport initiatives on the Great Eastern Mainline (GEML), West Anglia Mainline (WAML) (including 4 tracking) and opportunities offered by Crossrail 2 – to improve commuting and reduce journey times to London Stansted and London Southend airports and;
- investment in the London Underground Central Line and rolling stock, including station travel planning and interchange enhancements at Epping, Loughton, Buckhurst Hill, Chigwell and Roding Valley Stations – to improve commuting and support the night-time economy.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- **How should they be prioritised, taking account of their response to London’s strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

2.1 We believe that future investment in large-scale transport infrastructure improvements in Essex will support growth in London and across the South East.

2.2 Essex County Council has identified four growth corridors where investment could help stimulate and support growth:

- London Stansted Cambridge Corridor (M11 and West Anglia Mainline)
- Haven Gateway (A120)
- Heart of Essex (A12 and Great Eastern Mainline)
- Thames Gateway South Essex (A127, A13 and Essex Thameside Mainline)

London Stansted Cambridge Corridor (M11 and West Anglia Mainline)

2.3 The west of Essex is part of the London-Stansted-Cambridge Corridor (LSCC), connecting London, Stansted and Cambridge, via the M11 and the West Anglia Main Line (WAML). The Corridor has enormous growth potential, particularly in Harlow, building on the local strengths in life sciences and other high value sectors for example Public Health England is moving its headquarters to Harlow.

2.4 London Stansted is the only airport in the South East with immediate capacity for significant growth. With a current planning application to support 35m passengers per year (up from 20m currently), there is capacity to increase this to 45m passengers per year by 2030. This could create an **extra 10,000 jobs** and **£4.6bn in additional economic activity**.

2.5 London Stansted airport is already successful in the leisure and tourism but future plans focus on attracting more business customers and increasing the number of long haul flights. The growth of both of these areas could provide a catalyst for growth across the East of

England, attracting inward investment and supporting key sectors such as life sciences (amongst others).

- 2.6 London Stansted is also a key handler of freight, handling 220,000 tonnes last year (the third biggest after Heathrow and the East Midlands) and there is potential with surface access improvements to grow this market as well.
- 2.7 Surface access improvements are critical to growth at Stansted Airport. The Airport will not be able to realise its true potential without investment in the following:
- M11 improvements focusing on junctions 7 and 8
 - A120 improvements, improving connections between the Haven Ports and the Airport
 - Four-tracking of the West Anglia Mainline, which will result in faster journey times from London
- 2.8 The Harlow Enterprise Zone provides a focal point for key sectors of significance to the UK and sub-regional economy including life sciences, advanced manufacturing and ICT with the potential to deliver over 51 hectares of employment land. Delivery has the potential to create over **5,000 jobs** and lever in over **£150 million in private sector investment**.
- 2.9 Improvements to M11 J7 and delivery of M11 J7a are required to realise the site's full potential.
- 2.10 It is hoped that Crossrail 2 will bring the desperately required four-tracking of the West Anglia Mainline to the London Stansted Cambridge Corridor and this should be prioritised.

Haven Gateway (A120)

- 2.11 The Haven Gateway Growth Corridor includes the districts of Braintree, Colchester and Tendring, and links Harwich International Port in the east to Stansted Airport and the M11 in the west via the A120. It is one of the key international gateways to the UK; home to Harwich International Port, one of the UK's leading multi-purpose freight and passenger ports, and supporting the neighbouring port of Felixstowe.
- 2.12 There is significant potential for growth at Harwich Port. Harwich has the potential to make a significant contribution to the offshore energy sector and is already supporting over 260 turbines, more than any other UK North Sea Port. It is well located at the centre of Europe's offshore wind activity and provides the sheltered conditions to support the growth of the offshore renewable sector. Harwich has recently been designated as a Centre for Offshore Renewable Engineering (CORE). This will provide additional support for businesses looking to invest in manufacturing for the offshore renewable energy industry, helping this sector to grow.
- 2.13 In the longer term, Bathside Bay has the potential to create a deep sea container port with road and rail links to the rest of the country. Around 101h additional land adjacent to Harwich Port is available which could attract **£300 million investment** and create at least **500 direct jobs** and many more indirect employment opportunities.

- 2.14 The **A120** links London Stansted Airport with Harwich International port and the local economies of Braintree and Colchester. Improvements along this route has significant potential to secure employment and housing growth along this corridor. It will connect the local workforce to two key international gateways and drivers of growth for Essex. Without the required improvements to the A120, the region will lose out on £1.3bn in growth and nearly 13,000 new jobs.
- 2.15 ECC is leading on the design and preparatory work for improvements to the A120, however firm commitment from Government to fund the scheme is required to ensure success.

Heart of Essex (A12 and Great Eastern Mainline)

- 2.16 The Heart of Essex growth corridor runs through the centre of Essex, linking London to the Haven ports, and onwards to Norfolk and Suffolk. The A12 and the Great Eastern Main Line (GEML) rail services link the key urban centres of Brentwood, Chelmsford, Colchester and Maldon to London.
- 2.17 The corridor has strong links with the London labour market, supporting substantial commuter flows to and from the capital. These links will grow and strengthen as Crossrail is completed, when new services will stop at Brentwood and Shenfield, both of which will benefit from planned improvement works to facilitate these new services
- 2.18 Additional investment in rail and road infrastructure is essential for unlocking the full economic potential of the Corridor, and a package of investment is proposed to address bottlenecks on the A12 to support growth.

Thames Gateway South Essex (A127, A13 and Essex Thameside Mainline)

- 2.19 The districts of Basildon, Castle Point and Rochford, along with the unitary authorities of Thurrock and Southend, form Thames Gateway South Essex (TGSE); part of Thames Gateway, the largest regeneration opportunity in Europe. Along this corridor the A13 links the key port infrastructure of Tilbury and London Gateway with London, while the A127 corridor connects the capital to the manufacturing hub of Basildon, and to Rochford, Southend, London Southend Airport and surrounding employment areas. Improvements to the road network in this area are vital to securing growth and inward investment.
- 2.20 London Gateway is the UK's first major deep sea container port and Europe's largest logistics park. It will provide access to the largest consumer markets in the UK and internationally. A significant port development for the UK, it occupies a 1,500 acre site and will provide 2,700 metres of quay and six deep water berths. The logistics park could provide nearly 1 million m² of accommodation. Together the development has the potential to create more than 12,000 direct, permanent jobs and more than 20,000 indirect jobs. The site is supported by the country's largest Local Development Order, developed by Thurrock Council to give confidence to occupiers to invest.

- 2.21 Port of Tilbury is one of the largest deep water ports on the River Thames and is the UK' leading port for forestry products with excellent links throughout the supply chain including shipping lines, importers, merchants and distributors. Work is currently underway to develop more than 940,000 sq. ft. of new high quality distribution facilities and 17 acres of haulage facilities adjacent to the port of Tilbury. The London Distribution Park development is expected to generate up to 1100 jobs and secure the long term prosperity of the port.
- 2.22 London Southend Airport has been one of Europe's fastest growing airports in recent years with over 1 million passengers in 2014. It has received over £130 million of investment since it opened in 2008, mainly from the private sector. A Joint Area Action Plan (JAAP) sets out detailed proposals for the development of London Southend Airport and the surrounding area. The Airport itself has capacity to support up to 5 million passengers per annum and 2 million by 2030. By 2021 it is expected that the airport will support an additional 2,000 jobs.
- 2.23 There is significant potential for growth, not only at the airport site but in areas surrounding this key hub. The Airport Business Park (ABP) to the North West of the Airport will create a million sqft of high quality employment space and over **6,000 jobs**. The proposals include a site for the Anglia Ruskin Medtech campus, which will create space and support for businesses in the medical technologies sector.
- 2.24 Currently, development is constrained by the limited capacity of the strategic road network, particularly J30/31 of the M25 and the dual carriageway stretch of the A13. The A127 also carries a volume of traffic comparable to a motorway in other parts of the country and has significant capacity issues which need to be addressed, particularly around Basildon, London Southend Airport and the Southend Central Area. Southend Borough Council and Essex County Council have developed a joint "A127 Corridor for Growth" economic plan to identify, plan and coordinate investment decisions and manage the asset.
- 2.25 The **A127** corridor which connects Basildon with Southend is vital to the economic competitiveness of the Thames Gateway South Essex sub-region and indeed to the economy of the County of Essex and beyond. It is located in the heart of the Thames Gateway which has been identified as being of national significance. Thames Gateway South Essex has an ambitious growth agenda to build on existing strengths and make the most of a unique combination of opportunities. Investment to improve capacity and flows along the A127 is therefore required to secure jobs and housing growth.
- 2.26 Bordering London to the west, the **A13 corridor** links the key port infrastructure of Tilbury and London Gateway with the capital. The corridor provides a significant growth opportunity and already benefits from major planned and committed private investments such as London Gateway (£1.5bn), Thames Enterprise Park (£1bn), Lakeside (£1bn), Purfleet (£600m) and Canvey Gateway (£110m). With the right investment, the A13 corridor will deliver 4,150 homes and 11,000 jobs by 2021. However, the road is currently constrained by its capacity. To unlock this growth potential, local authorities will invest £300m, however additional funding is required (in the region of £87 million).

2.27 Furthermore, the potential impact of the Lower Thames River crossing would be significant on transport routes in this corridor, with one of the two short-listed options being to connect the M2 in Kent with the A13 and the M25 between junctions 29 and 30.

2.28 In summary our priorities for investment are:

- **A127 improvements** – the A127 has significant capacity and reliability issues, as highlighted in the Inner Thames Estuary [ITE] Study on Surface access, and flows which need to be addressed if it is to maintain current jobs and aid the delivery of new jobs and housing growth along the corridor. The A127 carries in excess of 70,000 vehicles per day which exceed those on many urban motorways elsewhere in the UK.
- **Lower Thames Crossing** – another crossing is required to ease congestion across the Queen Elizabeth II Bridge and provide resilience in the area.
- **A120 corridor dualling** – we ask HM Government to consider our specific proposals on dualling the remaining sections of the A120 between Braintree – A12 and Hare Green to Harwich; the ports and logistics sector in this corridor has a turnover of £3bn per annum and employs over 32,000 people. With investment, the economy could grow by £1.3bn.
- **A12** – we are working closely with Highways England to design the improvement schemes announced in the 2014 Autumn Statement.
- **Creation of M11 J7a** – to provide stronger links between Stansted airport and the economic opportunities that exist for Growth within the Harlow Enterprise Zone.
- **Capacity improvements to M11 J8** – improvements on this already at capacity junction would support growth to Stansted airport as well as providing opportunities for housing growth locally.
- **Upgrading of the M11 north of the airport between J8 – J9** – to provide stronger and more efficient links between Stansted airport, and the economic opportunities that exist for Growth within the Harlow Enterprise Zone, Cambridge and wider region.
- **West Anglia mainline four-tracking** - along the Lea Valley between Tottenham Hale and Harlow to provide rail capacity to bring forward the delivery of 6,000 – 12,000 new homes and 2,000 – 5,000 additional jobs to support growth along the Lea Valley and wider London Stansted Cambridge corridor and, to enable a London – Stansted journey time of 30mins.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

3.1 We believe that delivering four-tracking of WAML outside of the Crossrail 2 programme would lead to an increase in benefits as commuters and airport passengers could travel more easily and reliably to and from the capital.

3.2 Further, there is potential to reduce costs by undertaking a scoping study into extending four-tracking and Crossrail 2 services to Harlow Town Station where there are marshalling and servicing facilities for trains already present that TfL could use.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

4.1 We have a strong track record in forward funding and part funding large scale infrastructure projects and would be happy to share this knowledge and experience with the Commission.

4.2 As well as leveraging investment from local authorities, businesses, developers and (in the case of rail) operators we see no reason why additional taxation (enabled by Business Rate Legislation) could not be used to part fund significant infrastructure projects such as Crossrail 2 or a new Lower Thames Crossing. This has already been successfully applied for the funding of Crossrail and the London Olympics.

4.3 There is a robust evidence base to support the use of user charging to recoup the construction costs and pay for ongoing maintenance of road and river crossing infrastructure projects. This approach should not be discounted.

National Infrastructure Commission – Call for Evidence

Subject: London’s Transport Infrastructure – **Connecting East London – Low Level River Crossings**
To: National Infrastructure Commission (londonevidence@Infrastructure-Commission.gsi.gov.uk)
Prepared by: Farrells and BuroHappold Engineering
Date: January 7th, 2016

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London’s population growth has accelerated to an extent much greater than anticipated, to a Victorian rate of change. A year ago, London’s population surpassed its 1939 peak of 8.6 million and latest predictions foresee London’s population exceeding 10 million by 2035. This creates opportunities, but also brings with it major challenges. London is one of the most thriving and growing urban economies. It is a centre for innovation, creativity, and culture. In order to remain the global city London is today and to lead the world in sustainable, resilient urban growth, London however needs to address its ***most pressing challenges: Housing and infrastructure provision for a growing population and economy, social and economic inequality, and the impacts of climate change.***

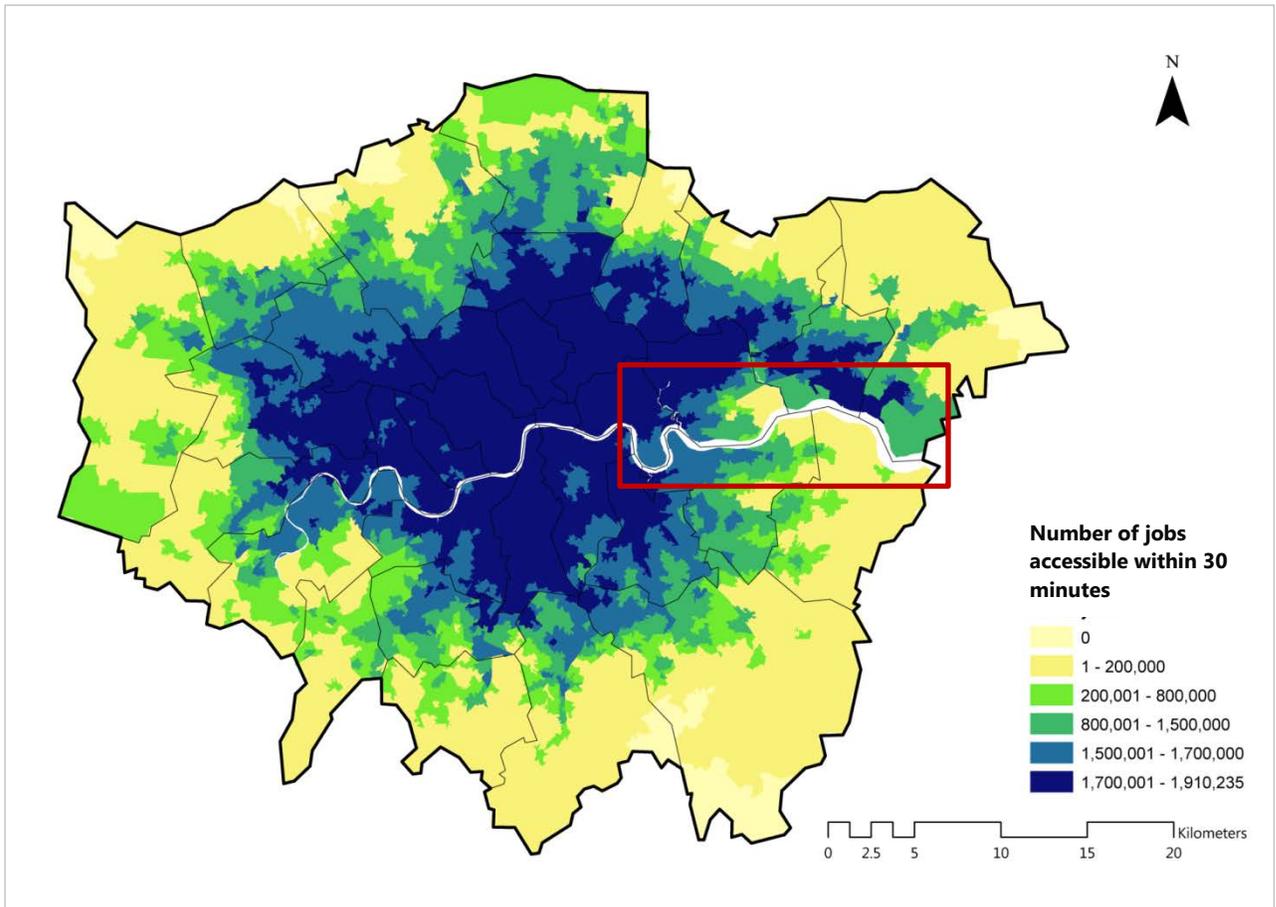

Providing ***housing*** for those already in London and its future population growth is one of the key challenges that London faces today. Official estimates assume the need to build almost 50,000 homes a year over the next twenty years, supply levels far beyond those currently achieved. With local authorities reducing or abandoning their housebuilding activities since the early 1990s, the private sector and housing associations have not managed to build more than 20,000 units per year on average. Moreover, London needs to provide these ***homes for all income levels***. Around 70% of all homes need to be affordable – social rented housing, intermediate housing, and housing in the lowest market band – according to estimates. London has only managed to build around 2,000 homes for social and affordable rent per year since 2008.

Solving the housing crisis is as much about new housing policy, innovative financing and governance mechanisms, and technical innovation as it is about ***spatial planning and unlocking land for development***. The GLA and TfL have responded to this with bold infrastructure projects, from the London Overground to Crossrail; and there are further ambitious plans (e.g., Crossrail 2) to increase accessibility of underserved areas in London. This will support both employment creation and home building at increased density. However, more needs to be done, across London

In recent times it has become clear that only **East London** has the spatial capacity and ability to accommodate growth on a larger scale. Shoreditch and Hackney have become desirable places to live and work whilst Canary Wharf has become a major finance centre with a mix of shops, homes, and a cultural offer with superb connectivity. The London Olympics Legacy has helped support growth in Tower Hamlets and Newham and the Royal Docks is at last attracting sustained investment. However, large areas of East London have seen little or no growth. A lack of transport accessibility (see Figure 1) has held back housing delivery in

East London and too much has consisted of low-density sprawl in featureless dormitory suburbs. While the London Plan identifies East London as the area with the greatest potential for growth (40% of the opportunity areas), it will be hugely challenging to find investors if land is not unlocked by making it more accessible to employment throughout London and the south east.

Figure 1: Accessibility to jobs

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

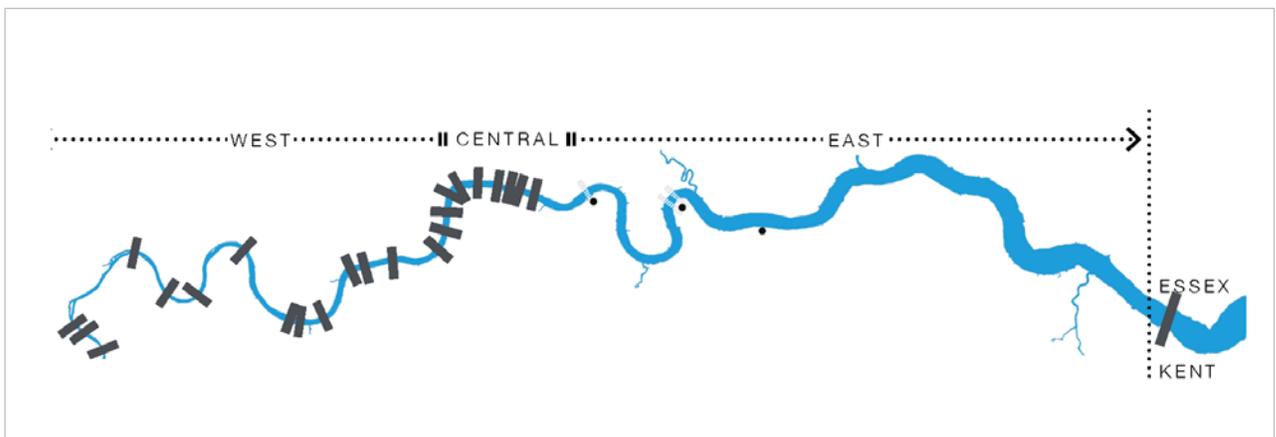

To address the challenges outlined above, **new river crossings in East London** should be part of any future investment in infrastructure improvements. TfL has started investigating different options and is preparing for the planning and construction of strategic through traffic crossings such as the Silvertown Tunnel, a crossing at Gallions Reach, and one at Belvedere. While necessary, these crossings will however not be sufficient to address the local accessibility needs of local communities that are being planned and built in East London. Moreover, these crossings – currently conceptualized as tunnels and high-level bridges – will sterilize large areas of land on either side of the river due to their long approach ramps, often stretching a mile back from

the river bank. Future investment in transport infrastructure therefore needs to include the building of **low-level bridges and other local crossings such as high frequency ferry services in East London**, enabling walking and cycling and conveniently connecting people to transport nodes on either side of the river – effectively extending the network of transport connections to the river.

Historically, West London grew and flourished because areas north and south of the river were connected by bridges, improving connectivity and unlocking new land for development. To provide one example: In 1842, the Commission of Woods, Forests, and Land Revenues recommended “the building of an embankment at Chelsea to free new land for development, and proposed the building of a new bridge downstream of Battersea Bridge” (Roberts, C. 2005. Cross River Traffic. London: Granta, p. 130).

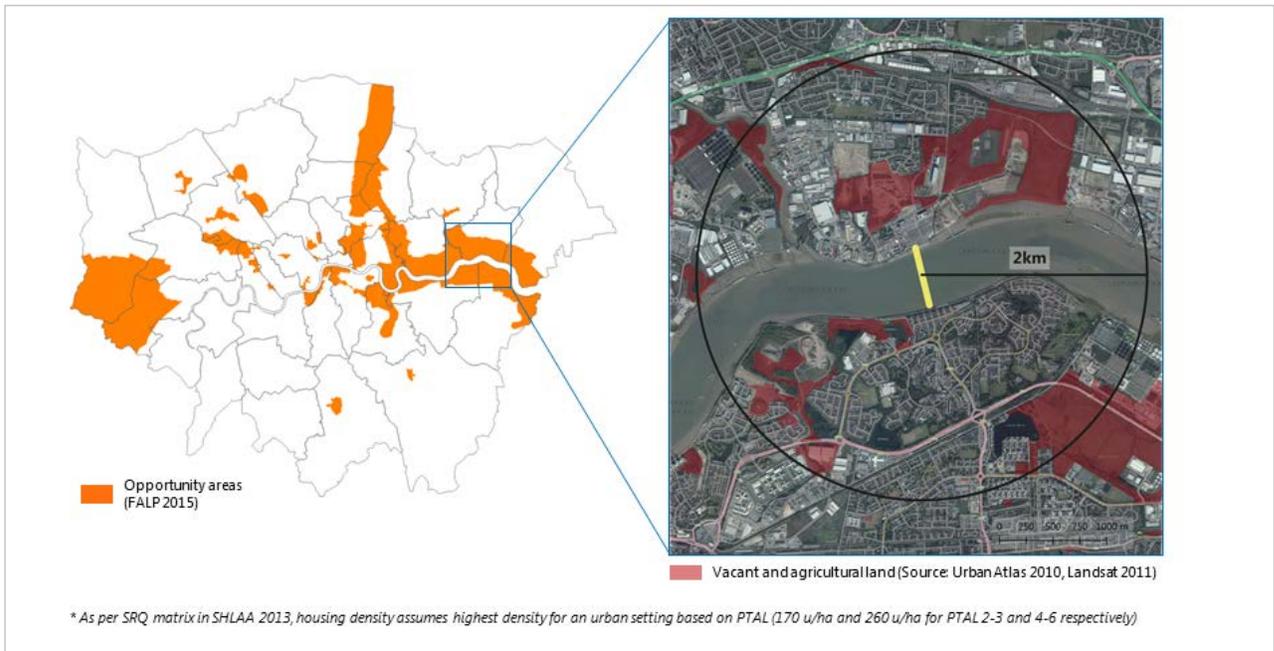

Currently, there are 34 bridges across the Thames, but **only one bridge east of Tower Bridge** – the high-level bridge at Dartford (see Figure 1).

Figure 2: Bridges across the river Thames

Building local crossings will help unlock land for housing development and improve job accessibility for existing and future communities. Analysis suggests that within a 2km radius of a potential bridge connecting Thamesmead with Barking Riverside, almost 50,000 new homes could be built (see Figure 3) – this is one year of the housing supply currently required for London’s growth. A bus connection over the bridge that would link Abbey Wood Crossrail station in the south with the future Barking Riverside Overground station in the north would increase job accessibility for existing and future communities in the area.

Figure 3: Housing capacity in Thamesmead / Barking Riverside

Low-level bridges will allow private and public developers to take advantage of increases in land value to **create vibrant urban communities** along the river front and further inland. It will re-connect settlements on the North and South banks with the Thames and **enhance the East London riverfront** through landscape restoration and the animation of the waterfront with shops, cafes, and public spaces for people to linger, walk, and enjoy. This addresses one of the key goals in the current Port of London Authority Vision (i.e., "Riverside as a magnet for ramblers, historians, artists, and others", PLA Thames Vision Consultation on Goals and Priority Actions, Dec 2015).

Low-level bridges will also help **reduce pressure on over-burdened parts of the transport network** by **providing sustainable alternative modes of transport**. With the development under way in North Greenwich and the Royal Docks, a low-level bridge could increase crossing capacity. TfL's *River Crossings: East of Silvertown Crossings* (Jul 2014) report demonstrates the need to increase capacity of the Woolwich Ferry crossing. It also shows that this crossing is mainly used by people originating in the boroughs north and south of the river. A low-level bridge will reduce the pressure on the Woolwich Ferry. It will also help achieve TfL's goal of reducing dependence on road-based transport and improve air quality. The same report indicates that road-based travel in East London is the main transport mode in connecting people to employment. Low-level crossings will improve the infrastructure for alternative modes of transport such as walking and cycling.

We are fully aware of the **challenges that low-level bridges pose to river traffic**. The River Thames poses several constraints due to its topography and its tidal nature. It requires highly experienced pilots to manoeuvre ships and the more obstacles in the river, the more difficult it becomes to manoeuvre. We are also aware of the cultural, environmental, and economic importance of the river traffic. In 2014, the port handled 44.5 million tonnes of goods and materials and provided direct employment for 27,000 people. 5.5 million goods and materials were moved between the wharves on the river, taking 550,000 lorry trips off the region's road (PLA Thames Vision Consultation on Goals and Priority Actions, Dec 2015). This reduces congestion on London roads, increases road safety, reduces greenhouse gas emissions, and improves air quality.

Taking these challenges into account, we however strongly believe that by exploiting today's smart traffic systems and the variety of designs for opening bridges, **both interests can be served; creating vibrant communities in East London while achieving PLA's goal of being the busiest ever Port of London.** Examples of other cities might be able to teach us something (see section 5 below).

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Low-level bridges **can be more affordable** than high-level bridges and tunnels. Rough costing of a potential bridge between Thamesmead and Barking Riverside allowing for cycling lanes, walking space, and a one-way bus lane supported by sensors and lights showed that bridge construction between banks could be under £150 million – about fifty percent less than a high-level bridge (this does not include additional costs beyond the banks with approach works and ramps). This would potentially also be cheaper than TfL's idea of an Overground tunnel extension from Barking Riverside to Thamesmead (TfL, *New river crossings for London*, Dec 2015). A more detailed analysis and costing would of course have to be undertaken in order to move forward.

One of the fundamental principles that should govern infrastructure funding is that those that benefit most, should help pay for it. In regards to a low-level bridge, this **benefactor-pays** principle can be achieved through tolls by those using the bridge (especially if vehicles are allowed), land value capture mechanisms whereby land owners and developers are charged a fee as they are benefiting from increasing property values, or through business rates whereas businesses that profit from increased economic activity are charged a fee. The appropriateness of each of these financing mechanisms depends on the users the bridge serves (e.g., public transport, private vehicles) and the location (e.g., it might be easier to get funding from developers in locations where investment interest is already existent than in locations where land still needs to be unlocked).

There is also a **rationale for public investment** as the socio-economic benefits of regeneration in a traditionally deprived and underserved area as well as the opportunity to unlock land for much needed housing largely outweigh the costs involved. Contributions from national government and the GLA would demonstrate their commitment to a more balanced growth in London. Boroughs could make contributions as they will benefit from tax revenue growth from increased economic activity and population growth.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

While we appreciate that each city deals with different opportunities and challenges and each river has different physical constraints, there are examples that show how local bridges can improve accessibility and unlock development and how the technology of opening-bridges can work in other cities.

Baakenhafen Bridge, Hamburg

The Baakenhafen bridge in Hamburg is a local vehicle, pedestrian, and cycling bridge that connects two areas of the new district Hafencity and greatly increases accessibility to Hamburg's inner city. The construction of the bridge allowed for the development of 1,800 housing units, shops, offices, and community spaces. Without the bridge, development would have been much harder to achieve.

Ponte della Musica, Rome

The Ponte della Musica crosses the river Tiber in Rome and connects the former Olympic stadium on the west bank of the river with the Quartiere Flaminio for the first time in a 1,000 years. The bridge was designed to

serve as an open public space that can be used for festivals, exhibitions and fairs. It also has the facility to operate as a tram and bus route. It connects Rome's most significant cultural institutions and provides ease of access for residents to enjoy these institutions fully.

The New Botlek Bridge, Rotterdam

The new Botlek bridge across the Oude Maas in Rotterdam is an example of advanced bridge technology. It is one of the largest moveable bridges in the world. The bridge will be opened around once every hour, or 9,000 times per year and only 120 seconds are required for the entire opening or closing procedure. The bridge will remove a bottleneck for ships, caused by the existing low and narrow moveable bridge's limited navigation clearance while also improving the flow of road traffic.

Kattwyk Bridge, Hamburg

The Kattwyk bridge across the South Elbe in Hamburg is an opening bridge across a tidal and curvy river that opens during the day every two hours for river traffic. Built back in the 1970s, the opening mechanisms is not as fast as the new Botlek bridge and disrupts vehicle traffic across the river for about 15-20 minutes each time.

January 2016

Dear Sir/Madam,

National Infrastructure Commission: Call for Inputs

FSB welcomes the opportunity to respond to the above named consultation.

The FSB is the UK's leading business organisation. It exists to protect and promote the interests of the self-employed and all those who run their own business. The FSB is non-party political, and with around 200,000 members, it is also the largest organisation representing small and medium sized businesses in the UK.

Small and medium-sized businesses make up 99.9 per cent of all businesses in the UK, and make a huge contribution to the UK economy. They account for 47 per cent of private sector turnover and employ 60 per cent of the private sector workforce.

Transport infrastructure is vitally important to small businesses across the country. Small business owners in the North, London and across the UK report a range of challenges they face which are hindering the economic development of their business. If the National Infrastructure Commission is able to improve the planning and delivery of major infrastructure projects, small businesses will have greater opportunities to expand and compete internationally.

We trust that you will find our comments helpful and that they will be taken into consideration.

Yours sincerely,

Mike Cherry, Policy Director, AIMMM FRSA

FSB

FSB response to the National Infrastructure Commission: Call For Inputs

January 2016

The evidence submitted to this call for inputs is primarily based on surveys carried out on a survey panel of our members. The FSB Big Voice survey panel is made up of nearly 6000 small business owners, who are regularly surveyed on a range of different policy issues. This survey panel is broadly representative of the wider small business community. Surveys are administered by an independent research agency which is a signatory of the Market Research Society's Code of Conduct.

FSB also receives views from our members via a federated regional structure which allows small business owners across the country to raise areas of concern to them at a national level. For the purposes of responding to this call for inputs, we spoke to representatives of the FSB in regions across the North and in London, in order to ensure we accurately represented the views of small business owners.

CONNECTING NORTHERN CITIES

1. To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?

Improving the transport connections in the North is a top priority for FSB. Weakness in transport connectivity is holding back growth among small businesses in northern city regions.

The agglomeration benefits which firms in London and the South East derive from a generally strong transport infrastructure are not delivered for smaller businesses across the North. This makes it increasingly difficult for smaller businesses in the North to compete. Without further investment in transport infrastructure to bring Northern regions together, it will remain challenging for smaller businesses to develop in the North.

The APPG on Small Businesses – supported by FSB - published a report into the drivers of productivity in March 2015. This inquiry took evidence from a range of different stakeholders, finding that a lack of transport connectivity hindered productivity levels in different regions.¹

We would highlight the wide discrepancies in per capita infrastructure spending between the North and other regions of the UK which have been found by IPPR North.² This points to a broader issue with historic levels of under-investment in northern infrastructure having left the region relatively underdeveloped and with poor intra-regional connectivity.

Small business owners have also pointed to a lack of transport infrastructure as holding back their ability to connect with suppliers, customers and employees, particularly in rural areas. The declining quality of public transport and generally poor upkeep of the minor road network

¹ APPG on Small Businesses Report on Productivity: Available at http://www.millionplus.ac.uk/documents/All_Party_Parliamentary_Small_Business_Group_Productivity_and_Small_Firms_productivity_report.PDF

² IPPR North, Transformational Infrastructure for the North, August 2014

has meant that rural small businesses can struggle to compete against national and international competitors which have access to superior transport networks.

We would therefore urge the Commission to not just focus on urban and city to city transport infrastructure, but also to consider travel to work routes between cities and the rural hinterlands where many small businesses, their customers and their employees are based.

2. What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.

In a recent survey, FSB asked small business owners what modes of transport were of importance to their business. The results were as follows:

Table One: How important are the following modes of transport to your business?³

	Car	Van	Lorry	Bus	Train	Walking	Cycling
Important	93%	64%	49%	32%	33%	39%	22%
Unimportant	2%	12%	20%	27%	28%	24%	32%

We also asked how important road access was to their business, and how important the public transport network was to their business.

Table Two: How important is the road network / public transport access to your business?⁴

	Road network	Public transport
Important	88%	36%
Unimportant	3%	30%

It is clear that the vast majority of small businesses still rely heavily on the road network for their cars, vans and lorries. This is reflected in the high importance attributed to both the road network and for private car, van and lorry use.

However, public transport is important to a significant percentage of small business owners, where over a third still place value on access to public transport. Close on half of businesses in urban areas (48%) were likely to view public transport as being important, reflecting the benefits that a well functioning urban public transport network can provide.

³ FSB Big Voice survey, Rural Transport, September 2015. Base 1352 responses

⁴ FSB Big Voice survey, Rural Transport, September 2015. Base 1352 responses

For reference, and outside the scope of this section of the call for inputs, 65 per cent of London based businesses value the public transport network, providing further evidence that where public transport works, it provides an important service for small businesses.

Investment in the road network is therefore the most important priority for small business owners. This should not simply reflect investment in the Strategic Road Network or city to city links, but should also include the minor roads which form a key part of the door to door journey for small business owners, their suppliers and their employees.

We also note that many inter-city rail connections continue to rely on old rolling stock and carriages which can hinder capacity. Making additional investment in upgrading the rolling stock used on these routes could be more effective in increasing capacity than making larger scale investments in new or upgraded routes.

3. Which city-to-city corridor(s) should be the priority for early phases of investment?

FSB has argued in previous submissions to the Chancellor that a new tunnelled, trans-Pennine road route between Manchester and Sheffield would provide an important new city-to-city corridor in the North.

Many small businesses are not however based in cities, and do not necessarily place high value on access to city-to-city corridors. Instead, they look to the transport network to connect rural and semi-urban areas to city and town centres.

There is widespread concern among small businesses that new devolution deals will primarily benefit cities rather than the rural hinterland. It is important that existing, and future, devolution deals include mechanisms to ensure that the needs of rural areas are also addressed.

Small business owners in the North East also raised concerns that the 'Northern Powerhouse' will be primarily focussed on the Manchester-Leeds corridor. In their view, this would be a mistake as much-needed investment in the North East, including around Newcastle, would be missed. East to West connectivity across transport modes is as important to increase agglomeration benefits as connections through to London are.

As a federated organisation, FSB has not taken a position on specific infrastructure projects or city to city corridors, as small business owners across the North have told us that the general state of poor transport infrastructure is hindering the growth and economic potential of their business.

4. What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?

The top priority for FSB in terms of international connectivity is to improve runway capacity in the South East. We recognise that this is a decision which has been specifically excluded

from the remit of the National Infrastructure Commission. Setting aside the question of overall aviation system capacity, it is clear that more should be done outside the South East to improve international connectivity.

Whilst aviation is a lower priority for small businesses compared to the road and rail network, some small businesses do see it as important. FSB asked small business owners about how important air travel was to their business in a 2013 survey.⁵

This survey found that 27 per cent of small businesses placed at least some importance on aviation for their businesses. This importance could reflect the importance of access to freight opportunities, but could also reflect the value that some sectors, such as the tourism industry, place on aviation access. Other small business owners, especially those who export, will also often need to fly in order to meet with potential or existing clients and suppliers. Therefore continued improvements to regional airports and the destinations they serve is important.

A key issue which has repeatedly been raised is delivering improvements to surface access connectivity to airports. For small business owners, the time taken to complete a door-to-door journey is critical. This means the length of time taken to access any given airport is given weight when deciding on which airport to travel from. Business owners were especially critical of the poor surface access to Leeds-Bradford airport, which was viewed as a particular impediment in choosing to fly from there. Drop off charges at this airport are also expensive, which increases the cost of flying from this airport. The Commission should look to prioritise improvements to surface access to regional airports across the North as a key way to incentivise further export growth.

Digital infrastructure plays a key role in developing international connectivity

Digital connectivity does not appear to be within the scope of the Commission at the current time. We view this as a mistake, as digital connectivity is now critical to allowing small businesses to trade overseas. FSB has published extensive research looking at the benefits of digital connectivity, along with the barriers stopping small businesses from doing more online.^{6,7} Ofcom have echoed our findings that a lack of digital infrastructure is a key barrier stopping small businesses from making full advantage of the benefits offered by using digital tools.

As a consequence, we believe the Commission should consider investigating the provision of digital infrastructure, particularly to small businesses, as a future priority.

5. What form of governance would most effectively deliver transformative infrastructure in the north, how should this be funded and by whom, including appropriate local contributions?

⁵ FSB The Voice of Small Business survey panel, Infrastructure Survey, April 2013

⁶ FSB, Reassured, optimised, transformed: driving digital demand, September 2015

⁷ FSB, The Fourth Utility, July 2014

One concern which has been raised following the creation of Transport for the North and the National Infrastructure Commission is the precise breakdown of roles and responsibilities for planning and delivering transport infrastructure in the North. The role of local councils, LEPs and combined authorities also may need clearer definition following these changes.

The failure of the Government to follow the recommendations of the Davies Commission on airport capacity raises broader issues about the effectiveness of a Commission-led model to deliver transformative infrastructure. If the Government is under no obligation to follow the recommendations of the National Infrastructure Commission, we are concerned that future Governments will simply erect barriers to avoid making a definitive judgement on any recommendations from this body. Without some form of safeguard such as a legal obligation to respond to recommendations within a certain timeframe we are unsure that the Commission will be effective.

Small business owners would like clarity over which body is best placed to address specific areas of concern aside from which body will be responsible for the delivery of transport infrastructure.

FSB has been generally supportive of the new devolution deals which are being created, and views the creation of strong combined authorities with the power and accountability to deliver local priorities as an important and welcome change.

However, one challenge for these new authorities will be the varying levels of power which has been devolved to them. For instance, in the transport space, some combined authorities have power over buses in their area, whereas others do not. As combined authorities proliferate, there is a risk that effective planning across regions may be hindered as different combined authorities have different powers to address different issues. This was viewed as a particular problem in the North East, where the lines of accountability and authority between national Government, combined authorities and Transport for the North were viewed as unclear.

A second challenge facing combined authorities is that stronger, more effective combined authorities will be better placed to compete for funding streams. While this makes sense from an accountability perspective, business owners are concerned that their region may miss out on investment opportunities if their combined authority consistently fails to put in competitive bids for funding. Regions or rural communities outside of combined authority areas similarly may be disadvantaged when competing for limited investment opportunities.

At the same time, we recognise that if a combined authority is able to make a strong case for investment in transport infrastructure in a particular region, this suggests they may be better positioned to effectively manage the delivery of infrastructure. The National Infrastructure Commission should play a role in ensuring that new projects are effectively prioritised to provide the greatest economic benefit to the country.

LONDON'S TRANSPORT INFRASTRUCTURE

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

FSB have published a London manifesto ahead of the 2016 Mayoral Election which sets out our policy priorities for the next London mayor.⁸ This manifesto highlights some of the challenges which small businesses in London are currently facing with regards to transport infrastructure.

Commercial and residential rents are increasing the pressure on the transport network

As commercial rents increase across London, we are concerned that small businesses will increasingly be priced out of prime locations, particularly those in central London. This will affect the ability of small businesses to access the economic benefits offered by being based in London.

Recent FSB surveys have also shown that there is considerable concern among small business owners about the cost of housing in the capital. 22 per cent of small businesses said that the cost of housing had negatively impacted their business over the past four years; 13 per cent said high housing costs had impacted their ability to retain staff and 7 per cent said it had affected their level of productivity.

Permitted developments rights, which have been encouraging the change in use for commercial buildings to residential properties will only serve to exacerbate the issue.

Assuming that house prices continue to push Londoners further away from the main areas of employment, small businesses will rely even more heavily on a robust, effective and integrated transport system to carry commuters to their places of work.

Capacity on London public transport is also becoming a constraint on growth opportunities

As London's population increases, capacity on the London transport network will similarly become increasingly constrained. This again will have a detrimental effect on the ability of small business employees to travel to and from work.

Public transport is very important to London-based small businesses, as this is a key way for customers, suppliers and employees to access business premises. Owing to London's dense public transport system, small business owners were significantly more likely to view public transport as more important to their business compared to business owners in the rest of the country.

⁸ FSB London manifesto, November 2015. Available at [HTTP://WWW.FSB.ORG.UK/DOCS/DEFAULT-SOURCE/FSB-ORG-UK/FSB_A4_LONDON_MAYOR_MANIFESTO.PDF?SFVRSN=0](http://www.fsb.org.uk/docs/default-source/fsb-org-uk/fsb_A4_LONDON_MAYOR_MANIFESTO.PDF?SFVRSN=0)

Table Three: How important is public transport to your business?

	London	UK
Important	65%	36%
Unimportant	17%	30%

44 per cent of small business owners in London viewed public transport access as 'very important' to their business, compared to just 14 per cent of small business owners nationwide.

Small business owners with businesses in London raised different issues when asked to select three top issues affecting their use of the road network when compared to business owners in other parts of the country.

Table Four: What are the top issues in the road network affecting your business? (three selected from list)

	London	UK
Congestion on local roads	63%	45%
Parking availability	35%	22%
Congestion on motorways	30%	26%

Congestion and a lack of parking were therefore viewed as the two main issues affecting London based small businesses. These results are significantly different to the views expressed by small businesses based in other areas of the country, who were more likely to view potholes and frequent road works as the most significant issues.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- **How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

The successful delivery of Crossrail 2 represents the main priority for FSB in terms of improving London transport. Funding for this project should primarily come from the private sector. Where public financing is necessary in the form of Business Rates Supplements, we

would like thresholds, similar to those put in place for the Crossrail I project, in order to exempt the smallest businesses from paying a supplementary charge.

More generally, FSB believes that the ability to raise business rates to pay for infrastructure projects should be contingent on the support of the wider small business community. A similar process to the adopted within the Business Rates Supplements Act 2009 should be considered for infrastructure financing.

Freight on Rail response to Call for Evidence to National Infrastructure Commission:

This is the Freight on Rail response to the National Infrastructure Commission (NIC) call for evidence on the terms of reference listed.

Freight on Rail, a partnership of the rail freight industry, the transport trade unions and Campaign for Better Transport, works to promote the economic, social and environmental benefits of rail freight to local, devolved and central Government in the UK and to the European Commission, Parliament and Council of Ministers.

Summary

In addition to the terms of reference, covered in our sections A, B & C, we would like to make key general points, which are not only relevant to all three NIC terms of reference but also to the vast majority of NIC future infrastructure schemes.

NIC needs to take into account the socio-economic benefits of rail compared to HGVs which impose high external costs on society which are not internalised. Government policy, as a whole including the NIC, should set equitable transport policy across the modes which takes into account these market distortions. (See section 6)

Our response is comprised of key general points with headings below, explained in detail in sections 1-7 followed by our response to your terms of reference in sections AB & C.

The general points are covered under the following headings below:-

Growth of rail freight and its importance to UK PLC

Infrastructure Commission should make using rail a planning condition

Road and rail complement each other as part of the logistics solution

Rail's role in delivering to cities and transhipping to last mile low emissions deliveries

Land use planning

Lack of a level playing field between modes

Upgrading key rail routes can significantly reduce road congestion on key strategic corridors

1. The growth of rail freight and its importance to UK PLC

Both the Secretary of State for Transport, Patrick McLoughlin and the Rail Minister Claire Perry have voiced their support for rail freight. In June 2015 Claire Perry commented on *'the*

remarkable rise of rail freight' at the Rail Engineers Forum conference in June 2015. She highlighted rail freight's excellent record to date and its forecasted growth in two key market sectors saying that the Government wants to work with the rail freight industry to remove barriers that inhibit that growth.

On December 9th 2015, the Secretary of State endorsed her statement saying "*that the story of our modern rail industry is amazing and freight is a key part of that. We want rail freight to grow much further because demand to going to keep increasing*".

Consumer traffic has grown by 30% since 2006/7 and grew 5% in the last full year14/15.

Construction traffic increased by 17% in 2013/14 and 10% last year with 2.5 per annum growth forecasted. The decline of coal traffic has been largely anticipated and forecast although the scale of the decline was sharper than expected; coal traffic was down 61% in the first quarter of 2015/16. So the Government and devolved bodies need to work together with the industry to provide a network which can cater for more consumer rail traffic and construction traffic, both forecast to expand, to replace the coal traffic.

Industry Forecasts show intermodal rail traffic will quadruple by 2034

Consumer rail traffic is forecast to quadruple by 2034. Construction traffic 2.5% annum growth forecasted. But forecast are dependent on upgraded network and existing market conditions.

Retention of the mode shift benefit grants are important to overcome the lack of a level playing field between HGVs and rail. See section 6

2. **Infrastructure Commission should make using rail a planning condition** during construction phase of infrastructure projects for the delivery of raw materials and removal of spoil because of its lower external costs than road freight. The nearest railhead should be used whether building roads, rail, power stations or airports, using nearest railhead. The Olympics, Crossrail and Terminal 5 are good case studies of demonstrating the benefits of this approach.
3. **Road and rail complement each other as part of a logistics solution** by each playing to its strengths. As well as its bulk commodity markets, rail is well placed to offer the long-distance

trunk haulage for consumer traffic, as demonstrated its 30% growth since 2006/7 and its sustained 33% market share for the past few years, including in 2014/15.

4. Rail's role in delivering to cities and transhipping to last mile low emissions deliveries

A growing number of cities in the UK need to reduce air pollution to comply with EU regulations as seen by the Supreme Court ruling on London's air pollution violations. By 2020 Leeds will not be compliant with EU NOX regulations. Rail has far lower NOX emissions and lower particulates which are the key air quality problems. Two separate Colas Rail trials with TNT and Stobarts into Euston have proved that specialist freight trains can come into the heart of cities where the cargo can then be discharged into low emissions vehicles. Similarly, if rail connected consolidation centres are set up on the edge of conurbations rail can be part of the logistics solution by transporting the goods long-distance and then transhipped to low emissions vehicles for final urban deliveries.

5. Land use planning

We believe the NIC needs to be cognizant of the importance of land use spatial planning in delivering national infrastructure. Without coherent and integrated spatial and transport planning, the NIC, TfL and TfN will find it difficult to deliver the required rail upgrades. TfN can set the overall spatial planning framework for the North and direct local authorities to safeguard suitable sites and rail alignments for potential rail use in their Local Development Frameworks. For rail freight, it is crucial that local and regional authorities protect suitable sites for terminals for future potential use because there are a limited number of suitable locations which have the necessary rail and road connections. The Government's National Network National Planning Policy which includes the Strategic Rail Freight Interchange policy would support applications for SRFIs nationally significant infrastructure projects in the planning system.

6. Lack of a level playing field between modes

All levels of Government must take into account the scale of subsidy given to HGVs and the level

of external costs unpaid by the sector in their transport planning; HGVs impose almost ten times more external costs on the economy and society than rail freight. The latest research carried out for the Campaign for Better Transportⁱ using DfT values, found that HGVs pay less than a third of their costs, such as road congestion, road collisions, road damage and pollution which equate to an annual subsidy of around £6.5 billion. These conclusions are in line with a MDS Transmodal study in 2007 which found a very similar amount of underpayment: £6billion. The Government needs to recognise HGV costs in discussion about rail freight costs so that policy implications can then be understood in both directions with road and rail being examined across the piece. The level of HGV subsidy makes a compelling case for supporting rail, which imposes much lower costs on society and the economy, equivalently.

7. Upgrading key rail routes can significantly reduce road congestion on key strategic corridors

Research commissioned by CBT looked at specific routes which typically tend to be more congested because of more long-distance HGV traffic, particularly to ports. Its key findings were that:

- a) Some parts of road network have more long distance HGV traffic which could be carried by rail
- b) The impact of additional traffic in already congested conditions is far greater than a simple increase in pcu or vehicle kilometres suggest – it rises exponentially.
- c) In congested conditions each single per cent increase in traffic causes several percentage increase in congestion. In fact, Department for Transport figures state that a modest decrease in traffic of around 2%, results in congestion falling by 10%. DfT figures show that on congested parts of the network, congestion could be three to four times the percentage reduction in overall traffic levels, using a simple low congestion impact multiplier of 3-4.

The research found that in key corridors, such as the Trans- Pennine, London to East Midlands, Felixstowe to the North, Southampton to the North, Yorkshire and NE including M1 and A1, which all suffer severe congestion at peak hours the transfer of freight to rail could be significantly alleviate road congestion by removing HGVs.

<http://www.bettertransport.org.uk/sites/default/files/research-files/Freight%20mode%20switch%20report%20d6.pdf>

Importance and strength of rail freight as part of the logistics solution.

- Rail freight generates more than £1.6bn a year in economic benefits for UK PLC through improved productivity, reduced congestion and wider environmental benefits.
- Rail freight transports goods worth over £30bn a year, ranging from high end whiskies and luxury cars to supermarket products, cement and coal. Rail moves one in four of the containers entering the UK and half of the fuel used in electricity generation.
- The Hendy Review, which was tasked with reviewing the status of the Network Rail enhancement projects, acknowledged rail freight schemes deliver very high value for money. It stated that the average benefit cost ratio for rail freight schemes is between 4 to 5ⁱⁱ, which demonstrates that rail freight upgrades offer significant socio-economic benefits to the UK. Targeted infrastructure interventions work; the gauge enhancements out of the port of Southampton resulted in rail's market share increasing from 28 to 36% within a year of the completion of the work.
- **Terminals help regenerate local economies**
Local and regional authorities and LEPS therefore need to take into account the fact that rail freight terminals bring local re-generation benefits. Strategic rail freight interchanges (SRFI) can employ large numbers of staff directly. Daventry SRFI now employs around 5000 staff which will rise to 9000 when current expansion is finished. There is scope for terminals of all sizes which need new road/rail works.
For example, LEPS could help fund new roads to SRFIs and rail connections to the network for terminals through the Local Growth Funds.
- Rail freight industry has invested over £2bn since the mid 1990s

Rail freight's socio-economic benefits to society and the economy

- Rail freight is safer than road freight, HGVs are more than 6 times likely to be involved in fatal accidents than cars on local roads. *Source: Traffic statistics table TRA0104, Accident statistics Table RAS 30017, both DfT*
- Transfer to rail can reduce road maintenance costs as HGVs have an adverse impact on road infrastructure. The heavier HGVs are 160,000 times more damaging to roads than the average car- Source 4th Power law. This was shown by the high HGV charge for the M6 toll road, a private venture.
- Congestion benefits of rail freight - road congestion is now costing around £24 billion per annum according to the Freight Transport Association; the heaviest freight train can remove a 160 long distance HGVs from our roads – *Source Network Rail June 2010 Value of Freight.*
- UK rail freight produces 70% less Carbon dioxide emissions than the equivalent road journey- *Source DfT Logistics Perspective Dec 2008 P8 section 10*
- Energy efficiency of rail
A gallon of diesel will carry a tonne of freight 246 miles by rail as opposed to 88 miles by road – *Source Network Rail July 2010*
- Rail freight produces almost 90% less PM10 emissions than road freight and up to fifteen times less NOX emissions – *DfT Logistics Perspective Dec 2008 P8 paragraph 10*
- Damage and costs of main pollutants from transport
Road transport is the source of 80% of NOx in problem areas which rail can help reduceⁱⁱⁱ.

B.London's Transport Infrastructure

Protection of freight paths on the North London Line (NLL) and West London line (WLL)

These paths are vital to rail freight services irrespective of any extra capacity coming on stream out of the port of Felixstowe as they are needed for the following

- i) Two thirds of rail freight traffic has a London destination and that freight paths are not during rush hours.
- ii) The vast majority of London Gateway traffic will need to use the NLL.

iii) London Gospel Oak Barking electrification should include freight links to WCML and London Gateway.

There should be protection of potential and existing rail freight terminal sites beside railway lines with good road links for terminals of all sizes. As there is for riverside wharves which are protected through a GLA act. Rail sites should get the same protection as wharves. In the past, there was the SPG land for industry and transport.

Need both Strategic Rail Freight Interchanges for consumer products and more terminals for aggregates and other bulk products.

iv) Consolidation centres should be rail connected, as rail is well placed for long distance consumer traffic as well as traditional bulk commodities, to compete with road which would also have transshipment costs into smaller low emissions vehicles for example.

e) Channel Tunnel services into London were growing especially since the HS1 access to Barking Terminal and the reduction in CT charges but severely damaged by security issues at the CT.

C. Delivering future-proof energy infrastructure

Make using rail a planning condition for transportation, where practical, to reduce adverse impacts. Rail is currently used in the biomass and nuclear industry.

FTA Submission: National Infrastructure Commission call for evidence - London

January 2016

About FTA

The Freight Transport Association is one of the UK's largest trade associations and represents over 14,000 members relying on or providing the transport of freight both domestically and internationally, to or from the UK. Our members include hauliers, freight forwarders, rail and air freight operators, through to customers – producers, manufacturers, wholesalers and retailers. They cover all modes of transport – road, rail, air and sea. FTA members operate over 200,000 commercial goods vehicles on the roads in the UK; which is more than half of the UK fleet of goods vehicles. FTA members also consign around 90 per cent of goods moved by rail and around 70 per cent of goods moved by air and sea.

Introduction – UK infrastructure and logistics

FTA is pleased to be responding to this call for evidence. Infrastructure development in the UK has for too long been focused too much on the short term, stop start in its funding and has failed to adequately address national/regional needs in the face of local considerations. This has particular implications for freight as logistics is an inherently pan-national activity.

The efficient movement of goods is crucial to our society. Sometimes it is hard to remember the full scope of what is freight. At one end it is the heavy bulk movements like the construction material that makes our buildings and the waste that is taken away from our cities every day. At the other end, the book that is delivered to your house is also freight. Every cup of coffee you buy in a café is freight. Every piece of food on the shelves is freight. Every package of documents delivered to an office is freight. Every component or raw material used to supply a workshop is freight.

Without logistics society would grind to a halt overnight. In practical terms, everything that makes logistics less efficient adds to the cost of living and of doing business in the UK – everything that removes inefficiencies aids our development.

This is true of social objectives as it is of economic efficiency. More efficient logistics (through optimising mode used and ensuring free flowing movements) would help address emissions and safety issues – priority issues for FTA's members.

We look forward to working with the National Infrastructure Commission to help address the UK's needs as regards transport networks.

In the rest of this document, FTA will respond to the challenges identified and questions asked where they are relevant to our area of interest.

Response to Call for Evidence: London's transport infrastructure

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

London's population is expected to reach over 10 million people by 2030. This will increase demand for both personal travel for commuting and leisure purposes and also increase demand for deliveries and servicing activity. Due to the nature of the operations (ie final delivery to the customers' door) the vast majority of urban deliveries will always be made by road – therefore meeting the freight needs of the increased number of residents and increased economic activity in London will be a major challenge. Decisions will have to be made about the most efficient use of limited road space.

Transport for London estimates that central London congestion will grow by 60% by 2031. FTA believes that action needs to be taken now to secure the long-term sustainability of London if it is to maximise its competitiveness and attractiveness as a world city.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?
- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

Future investment in large-scale infrastructure improvements should not just be aimed at solving current pinch-points, but also unlocking new areas for development. All too often, the transport infrastructure to support new development is an afterthought, and the true economic potential is not realized due to poor connectivity. East London is the prime example of a growth area with poor transport links, particularly cross-river road connectivity. However, Transport for London is now seeking to redress this with plans for a network of new road river crossings in East London – these plans must be fulfilled

Investment in public transport and alternatives to driving, to remove the reliance on private cars, is key to reducing congestion - freeing up space for essential or efficient traffic such as freight, tradespeople, pedestrians, cyclists, and disabled drivers.

However, investment in the core, motor-traffic oriented, road network should not be excluded and it is important to consider how various schemes interact with one another. It is essential that we achieve a sensible balance between the needs of different transport users so that we make best use of limited road space to benefit London overall.

For the freight industry, journey times are important, but arguably what is even more important is journey time reliability. If journey times significantly increase or there is a poor level of certainty about journey times which could result in reduced productivity per shift, due to the constraints of EU drivers hours rules, we will see transport operators having to put more HGVs on the capital's roads leading to increased transport costs, congestion and emissions.

London needs increased road capacity in key areas – river crossing in east London being the first example, but across London improved roads will be needed. There are social impacts from increased road use – ie emissions and safety. FTA believes that in the timeframes we are talking about here these should be addressed through improved vehicle technology – not through restricting the improvement of infrastructure at key pinch points and congested areas.

If the logistics industry is to successfully serve the needs of London's increased population and consequently increased business activity, it will require a more efficient road network than currently exists. In the case of freight more infrastructure will not exponentially increase traffic as our industry only moves the quantity of goods that society requires of us.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?
- What innovative funding mechanisms could be considered to support delivery of key schemes?

All funding options should be considered. However, we need to be careful of private ownership of key infrastructure – the Severn Crossing on the M4 is a prime example of where such a move can lead to high user charges long after the capital costs have been recouped. FTA accepts that user charges may need to be introduced to both fund new infrastructure and to manage demand. However, any demand management measures implemented on new schemes should be focused on those who have alternatives (such as private car drivers) rather than essential delivery vehicles which have little alternative option but to use the capital's road network. This is to ensure that there is an appropriate deterrent effect on those who in the main have an alternative choice – to use public transport – and to avoid additional cost to essential deliveries and servicing activity which has limited modal shift opportunities in the capital.

Thank you for the opportunity to comment in the call for evidence:

<https://www.gov.uk/government/consultations/national-infrastructure-commission-call-for-evidence/national-infrastructure-commission-call-for-evidence>

We wish to make some points in relation to section 3 on London's transport infrastructure.

We include as Annex 1, and refer you to, our submission to the London Assembly Regeneration Committee inquiry into Transport-led regeneration.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Economic and social challenges which face London must be considered and dealt with together with environmental challenges, according to the principles of Sustainable Development which underpins planning and of a which a definition is set out in the NPPF, and also in the London Plan

<https://www.london.gov.uk/what-we-do/planning/london-plan/current-london-plan/london-plan-annexes> .

This means that solutions to London's economic, social and environmental challenges must be ones which are win, win, win for all 3 areas – as the government says “We want to achieve our goals of living within environmental limits and a just society, and we will do it by means of a sustainable economy, good governance, and sound science.” <https://www.gov.uk/government/publications/securing-the-future-delivering-uk-sustainable-development-strategy>

Indeed the key challenges facing London are ones which are economic, social and environmental in nature.

Population growth is a key challenge for London in all these 3 respects – including on transport implications. Anticipated population growth should be dealt with sustainably as part of a national strategic strategy, however some inevitable increases in London must be dealt with sustainably from a transport point of view. Population growth will result in potential extra journeys, and so pressure on existing infrastructure and demand for further investment.

Dealt with in the wrong way and this could have negative implications on the economy such as, if traffic was allowed to increase, through worsened congestion. There could also be negative social implications from more traffic including more accidents, worse community severance, and such as health impacts and worse health inequality from the environmental problem of worse air pollution (as the most disadvantaged tend to live near main roads where air pollution is worst worse air pollution exacerbates health inequalities).

However there is an existing problem and challenge of there being too much dirty traffic in London - current and expected worse congestion, and current inequalities including health inequalities are themselves key challenges for London.

Air pollution is an environmental challenge but also an economic and social one. Economically there are costs estimated at up to £20B a year, congestion and air pollution kept London down to 38th place for liveability in a ranking of world cities (<http://www.telegraph.co.uk/expat/expatnews/10648488/Viennas-the-most-liveable-city-but-polluted-London-misses-out.html>), and this would be expected to have impacts on the economy as businesses want an efficient as well as a healthy environment for people to live and work in and to visit. Socially nearly 10,000 Londoners die prematurely a year due to air pollution, with the most vulnerable in society being disproportionately affected – and with the early deaths being just the tip of the iceberg below which there is ill-health.

The NIC will be aware that the UK is failing EU legal limits for the toxic gas Nitrogen Dioxide (NO₂) which were due to be met by 2010, and 2015 at the very latest. It will also be aware that a Supreme Court ruling has meant that the government was required to produce new plans by the end of last year to meet limits now in the shortest time possible, but that these plans have been deemed by those who brought the case to be not adequate (failing as they do to take all possible measures).

The EU Air Quality Directive's requirements are absolute, and that there can be no averaging of improvements and deteriorations across a zone. Not only is there a non-deterioration principle to protect relatively good air under limits, and the requirement that a breach not be caused, but also that air over limits must not be worsened.

It is not adequate to rely for compliance with EU law on whether a scheme would delay compliance for the Zone ie if there would be elsewhere in the zone with worse air, as has been argued by some based on the NN NPS – but following that cannot render the UK in breach of its international obligations such as the EU Ambient Air Quality Directive. This issue was referred to in the McCracken opinion obtained by Clean Air in London:http://cleanair.london/legal/clean-air-in-london-obtains-qc-opinion-on-air-quality-law-including-atheathrow/attachment/cal-322-robert-mccracken-qc-opinion-for-cal_air-quality-directive-and-planning_signed-061015/.

The London Plan requires development to be Air Quality Neutral (as at 7.14c) ie for air pollution not to be worsened. However, given the requirement to meet limits in the shortest time possible AQ Neutral is no longer an adequate criteria at this time. Measures proposed to mitigate the effects of a scheme must be done anyway, but the scheme itself not allowed to add to the problem ie the scheme not pursued. Only then, with all other possible positive measures and avoidance of negative ones, would illegal air pollution be brought within limits in the shortest time possible.

There are particular air pollution challenges with the gap between emissions of NO_x expected due to lab tests not being matched in real world driving emissions. The EU Council of Ministers agreed on 28th October 2015 on standards for EU Real Driving Emissions (RDE). The agreement was reached in order to address the discrepancy in emissions between laboratory tests and NO_x emissions found in real world driving. However the new standards would allow new types of Euro 6 diesel cars to emit more than double the Euro 6 NO_x emissions limit from 2017 to 2020, and 50% more after 2020, thereby de facto increasing the standard of Euro 6 from 80mg/km to 120 mg/km (http://europa.eu/rapid/press-release_IP-15-5945_en.htm). There is also the challenge of the VW and wider scandal to be taken into account.

The need to address the causes of climate change are also a huge challenge for London's infrastructure – on transport (and on which measures to tackle air pollution largely overlap with those to tackle climate), and also in buildings and housing (particularly in retrofitting existing stock, and in new build), and on energy supply infrastructure.

Also the impacts of climate change are another environmental challenge which will lead to huge social and economic challenges too – for instance heatwaves and the need to cool the tube, drought and our water supplies, more intense rainfall and the need to slow water's progress into drains are all huge challenges for London's infrastructure. The Mayor and London Assembly have done considerable work on this.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

The only strategic options are those which deliver on sustainable development in London ie those which help not hinder our ability to live within our environmental limits, and to build a just society ie options which are win, win, win for the economy, society and the environment.

As well as ensuring what vehicles are on our roads are clean, traffic levels must be cut.

No schemes which would add to traffic can be pursued, and only schemes which give people alternatives and help them out of vehicles can be pursued – and this is all the more so the more population is expected to increase.

Road space can and must be restricted and can be re-allocated to help deliver a step change in cycling and walking infrastructure to maximise the potential for these modes, and for public transport to address identified need for longer journeys.

- **How should they be prioritised, taking account of their response to London’s strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**

The absolute priority is to progress only what will help deliver on environmental issues such as air pollution and climate change, as well as social issues including inequality, at the same time as developing our economy.

The first priority must be to plan to reduce the need for people to have to travel at all unnecessarily – by providing key amenities and work opportunities within easy walking and cycling distance of homes as much as possible. This is particularly important for any regeneration areas and where population or jobs are due to increase. This approach will help reduce pressure on existing infrastructure, and in turn the demand for further investment.

Facilities for safe and easy walking and cycling must be prioritised to maximise the potential for these modes, which are considerable – ahead of pursuing any identified need for new public transport to adequately enable longer journeys.

There is no place for adding to traffic levels – indeed all road users are helped by cutting traffic levels and less traffic helps congestion, resilience and journey times. Vehicle users are in fact helped by less traffic as this frees up existing roadspace for existing and some future new essential vehicle trips.

In East London a package of non-road measures including new non-road river crossings must be developed– the current road-building plans would add to traffic and so to congestion in the wider area (even if queuing at the existing Blackwall tunnel was reduced there would be worse congestion overall and at other places), and the plans would worsen air pollution.

Further infrastructure must not be allowed at City Airport – this is currently seeking a taxiway and new aircraft stands. City airport is a blight on East London with the aircraft noise, air pollution impacts, and the Public Safety Zone (PSZ) blights large areas around the runway itself. There would be multiple benefits from closing the airport (now that Crossrail will allow quick access to Heathrow) and freeing up the land for much needed housing and work and amenity uses

<http://www.neweconomics.org/blog/entry/why-its-time-to-close-london-city-airport>

- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Crossrail 2 (any more than Crossrail before it) must not be allowed to develop at the cost of other small scale local transport improvements.

Also, if these mega projects are being pursued, it is essential that the benefits of the investment are maximised by investing in complementary transport measures to feed people into and out of the mega scheme eg walking and cycling connections, and also other public transport, so that the benefit reach out to as wide an area as possible.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

London-wide road user charging or pay-as-you-go driving must be seriously looked at for London –the Congestion Charge Zone in central London has been very successful in keeping traffic out, and a scheme is needed to cover the whole of London in order to cut traffic and congestion (and help with air pollution), and this can be a revenue earner to be used to give alternatives to driving.

- **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

There are examples of how removing road space from vehicles has been done and been successful. For instance Seoul removed a key highway from its centre:

(<http://www.theguardian.com/environment/2006/nov/01/society.travelsenvironmentalimpact>)

Cities are now increasingly restricting road-space and traffic to tackle air pollution:

<http://www.theguardian.com/cities/2015/dec/09/car-free-city-oslo-helsinki-copenhagen>

(Oslo [revealed plans](#) to ban all private vehicles from the centre by 2019)

Re Inquiry: Transport-led regeneration

Thank you for the opportunity to comment on this important issue. We trust that, given that it was until the end of the month that responses to the inquiry were welcomed (see email chain below), you will accept our comments dated 31st August.

We wish to make the following brief comments, with reference to the Thames Gateway road bridge as a case study of ill-conceived transport-led regeneration.

We understand that Campaign for Better Transport will have made a submission referencing a report of theirs.

We wish to follow that up stating that it is our view that it is regeneration led by sustainable transport modes which is clearly the way to develop London sustainably in a way which helps address inequalities and helps us meet our environmental targets, and that road-building-led regeneration is not only counter-productive but also iniquitous.

Focusing on regeneration models which help improving accessibility through reducing the need for people to have to travel, by providing as much as possible, key amenities and work opportunities within easy walking and cycling distances not only enhances quality of life and health, but also takes the pressure off public transport.

Investing in public transport for any identified need to facilitate longer journeys helps all road users. It helps those without access to a vehicle and reliant on public transport, and also helps take the pressure off the road network – the aim should be that the road network should be left for essential vehicle journeys (both existing and potential new ones as a result of population growth).

By contrast investing in road-based regeneration tends to mean fewer people travel by sustainable modes (as people are attracted by driving), which is not only contrary to policy and also deprives people of the health benefits of active travel.

Non-road based regeneration makes much better use of space, enabling higher densities and more land available for housing and work opportunities, or public/open space – as providing space for roads and parking space is wasteful. The main businesses which tend to be attracted to an area when road-based regeneration is pursued would be vehicle-dependent development such as warehousing and distribution which tends to be low-density and low-employment usage.

Indeed, the evidence for road-based regeneration is very weak and potentially counter-productive.

The Greenwich Peninsula site should have been a prime development site, if its position next to the 4-lane

Blackwall road Tunnel was truly beneficial – yet the site lay dormant for a long time until British Gas paid English Partnerships £20m (as I recall) to secure a Jubilee Line Extension station on the site.

Further the proposed Thames Gateway road bridge (TGB) proposed between Greenwich and Newham, on proper scrutiny at a Public Inquiry in 2005-6, showed that the regeneration claims made for the scheme did not stand up.

Further, given the requirement in planning for sustainable development, whereby economic development, the building of a just society and the requirement to live within our environmental limits are required to be delivered together (ie through win, win, win solutions) it is clear that transport investment must be such that helps reduce inequalities (including health inequalities), and help deliver on environmental targets such as on climate change and air pollution – and that the pursuit of economic goals does not add to the problems of meeting either social and environmental goals.

Whereas non-road based regeneration helps deliver sustainable development, road-based regeneration adds to traffic levels (through generated traffic – whether overall or at certain times of day), and so worsens congestion in the area (though the pattern of existing congestion may change), and adds to air pollution.

More traffic and worse congestion and more air pollution blights and is clearly de-generation for local communities. Air pollution is an issue which hits the most vulnerable, and the most deprived the hardest (as they tend to live near the main roads where air pollution is worst) – and so adding to air pollution adds to health inequalities.

But worse traffic, congestion and air pollution is also bad for business and for regeneration – adding to congestion is clearly counter-productive, and air pollution makes an area unattractive for people to live or work or visit.

We wish to draw your attention to a few key links:

Case study: the Thames Gateway road bridge:

This press release and linked briefing refers to various issues raised by the planned TGB – on traffic generation and congestion, on air pollution, and on fewer people walking and cycling and using public transport if the scheme went ahead, and on regeneration.

Friends of the Earth's 2007 briefing from after the end of the TGB inquiry but before it was known the Inspector had recommended rejecting it

http://www.foe.co.uk/resource/press_releases/thames_gateway_road_bridge_06112008

Background briefing at the end of the Public Inquiry:

http://www.foe.co.uk/sites/default/files/downloads/thames_gateway_bridge_07.pdf

On traffic and congestion:

- Induced traffic: Professor Phil Goodwin

<http://stopcityairportmasterplan.tumblr.com/post/19513243412/induced-traffic-again-and-again-and-again>

- Transport expert John Elliott's slides showing when Blackwall tunnel was doubled from 2 to 4 lanes, traffic more than doubled within a year at peak time

<http://stopcityairportmasterplan.tumblr.com/post/20012814230/presentation-slides-arguing-the-case-against-the>

- John Elliott also has made clear that with more roadspace, more traffic would mean overall worse congestion in the area (though the pattern of congestion may change).

If congestion was relieved eg at the Blackwall tunnel/Silvertown Link approach then it would just mean that traffic had got on to another area quicker and making congestion worse there.

- The TGB Inspector's report stated that crossing was "likely to cause increased congestion"

http://www.foe.co.uk/resource/press_releases/thames_gateway_road_bridge_06112008

- A Hyder report which was buried by Greenwich warned of "The likely outcome would be the exhaustion of the Silvertown Link capacity within a relatively short timeframe with exacerbated congestion on the local road network." and "This could only be mitigated by a new high quality public transport link, such as a DLR extension."
<http://853blog.com/2014/05/06/buried-greenwich-council-report-criticises-silvertown-tunnel/>

Road building and air pollution:

- For example the TGB would have resulted in worse air pollution (see above)
- Kings college London did a study of widening the A206 (which was a key link to make a route all the way from the TGB to the M25 dual)

<http://www.sciencedirect.com/science/article/pii/S0048969714010900>

This showed:

- Local air quality deteriorated after completion of a road widening scheme in south London.
- The EU PM10 limit value (LV) was breached during construction.
- NO2 LV was breached after scheme due to increased cars, taxis and LGVs

Despite this evidence, TfL have continued to pursue new road-building and argued that it would help regeneration.

What they have not done is look at a proper package of non-road alternatives, which would include multiple non-road investments as well as road-pricing etc as required.

GB Railfreight – Response to the National Infrastructure Commission

London Transport Infrastructure Review

Q. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Rail freight plays a vital role in bringing aggregates and other construction materials to London for major civil engineering and construction projects, as well as removing waste in the form of spoil. For Crossrail, GB Railfreight has transported over 1 million tonnes of excavated material from the tunnels to a new nature reserve at Wallasea Island in Essex.

In order to sustain growth across these markets, and continue supporting UK manufacturing and construction, it is vital that London possesses strategically effective rail connectivity and freight facilities. As such, we are going to detail areas that we believe need to be considered in the National Infrastructure Commission's Review.

a. Inland rail freight terminals

i. Aggregates terminals

In the Greater London Authority's Local Aggregate Assessment for London 2013, it was concluded that, with two years left to run on the Capital's landbank of permitted aggregate reserves, rail heads would be crucial in sustaining high levels of imports into London.

GB Railfreight supports the development of existing and new strategically effective aggregates terminals across London, which are truly open access for the rail freight industry, in order to deal with actual and prospective growing demand.

The key to adjusting to demand and not wasting spend on the wrong developments is focusing on sites that have economies to support them, as well as incorporating aggregates needs in plans for station rebuilds and enhancements (e.g. Euston station), and major programmes such as HS2.

Despite being intermodal terminals, both Stratford and Willesden freight terminals are prime examples of speculative builds subsequently closed, that suffered significant losses because, along with delay risks and road congestion costs, they had a limited market to drive business.

On the other hand, if we assess Hanson UK's Kings Cross Concrete facility, it has been able to grow into the second largest concrete site in the UK as a result of its strategic location. This growth has been supported by infrastructure at the facility, which allows it to accept large trains and offer significant storage space, as well as high levels of operational competitiveness.

It is also important to note that central and local government's commitment to selling off public land reduces scope for potential aggregates sites in London and, as a result, the Chancellor's 160,000 homes target.

GB Railfreight recommends that an evaluation is made of the markets across the Capital that require support, or further support, from an aggregates rail freight terminal.

ii. Cricklewood

Cricklewood represents the last location in London that is ideally connected for both road and rail freight. Companies operating there primarily carry out spoil and refuse haulage. In September last year, GBRf ran its first train for FCC Environment, transporting waste from its new North London Railfreight Terminal in Cricklewood to Buckinghamshire.

As the Capital continues to build, and major projects and programmes such as Crossrail and HS2 progress, more and more construction soils and materials need to be able to leave the capital efficiently and with the least cost to the environment. This comes at a time when London's roads are already seriously under strain. Cricklewood will, therefore, be crucial in helping remove lorries from London's roads.

The planned Brent Cross Thameslink railway station, as part of the Brent Cross Cricklewood development, will see various freight sites being moved from one side of the Midland Main Line to the other. Our concern is that could lead to the reduction in available land for freight, so we would like to see various sites safeguarded for freight prior to the move.

GB Railfreight recommends that freight sites at Cricklewood are safeguarded.
--

b. Freight route investment

In order to support proposals around inland freight terminals and freight capacity in London, we need to address the problems of bottlenecks on key lines in and out of the Capital. These bottlenecks often occur on sections of two-track with flat junctions, such as on the North London Line, West London Line and South London Line.

The North London Line provides a nationally important and electrified freight route from the UK's largest ports, at Felixstowe and London Gateway. In order to cater for the planned growth of freight and passengers, and to do so robustly over the next 20-25 years, the North London Line needs additional signalling throughout and a new regulating point near Gospel Oak or Kensal Rise. Reduced planning headways (with additional signalling) are also needed between Gospel Oak and Barking.

Further capacity problems exist on the Midland Main Line north of St Pancras, which has been designated as congested infrastructure by Network Rail. The Line cannot cater for current demand, let alone future passenger and freight growth. As such, timetabling is crucial to limit delay. However, with the second stage of Thameslink opening in 2019, this will become even more difficult.

The investments made by the Strategic Freight Network fund, and work carried out by Network Rail to incentivise passenger growth, have increased the separation of freight and passenger services. Following West Anglia Route Modernisation and enhancements to the Great Northern Great Eastern line, there will be the potential to run freight and passenger operations from London to Doncaster in almost total separation. More opportunities to separate the traffics brings benefits to both modes of freight and passenger, whilst crucially retaining the ability to use both routes for contingency and maintenance provision.

GB Railfreight recommends that opportunities are evaluated for improving infrastructure capacity on the North London Line, South London Line and Midland Main Line.

National Infrastructure Commission
Response the call for evidence on London
Gravesham Borough Council Response

Introduction

Gravesham Borough is located in Kent south of the river Thames, east of the Dartford Crossing and has a population of 105,300. The main Gravesend/Northfleet urban area has a population of 84,400. The rest of the Borough is covered by Green Belt, though within that there are significant areas of Ramsar/Special Protection Area (North Kent Marshes) and parts of the North Downs Area of Outstanding Natural Beauty.

On the west side of the Borough north of the A2 is the Ebbsfleet Valley, shared with Dartford Borough Council, and now covered by the Ebbsfleet Development Corporation. The two Boroughs' remain the plan making authorities. Considerable development has been proposed and consented in the Ebbsfleet area, and is now starting to happen on the ground. The EDC is charged with accelerating and developing the vision for the 'Garden City'.

The Borough is crossed west-east by the A2 trunk road (4 lanes plus hard shoulders) connecting London and the M25 with North Kent and Dover. The M20, just to the south of the Borough, is the main route to the Channel Tunnel and ferry's. Both connect to the M25 which provides links round London and to the rest of the country.

There are three railway lines across the Borough, all running roughly east - west. The North Kent Line links London Charing Cross & Cannon Street with Medway Towns via Dartford & Gravesend. HS1 links London St Pancras with the Channel Tunnel with an international and domestic station in the Ebbsfleet. Domestic Services operate over HS1 from East Kent via Ashford and via Gravesend. Finally there is the Chatham line running through the rural area linking London Victoria with the Medway Towns and East Kent (east of Medway this is confusingly also referred to as the North Kent line). Travel times currently to central London are in the order of 60 minutes from Gravesend by the traditional routes and 24 minutes on HS1.

27% of the working population are employed in Greater London and commute by coach, rail & drive, and only 33% work within the Borough. 18% of journeys to work are by public transport and 65% are by car.

The Borough therefore qualifies as part of the 'London commuter hinterland' and there is a tension between a role (at one extreme) of being a pure commuter settlement and providing more employment in the Borough to produce more sustainable travel patterns.

The north of the Borough is part of Thames Gateway with significant redevelopment opportunities on former industrial land. Land values, compared with London, are relatively low so there are viability issues.

Question 1 Economic and Social challenges

Gravesham has an adopted Local Plan Core Strategy to 2028¹. Work for Kent County Council extrapolates this to 2031². The Council has commissioned technical work for the Local Plan including a SHENA (Strategic Housing and Economic Needs Assessment) which will update the objectively assessed housing need, employment and retail requirements and

¹ Gravesham Local Plan Core Strategy <http://www.gravesham.gov.uk/services/environment-and-planning/planning/planning-policy/gravesham-local-plan-core-strategy>

² KCC Infrastructure plan <http://www.kent.gov.uk/about-the-council/strategies-and-policies/environment-waste-and-planning-policies/growth-and-infrastructure-framework-gif>

look further into the future. This includes analysis of development land values and site viability. This study will be subject to consultation in the spring, but is likely to show, in line with the national household projections, higher levels of housing need. As a rule of thumb the latest national household projections suggest something in the order of a 25% increase in annual housing completions for Kent as a whole over and above levels set out in the South East Plan (as an arbitrary benchmark). This represents a major transport challenge for an already stretched transport infrastructure across the South East.

The Borough has a finite supply of brownfield sites, and once these are developed it will be necessary to hold discussions within the sub-region about the scale and location of development. This will include the role of the Metropolitan Green Belt and its boundaries. As noted above there are nature conservation and landscape constraints in the rural area. The Borough is the least self-contained in employment terms in Kent and there is an objective to increase local employment for sustainability reasons.

A major component of new development is in the Ebbsfleet area around the International and Domestic Station, shared with Dartford Borough. The overall strategy stems from the mid 1990's and the arrival of HS1, and required a significant modal shift. Planning permissions exist for the most of the overall area. The Ebbsfleet Development Corporation (EDC)³ is now taking this area forward and has commissioned a masterplan. It has £310 m to assist with infrastructure delivery over the next 5 years.

London Resort Company Holdings (LRCH) is proposing a leisure resort on Swanscombe Peninsula mainly in Dartford Borough, which is aimed at attracting 15m visitor a year and directly employing some 13,000.⁴ LRCH are continuing to develop their proposals and assess the impacts, but they are of major significance in creating demand for travel by both workers (13,000 jobs directly) and visitors (up to 96,000 per day at peak). It is currently intended to progress the development via an application under the NSIP process.

The EDC masterplan will deal with both a 'with and without' London Paramount world. Various sites have recently been granted Enterprise Zone status in the Ebbsfleet and at Northfleet Embankment. The new development needs to be grafted and integrated with the existing communities, complicated physically by the changes in levels brought about by the chalk quarrying of the past.

It has been known since the original work on Kent Thameside in the mid 1990's that given the local road infrastructure (and reasonable enhancements thereto) that a major shift to public transport was required to cope with travel demand along with additional local jobs. The HS1 station at Ebbsfleet was a key part of the strategy along with the Fastrack system. The later along with local bus routes, walking and cycling networks is the foundation on which rail sits.

The intention was to create a substantial amount of local employment to attract employees, especially from further east, and increase local self-containment. In Gravesham the housing market already includes a component of movement out of London and on further east, so commuting will remain a significant element.

A2 is highly congested and proposals are being developed junction enhancements to support development at Bean and Ebbsfleet. Proposals exist for additional crossing capacity either at the existing Dartford Crossing or east of Gravesend. A fresh consultation is about to occur on this contentious issue. The Borough Council opposes routes east of Gravesend on environmental grounds.

Both residents and businesses see transport as a key issue, as witnessed by reposes to recent consultations by EDC and LRCH. There is scepticism over the ability of the transport

³ Ebbsfleet Development Corporation <http://www.ebbsfleetdc.org.uk/masterplanning/>

⁴ LRCH <http://www.londonparamount.info/have-your-say/project-documents/>

system to handle new development and concern over the reliability of the system, especially by business.

Thus there are major transport issues locally, never mind the outworking of some of the considerations outlined for example in the London Infrastructure Plan 2050⁵.

It is important that a focus on major infrastructure projects does not exclude considerations of ease of use – covering such matters as information, paying tolls and fares. Progress is being made, slowly, on integrated ticketing for public transport but a similar approach is needed elsewhere. For example will it be possible to have one account to handle all Thames tolled river crossings?

The bus networks should not be overlooked – as there is a fundamental disjunction between method of organising bus services inside and outside London. In the former it is essentially specified by TfL whereas outside it is based on competition – which had de facto produced local monopolies. TfL services reach as far as Bluewater.

There is therefore a major challenge from growth to handle the demand for movement across the South East.

Q2 Strategic Options

The answer to this question has been addressed by mode to illustrate the complexity of the issues. The fundamental point is that this is a regional issue (meaning the wider Southeast), especially in relation to the rail network, not just a London one. There is finite rail capacity which is trying to meet the growing needs of passengers, both inside and outside London. The same is true of the strategic highway network which at peak times, and in some locations all day, highly congested. There is a big question, especially outside London, where on the Commissions timescale substantial new development is going to occur.

There is a tension between what might be called a London view of the world – seeing the inner South East as a source of housing for jobs in London – and a view seeking more local jobs and meeting local housing needs. In the local context this is exemplified by the counter weight that London Paramount would offer in terms of jobs.

The Commission is not in a position to determine future development patterns: it can only work on existing commitments and some future options. Major development outside London logically requires routes that support it which will suggest which corridors should benefit from, for example, Crossrail 2 or Crossrail 1 extensions but also possibly links that do not focus on London.

In arriving at changes to the network there is a danger in trying to fit a scheme to services, rather than specifying what services are needed (as a consequence of the future demand or existing congestion) and then providing the infrastructure that serves that. Many of the quick wins have been already made and future will require more Crossrail like schemes (e.g. Crossrail 3 from South East London) on the basis that terminal platform capacity is hard to expand.

Q2 Strategic Options: Road network

The A2 past Gravesend was widened in 2008 to 4 lanes, and moved slightly south. At peak times it is running at over capacity and a number of the junctions have started to show stress. The A2 is an important part of the local road network as well as its strategic role, for example past the Ebbsfleet only it and A226 (single carriageway road on a chalk spine) provide east – west links.

⁵ London 2050 <https://www.london.gov.uk/what-we-do/business-and-economy/better-infrastructure/london-infrastructure-plan-2050>

The current Dartford Crossing is severely congested and the Government has accepted the need for additional crossing capacity. A consultation is imminent on the options that have been recently refined either at the existing crossing (corridor A) or east of Gravesend (corridor C). Gravesham opposes corridor C because of the environmental impact. The debate about route choice will take place elsewhere but the need for additional crossing capacity (along with proposals inside London) is obvious. Once a route corridor is selected delivery of this scheme should occur within the current timeframe of 2025.

Highways England is committed to enhancing the A2 junctions at Bean and Ebbsfleet junctions to deal with existing problems (Bluewater) and development. London Paramount is working on a junction enhancement at Ebbsfleet to serve both their proposal and the already consented development. Various developments are committed to contributing to such schemes. This however ignores the cumulative implications on other junctions of development across the Gravesend/Northfleet urban area. Tollgate junction (A227) is already stressed. Lower Thames Crossing will make a difference depending on the option chosen, and it is not currently clear what the net effects will be.

The role of Fastrack has already been mentioned but both it and local bus services need to offer frequent, fast and reliable services. Depending on local circumstances this may involve dedicated routes, bus lanes on existing roads and measure likes priority at traffic signals.

On the highway network there is a tension between long distance strategic flows (cross channel traffic for example) and local commute. Highways England is charged with improving the strategic network and Transport Authorities (Kent CC in this case but Medway is also relevant) the local. Private developers are expected to fund improvements for their developments, for example London Paramount as noted above is looking to build a new access road and improve the Ebbsfleet junction.

Local Planning Authorities are trying to meet their housing and employment needs in a context where there is no overview of what the region, including London, needs to meet or the national transport infrastructure needed to support it. There must come a point when the transport infrastructure cannot handle additional development where the relationship between homes and jobs is critical.

Q2 Rail network

Rail network has already been described above. 12 car schemes and power supply enhancements have or are being implemented – the current short term need is for Southeastern or successor(s) to have sufficient rolling stock to run more 12 car trains. There is a particular need for additional high speed rolling stock as peak hour trains are regularly full and standing from/to Gravesend.

Safeguarding exists for Crossrail 1 to be extended out to Gravesend (passenger services) and to Hoo junction for stabling sidings. A study is currently underway looking at the case for extension and what infrastructure would be needed. This is related to the levels of development in Kent Thameside and proposals currently being explored along the riverside in the London Borough of Bexley.

A further complication is the “with and without” London Paramount cases. The later would certainly significantly enhance the need for services east and west from Swanscombe/ Northfleet to get labour to/from the development. The Borough Council would support the extension of Crossrail to help meet the need for additional capacity on the North Kent line, given the constraints further into London. There is an obvious logic in diverting as many passengers as possible (for whom it is an appropriate route choice) onto HS1 from Ebbsfleet, Gravesend and Medway. Crossrail could then do the same at Abbey Wood leaving the rest of the traffic on the traditional lines where expanded services provision should be possible. What is required needs to be explored further.

Transport for London and others have expressed a desire (with or without taking over the franchising role and making it a concession) for regular interval services on the various routes from Dartford into London. The precise nature of these proposals is unclear both in terms of service pattern, termini, infrastructure and rolling stock implications etc. The point of all this is to illustrate that the issue is not a simple one of infrastructure and requires the balancing of a number of factors. On rail issues at least there overall balance needs to be looked at in the context of transport for the south east – not just London.

Q2 River

Currently Gravesend is linked to Tilbury by a regular ferry service, subsidised by Kent County Council and Thurrock Council. The Borough Council has invested in a pontoon off the historic Town Pier to increase the potential usage. London Paramount has discussed services from central London to serve their development (and use of the river in the construction phase) and also provide access for labour from Thurrock. The potential of the Thames should not be overlooked as a transport corridor for both passengers and freight, where for example London Paramount has identified considerable scope in the construction phase.

Q3 Crossrail 2

No direct comment on this scheme other to note the on-going tension between an all stations inner suburban service and aspirations for it to serve destinations further away which implies a different sort of rolling stock and a lack of segregation, as illustrated by Thameslink.

Q4 Funding

Any schemes for new infrastructure will require funding and the Commission will no doubt be presented with a list of projects with a combined large price tag. Traditionally major strategic schemes, whatever the mode, have been funded by Government, whether directly or indirectly. The private sector has played a role (e.g. Dartford Crossing) where tolls can be collected and a funding model constructed. The Local Government funding model is in a period of austerity and it cannot be assumed to produce any greater financial input than hitherto.

Developers are often seen as a source of funding. Major schemes certainly require major transport investment – but this is likely to be for local transport requirements and not able to meet major strategic needs on a significant scale. The Crossrail/Lower Thames Crossing type schemes with costs in the billions will still require significant subsidy. Land values in the Gravesham urban area are only able to support local transport and social facilities to make the area function. The GLA CIL approach to Crossrail funding would for that reason be unlikely to produce significant income on current land market values.

Q5 Lessons for London

This question is interpreted as applying to London and its 'commuter hinterland'. The key points are:

- Transport is a South East issue not just a London one
- There needs to be a strategic regional view
- There are major issues with capacity across a number of modes

- Need to define the 'services' needed (what that means varies by mode) to meet the demand and then define projects that produce the required outputs
- Whatever happens the resulting plan will be a compromise between a host of factors
- There needs to be cognisance of how the system operates as whole (so ticketing, paying tolls etc. is part of the whole from the user perspective)
- Obvious anomalies (e.g. TfL rail concession model versus franchising, differences in the operation of bus networks) in legal framework across boundaries that hinder integration
- Gravesham is particularly interested in:
 - Lower Thames Crossing
 - A2 junctions
 - Full use of existing rail infrastructure
 - Extension of Crossrail 1
 - Development of interchange, bus, walking, and ticketing initiatives to make the overall system work
- Development in lower value areas won't pay for the big ticket items because of scale of costs involved

8 December 2016

MAYOR OF LONDON

Lord Adonis

Interim Chair
National Infrastructure Commission (NIC)
1 Horse Guards Road
London SW1A 2HQ

Date: 15 JAN 2016

Dear Andrew

Response to the NIC's call for evidence

Please find enclosed the Greater London Authority's (GLA's) and Transport for London's (TfL's) joint response to your call for evidence on large-scale transport infrastructure improvements in London. I also comment in Appendix 1 on your study on improving the balance between electricity demand and supply and in Appendix 2 on London's wider infrastructure requirements, which I hope will provide some context and stimulus for the Commission's future work.

Context

Investment in infrastructure is more vital than ever to sustain London's projected economic and population growth, given that the city recently surpassed its previous population peak of 8.6 million set in 1939.

The capital's economy is vital for the rest of the country and is an extraordinary national asset - one of only a handful of truly global cities on the planet. In preparation for this new era of growth, in 2014 I consulted widely on an infrastructure plan for the capital, setting out where growth is likely to come, the long term infrastructure requirements for the capital to 2050, how much they might cost, how we might pay for them, how the plan can adapt to technological change, and how infrastructure delivery should be better coordinated. Appendix 2 provides more background.

Crossrail 2 – the right scheme for London

With regard to new large scale transport infrastructure, my top priority and my first request for government funding is Crossrail 2. I am delighted that the NIC as an independent body can look afresh at this scheme. I am convinced that once the detailed analysis that already exists on this and other potential options is examined, the Commissioners will confirm their support for it.

It is the right scheme for London and the South East because of its unique combination of benefits, amongst which it will simultaneously:

- relieve a series of transport bottlenecks that exist on a network upon which central London's economy depends;
- provide new connections between areas of significant housing potential across the south east and London's main employment centres, thus boosting housing supply to support employment growth;
- support some of the most deprived parts of London.

MAYOR OF LONDON

Critically, it has overwhelming public support, which also means that it can be implemented with relatively little controversy or opposition. It has for many years had its route safeguarded; all other potential schemes would require years of development to get them to an equivalent stage. As part of its development, many alternatives have been considered, including enhancements to the existing rail network and smaller rail schemes. It is clear that no feasible alternative schemes, either individually or cumulatively, could generate the combination of capacity and connectivity benefits that together offer the transformative impact on economic performance that Crossrail 2 is expected to bring about.

Consequently, Crossrail 2 is my considered priority and that of TfL's Board. As you know, it also commands the support of London's business community.

I am now ready to proceed to the next stage of this project's development for which I need the Government's full support. We cannot relive the experience of Crossrail 1, which was conceived in the 1940s, took shape in the 1970s and 1980s, was (unjustly) rejected by Parliament in the 1990s, resurrected by my predecessor and me in the 2000s and will at last open in 2019, nearly 80 years after being first mooted. I am sure that you will want to help us all do far better for Crossrail 2. It is important that we do not keep going back to square one when there is a viable and popular scheme on the table. I have a brilliant team in place to deliver it. To put it another way, from now on, every six months delay by the Government will result in up to £4b in lost benefit including thousands of homes that could be built at or near a Crossrail 2 station.

Funding

There is no doubt that Crossrail 2 will be expensive, but I believe it is eminently affordable. During construction, its costs will be a small fraction of the regional economy that it will serve for decades, if not centuries, to come. We estimate it could deliver an economic boost of up to £7.9b per annum. Its construction will create 60,000 jobs and it will provide opportunities throughout the national supply chain, as has been the case for other major projects in London, including Crossrail 1 and the preparation for the Olympic Games.

Crossrail 2 should be funded ultimately by those who will benefit from it most, including those whose property values will increase as a result of the decision to build. We have time to develop a set of policies to capture a proportion of this value uplift to pay for the scheme, but we need to make good progress soon. I would also expect contributions from those outside the capital who will benefit from it.

Insofar as we remain a highly centralised state, fiscally, then we will continue to rely on government grant to fund it. Economically that would be rational given Crossrail 2's boost to a regional economy whose taxes go largely to the national exchequer. However, I have argued consistently for the devolution of fiscal powers to enable us to pay for much more of it (and other schemes) ourselves. Such powers could include a variety of taxes and similar instruments highlighted in the submission. The political acceptability and economic appropriateness of these can and should be assessed in more detail during the development phase. What is not acceptable is neither grant nor the powers to pay for the scheme ourselves, if the strength of the rest of the business case is accepted.

MAYOR OF LONDON

Development funding

I am asking the NIC to recommend that the Government take the necessary steps to enable a Hybrid Bill to be submitted before the end of this Parliament. This requires an application for statutory powers in the coming years which would allow the delivery phase to commence in 2020 and the scheme to open by 2030. The sponsorship and consent costs associated with this are £250m and we are seeking the NIC's support for funding from the Transport Development Fund for a significant proportion of this. If insufficient funding is made available for these activities there is a risk of setting the project back by at least half a decade, which could constrain London's growth.

Key considerations for determining the appropriate allocation of national resources for major new 'national' infrastructure are set out below. These are intended to assist the NIC in making its recommendations to the Government on prioritising national resources for large scale transport infrastructure - and more immediately those required for planning and developing them:

- the scope for unlocking genuine economic potential through intensifying or transforming the way land is used, as expressed through economic performance measures such as GVA, and the extent to which this is additional at the national level;
- the key constraints that prevent people and places from realising their economic potential, including both transport bottlenecks and shortages of housing;
- the wider impacts including the sustainability implications of alternative strategic choices;
- the 'economic payback' of large scale infrastructure investment and the implications for national level funding through the impacts on fiscal receipts associated with the economic performance benefits;
- the opportunities for regional and local funding from development that is unlocked and other sources;
- the pressing nature of the strategic challenges and the timescale for addressing them, in particular the threats to continued growth arising from constrained transport capacity and inadequate connectivity as population pressure increases.

Conclusion

Overall I believe that once Crossrail 2's benefits are viewed holistically, its top ranking priority becomes clear. It will underpin new urban areas, support our nationally critical employment centres, boost the supply of homes, provide a large number of jobs, support a national supply chain, deal with major transport bottlenecks, give a lift to areas of national disadvantage, and reinforce a transport network that underpins the country's most productive region. It thus already commands widespread support. It is now time to get behind it with proper funding so we can build it in the 2020s.

I am confident that your Commission will support Crossrail 2. My team and I look forward to our continuing discussions and we will try to supply whatever further detail you may require.

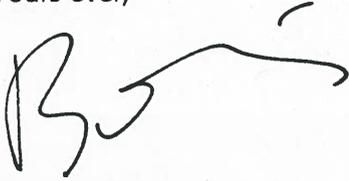

Other projects

For the avoidance of doubt, my only call on the NIC's Transport Development Fund is for Crossrail 2. More broadly, I also support a submission by the Chair of the West Anglia Taskforce on 4-tracking of the West Anglia Main Line, setting out its potential as a prerequisite to, and to bring forward the benefits of, Crossrail 2 (as set out in paragraph 32 in this submission); and a separate submission being made by a number of parties including the London Borough of Bexley on the

MAYOR OF LONDON

case for extending Crossrail 1 eastwards, which could enable substantial growth in the south eastern corridor from London towards Ebbsfleet and Gravesend. These and other schemes, such as the Bakerloo line extension and A13 Riverside tunnel that we are developing, are important parts of the necessary pipeline of transport investment described in paragraphs 34-40 of the submission, but for which we are not seeking funding (at least at this stage) from the Transport Development Fund.

Yours ever,

A handwritten signature in black ink, appearing to read 'Boris', with a long horizontal flourish extending to the right.

Boris Johnson
Mayor of London

Encs.

LONDON'S LARGE SCALE TRANSPORT INFRASTRUCTURE REQUIREMENTS

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?	Page 19

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

1. Since the advent of the modern Mayorality in 2000, London has benefitted from its ability to undertake integrated strategic planning. There is a suite of statutory and non statutory documents that draw on a common evidence base developed and tested by the GLA and its functional bodies (including TfL):
 - The London Plan¹ and Mayor's Transport Strategy (MTS)² in particular set out a clear strategic policy framework for planning London's growth over the next 20 years.
 - In 2014, the Mayor also published a London Infrastructure Plan for 2050 that looked beyond this horizon.³ This reflects some of the emerging challenges that have become clearer since the publication of the MTS in 2010, including stronger population and employment growth than previously anticipated and the scale of London's housing supply shortage, which were described in the Crossrail 2 Strategic Outline Business Case (SOBC). These are expected to be addressed in an updated MTS following the 2016 Mayoral election, in the context of the new Mayor's overall priorities.

Summary of key challenges

There will continue to be a critical national role for London in driving sustainable economic growth

2. The UK will be competing in an ever more globalised world in which large cities will play an increasingly important role as the economic dynamos⁴. London is at the heart of a network of world cities that have led this process and the UK benefits greatly from hosting one of these global centres. An important economic challenge facing London over the next few decades is to maintain and extend this role.
3. London hosts a major cluster of globally competitive sectors in and around its centre which benefit from large economies of agglomeration⁵ and this represents a source of UK comparative advantage in the world economy. The relationship between employment density and productivity in the 100 largest employment centres is illustrated in Figure 1. The evidence for economic mass and productivity effects is set out in the DfT's Transport Investment and Economic Performance report⁶.
4. Ready access to a very large population catchment as illustrated in Figure 2, is fundamental to London's ability to act as a global employment centre. This depends critically on the transport

¹ <https://www.london.gov.uk/what-we-do/planning/london-plan/current-london-plan>

² <https://www.london.gov.uk/what-we-do/transport/our-vision-transport/mayors-transport-strategy>

³ The Transport Supporting Paper in particular considered London's economic and social challenges:

https://www.london.gov.uk/sites/default/files/Transport%20Supporting%20Paper_3.pdf

⁴ McKinsey (June 2012), Urban world: cities and the rise of the consuming class

⁵ A number of locations make up London's global employment core (the West End, City, Isle of Dogs; Stratford is emerging as a further centre and may be joined by Old Oak Common). All are dependent on a shared set of network benefits generated by the radial transport system focussed on central London.

⁶ https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/386126/TIEP_Report.pdf.

See Chapter 3, pp30 – 41.

network serving London and the wider south east⁷, which remains one of the densest and most comprehensive in the world, and which consequently represents a national asset of immense value.

Figure 1: The relationship between employment density and productivity in the 100 largest employment centres

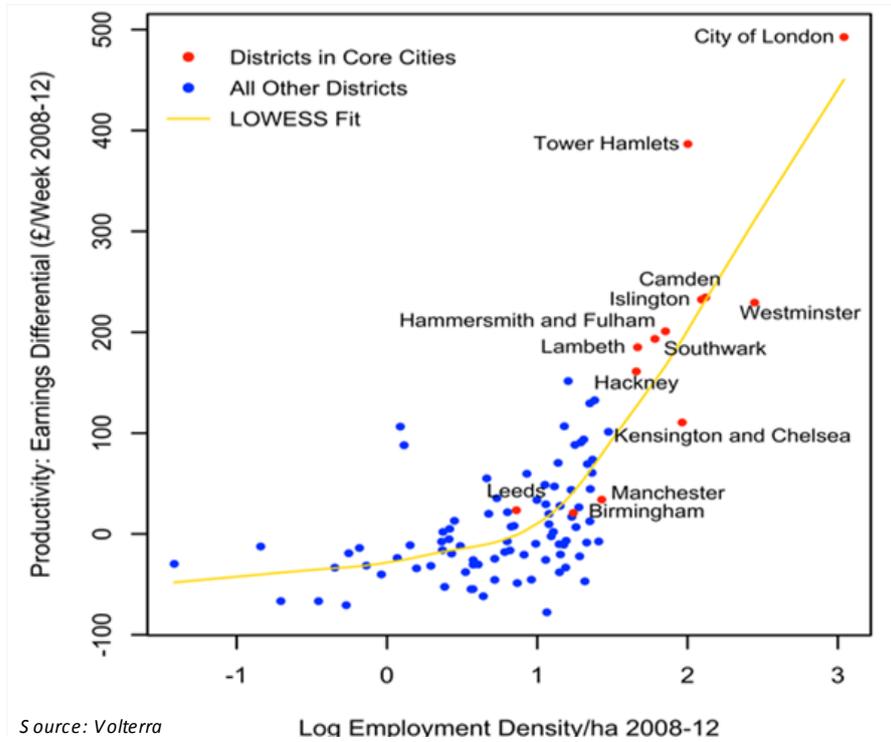

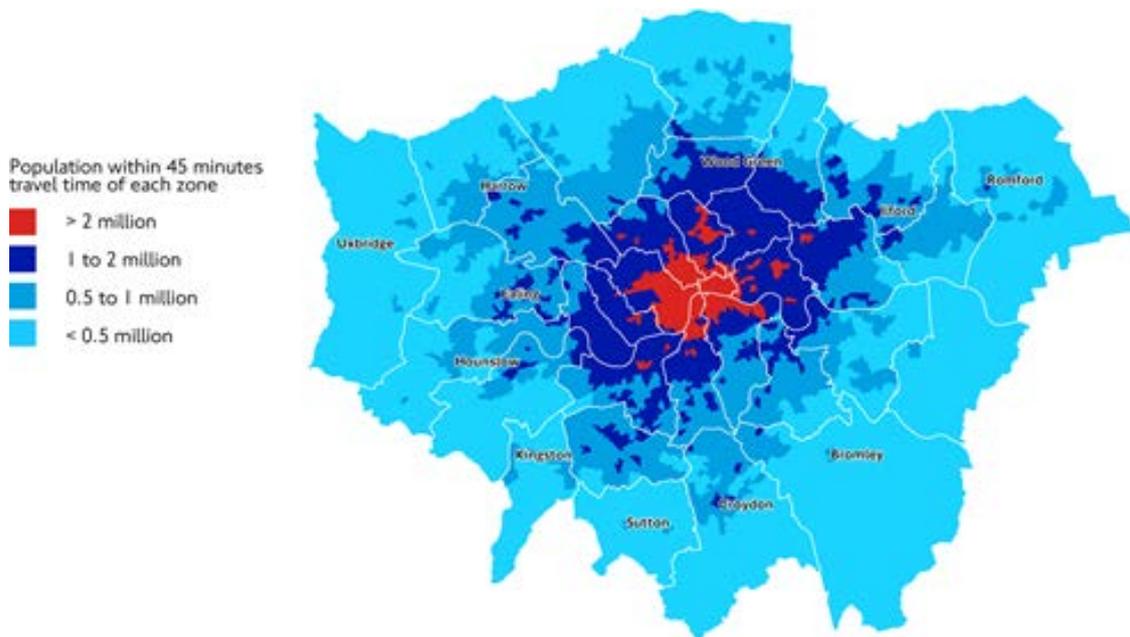

Figure 2: Accessibility: total population within 45 minutes' travel time

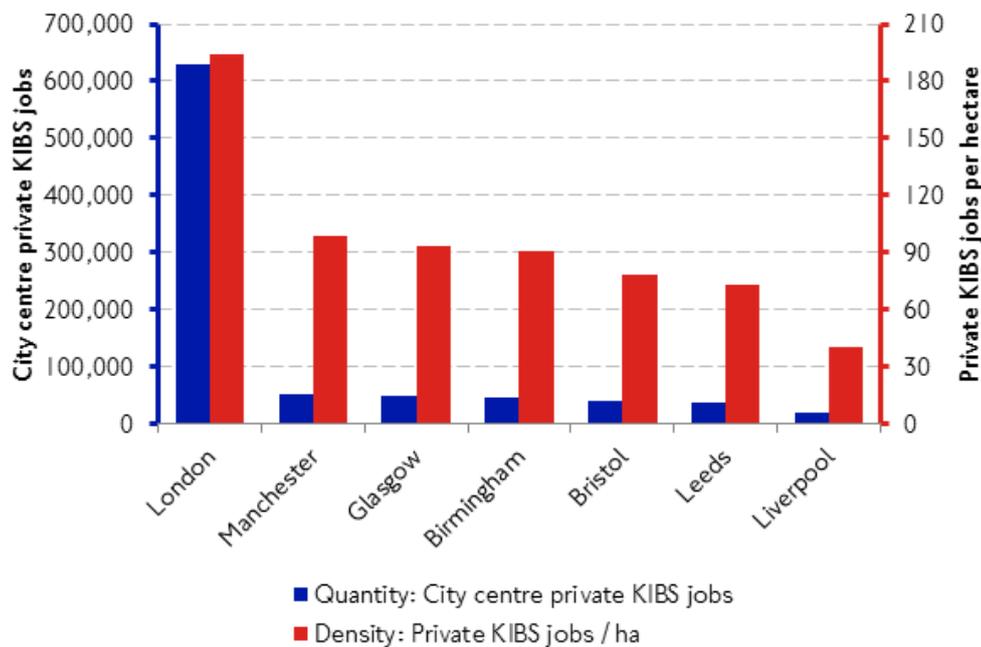

⁷ Around 1 million London workers live outside the city.

- There is in fact considerable scope to further increase employment density in London’s global employment core and to unlock substantial additional economic potential. Doing so will depend on further expanding the labour supply on which the area can draw.

The economic potential cannot be unlocked through any feasible alternative means, eg through ‘decentralising’ employment growth across different parts of London or other UK city centres

- London’s employment core hosts around 12 times the volume of Knowledge Intensive Business Services (KIBS) activity that each of the next three strongest centres host, at around twice the density, as shown in Figure 3. It is clear from this that to replicate in other UK cities the conditions that support London’s global role would require investment on a vast and likely unaffordable scale.

Figure 3: The volume and density of knowledge intensive business services jobs within seven UK city centres⁸

- While there is a strong case for making the UK’s other major city centres more internationally competitive by growing them, it is vital that this is seen as complementary to efforts to build on London’s existing strength rather than as an alternative to it. If London loses its competitiveness in the global markets in which it competes, overseas cities that can compete for these markets, rather than other UK cities, will attract much of the activity that is displaced. In this scenario the whole UK will lose out, including other cities which benefit from the interrelationships with London as a global hub. It is worth noting that cities such as Paris have plans for massive investment in new public transport to boost their competitiveness.⁹

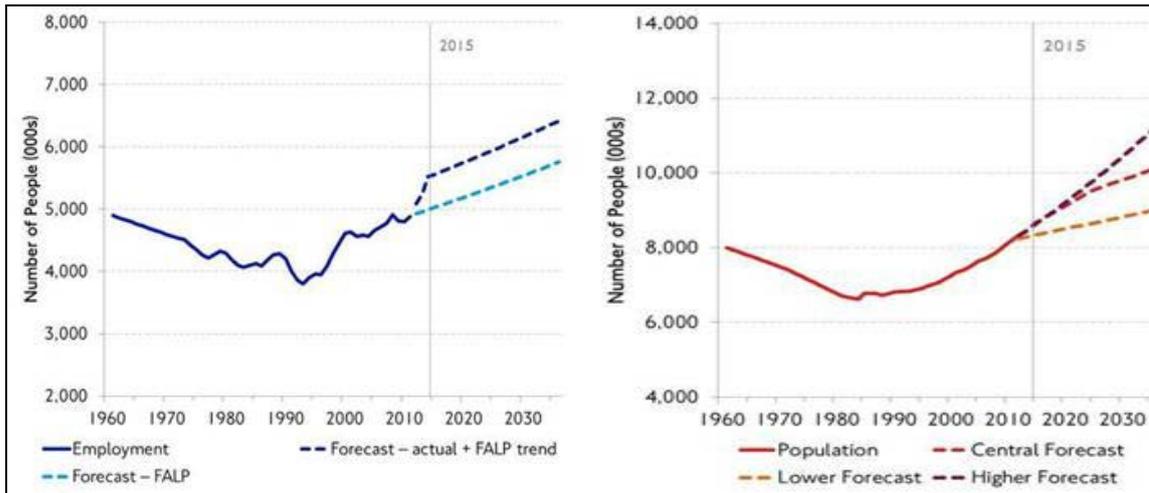

Growth in London’s employment core will drive population in the wider city and region, in turn sustaining employment growth in other parts of London and far beyond

⁸ Based on data from “Investing in City Regions,” Volterra, November 2014.

⁹ €40 billion of investment is committed to public transport to support the “Greater Paris” project.

8. London’s population is forecast to increase from 8.6m million to over 10m by 2036 while employment is projected to grow by 700,000 to 6.3 million, with recent forecasts suggesting even higher growth is possible. This depends however on supportive policies to expand the effective labour supply available in London’s key employment locations. Without these the likely outcome, based on historical trends, illustrated in Figure 4, is not stability but a failing economy and decline, with serious implications for the wider national economy. In particular there is a need to tackle the major threats that transport and housing supply constraints represent.

Figure 4: Historic trends and projected growth in London’s employment and population to 2036

9. London’s economic growth is fundamentally dependent on rail and tube capacity and connectivity – eight in ten arrivals in the morning peak are by rail (including the Underground and Docklands Light Railway). Despite committed investment, the scale of growth in travel demand is such that between 2011 and 2041, crowding is forecast to increase by 60% on the Underground and 150% on rail services¹⁰. Some of the greatest pressures on TfL and national rail services are on a north east / south west axis, which is benefiting relatively little from the current or planned investment. Whilst the current focus is on east-west (Crossrail) and north-south (Thameslink), the north east – south west axis has been acknowledged as needing additional capacity for many years.
10. The pressures are already being felt, with 8 out of the 10 busiest days in the history of the Underground being in October and November 2015. There are also enormous growth challenges on the national rail network. For example, the South West main line into Waterloo, the busiest section of the network, requires approximately 20% additional capacity to deal with existing overcrowding even before anticipated demand growth of 40% to 2043. This represents a key economic challenge since it has major implications for London’s labour supply. For example:
- it threatens to reduce people’s willingness to participate in London’s labour market;
 - access to the network is constrained at times, ie station closures owing to crowding;
 - other productive trips are crowded out;

¹⁰ There has been a shift from car to public transport over the last 15 years of around 11 per cent.

- there has already been substantial ‘peak spreading’, and further opportunities for retiming trips are limited.

To ensure London has an adequate supply of labour in the future housing supply constraints must be tackled

11. The London Plan identifies a need for 49,000 new homes per year,¹¹ while delivery has been around half this rate over the last 10 years or so. The resulting poor affordability of housing reduces the quality of life the city offers its labour force, which has damaging consequences for its international competitiveness:
 - business leaders rate the cost of housing as the second most important obstacle to improving London’s competitiveness;¹²
 - the functioning of the city depends on the availability of a variety of workers including those on lower pay;
 - the inequitable nature of access to London’s housing market is starting to damage its reputation as a city of opportunity and will affect the ability of London firms to recruit and expand.
 - there are also indirect economic impacts through impacts on disposable incomes.¹³
12. Capacity has been identified within London for 423,000 homes over 10 years,¹⁴ and the 2015 London Plan has put in place new policies to support additional supply through higher density development, linked directly to public transport accessibility. Assuming the backlog has already been made up, capacity (not yet identified) is expected to be needed for a further 500,000 homes in the decade from 2025. The London Plan identified key Opportunity Areas (including the Upper Lea Valley) and Areas for Intensification.

Despite its overall economic strength, there remains widespread and persistent social deprivation together with serious economic underperformance resulting from it

13. Tackling the inequalities in life chances that exist in London, by becoming a city of genuine economic and social opportunity for all, will not only be valuable in itself but will improve the quality of life of the city as a whole and strengthen its competitiveness. London’s complex and diverse economy depends on its ability to attract a wide range of workers at different income levels. It is worth noting that almost a quarter of London’s workforce earns less than the London Living Wage. Meanwhile, lower income workers are moving further out, leading to a ‘hollowing out’ effect and transport has become more unaffordable for such workers,¹⁵ threatening the ability of London’s core employment locations to attract the workforce balance needed in the future.

¹¹ To also address the existing backlog, 62,000 new homes per year will be needed.

¹² London First, “Home truths,” March 2014

¹³ Cushman & Wakefield Affordability Watch 2015

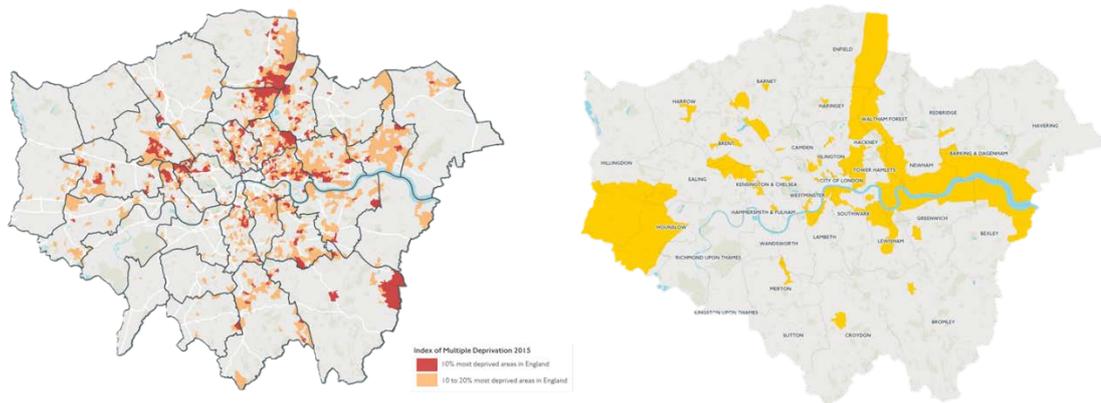

¹⁴ It will be critical in this period to ensure that the pipeline of approved units translates into delivery. Whilst on average over 50,000 housing units are given planning approval in London each year, only around 27,000 units are actually delivered. There is currently a pipeline of 261,000 approved units.

¹⁵ In 2014, it took at least an additional hour of work at National Minimum Wage to cover travel costs from outer London compared to 2005.

Furthermore, the social exclusion this could lead to could have wider consequences, damaging the reputation of the city as a place to live and invest in.

14. Pockets of deprivation exist across London and there are some geographical concentrations as shown in Figure 5.

Figure 5: The distribution of deprivation in London, 2015 (left) and London's Opportunity Areas and Areas for Intensification (right)

Some of the greatest unrealised opportunities for development are in locations in most need of regeneration

15. There is a close correlation with the Opportunity Areas identified in the London Plan, as shown in Figure 5. The Opportunity Areas:
 - are generally former industrial areas, with historically poor transport links to central London;
 - are typically trapped in a cycle of a poor quality built environment and low investment, remaining isolated from the wider success of the city;
 - represent London's main reservoirs of brownfield land and unlocking comprehensive development in them must play a crucial role in accommodating London's housing and employment needs.
16. The problems these areas face are of a scale and complexity that require coordination, in a way that markets alone are unable to achieve. New transport is a vital element and can act as a powerful coordinating mechanism for the other investment that is needed to bring about regeneration.

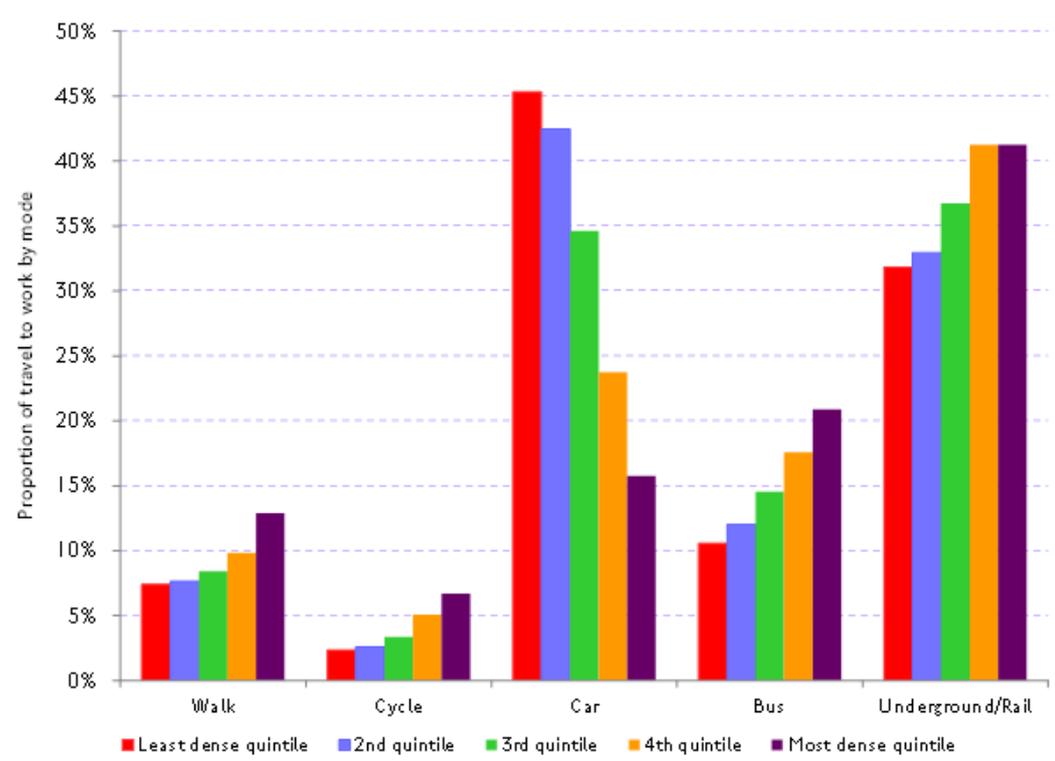

Additional housing potential must also be unlocked more widely across inner and outer London if we are to meet the overall needs identified above

17. While London’s town centres remain vital to the city’s economy, many major and district centres face decline in their traditional roles in retail and office markets. There are, however, opportunities for boosting housing supply in these locations in an affordable and sustainable way through transit oriented residential development. New connections can change market expectations, unlocking investment to make denser and better quality housing viable. This will help gain local communities’ acceptance for additional housing beyond that which they are already required to deliver. Planning policy also requires adequate transport provision as a condition for development.

Transport investment is essential to enabling the higher density development needed if London is to meet its growth challenges sustainably

18. The relationship between housing densities and travel behaviour in terms of choice of mode for journey to work is shown in Figure 6. This shows that 15% of people living in the densest fifth of London use car for travelling to work while 45% do so in the least dense fifth of the city. Given the congestion pressures facing London’s roads¹⁶, this indicates the importance of new housing being delivered through transit orient development at high densities.

Figure 6: 2011 travel to work mode shares of London LSOAs¹⁷ by density quintile

¹⁶ The rate of growth in congestion we now expect on London’s by 2031 has doubled, from 15% forecast in the MTS to 30%.

¹⁷ Lower Super Output Areas.

19. Improvements to the quality of London's urban fabric and environment will be important in maintaining and enhancing London's global competitiveness. Ensuring that new development and urban realm are well designed directly contributes to people's quality of life and well-being and will be ever more important as densities increase.

20. There are also growth pressures to accommodate more housing beyond London's boundaries. Focussing London's growth as far as possible within its boundaries is more sustainable than the alternatives and the London Plan aims to accommodate London's forecast population growth and need for housing within the Greater London boundary. Transport investment is critical to enabling the densities that this will require. Delivering more housing in reasonably close proximity to key employment areas also makes sense if we are to ensure an appropriate range of workers are available to meet London's labour supply requirements.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- **How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?**
- **What might their potential impact be on employment, productivity and housing supply in London and the southeast?**

21. In recent years there has been an ambitious programme of investment to both expand London's public transport system and renew and upgrade the existing assets. Crossrail and Thameslink will be fully open within the next four years and the programme of modernising the Underground is well underway. This scale of investment has been possible through growing fare revenues, a strong commitment from successive Governments with grant funding, and prudential borrowing.
22. Key priorities for the coming years include the re-signalling of the Circle, Metropolitan, District, Hammersmith and City Lines and the Deep Tube Programme, which will mean new rolling stock and signalling on the Piccadilly, Central and Bakerloo Lines. We also need to get the most from London's existing railways - creating additional capacity on the network by introducing faster, more frequent, metro-style services and maximising the benefits of the heavy rail infrastructure that is already in place.
23. This investment will keep London moving for the next decade or so – ensuring that the large and complex public transport network can handle growing demand and at the same time enable a shift away from car use and meet transport users' growing expectations. It is vital that this programme is continued and its importance was recognised in the provision for capital grant funding made in the 2015 Spending Review (although the implications of the removal of the revenue grant need to be more fully understood).

The need for a pipeline of long term infrastructure investment, with Crossrail 2 at its heart

24. It is clear however that a pipeline of further large scale strategic interventions to provide 'new infrastructure' are going to be needed to meet London's growth challenges beyond the next ten years. This will help drive long term productivity and improve the public finances. We are cognisant of funding and supply constraints and our aim is to develop this into a coherent, phased and manageable programme that is affordable for London and the UK, with a strong focus on managing down costs and maximising value for money. A stable long term pipeline of investment will offer greater certainty for our supplier base, allowing better planning. Failing to achieve this can add 15% to project costs.
25. London's integrated strategic planning process, with the London Plan and the MTS at its heart, provides a framework for identifying and prioritising investment needed over the next 20 years, with TfL's business planning cycle providing more detailed prioritisation over the shorter term. The Mayor has also produced a 2050 Infrastructure Plan for London which looks to the longer term.

Together, these processes address all the different dimensions, geographies and transport modes involved in a city such as London over multiple decades

26. It is likely that new versions of the London Plan and MTS will be produced for the next London Mayor. We do not want to pre-empt this wider process here – but it is clear already that Crossrail 2 will need to be at the heart of these strategies and the pipeline of schemes and the NIC must support its ongoing development as a matter of urgency. Such an intervention requires a significant commitment of resources at the planning and development stage. Without this it will not be possible to meet the timescales for delivery that are required to meet the overall strategic planning challenges that have already been identified and are generally agreed upon.

Our focus for the NIC

27. Key considerations for determining the appropriate allocation of resources for major new ‘national’ infrastructure are set out below. Given the focus of the NIC these are narrower than those which underpin the London Plan and MTS. These are intended to assist the NIC in making its recommendations to the Government on prioritisation of national resources for large scale transport infrastructure – and more immediately those required for planning and developing them. The following should be considered:
- the scope for unlocking genuine economic potential through intensifying or transforming the way land is used, as expressed through economic performance measures such as GVA, and the extent to which this is additional at the national level;
 - the key constraints that prevent people and places from realising their economic potential, including both transport bottlenecks and shortages of housing;
 - the wider impacts including the sustainability implications of alternative strategic choices;
 - the ‘economic payback’ of large scale infrastructure investment and the implications for national level funding through the impacts on fiscal receipts associated with the economic performance benefits;
 - the opportunities for regional and local funding from development that is unlocked and other sources;
 - the pressing nature of the strategic challenges and the timescale for addressing them, in particular the threats to continued growth arising from constrained transport capacity and inadequate connectivity as population pressure increases.
28. The current MTS and London Plan both contain explicit support for prioritising a major new radial rail route serving central London on a northeast – south west axis and the Strategic Outline Business Case submitted to the Government in June 2015 sets out the case for this in detail, together with the expected impacts on capacity, journey times, housing supply, employment and productivity.
29. In particular, the scheme provides a major expansion of the system of radial transport links serving London’s global employment centres. This will relieve the growth constraints that are expected by the time it is due to open in the early 2030s. As well as solving a series of critical transport bottlenecks, it will connect the network serving London’s global employment centres to major

development areas, facilitating the dense new housing needed to help meet London's long term labour supply requirements. The key benefits include:

- crowding relief to a network forecast to be operating under stress despite significant planned and committed transport investments reflecting a combination of faster and more direct journeys, less crowded conditions on-train (notably SW, WAML, Victoria and Northern lines) and relief of crowding and delay at key stations, such as Waterloo, Liverpool Street, Euston and Vauxhall. For example, the scheme would contain growth in national rail demand at Waterloo - which currently stands at 82 million passengers per year - to 13% growth by 2041, rather than 50%;
- significant journey time benefits, eg a reduction of around 15 minutes between Wimbledon and Tottenham Court Road;
- 200,000 net additional homes (with appropriate new planning policies in place) over 20 to 25 years across London and the SE (the Crossrail 2 Growth Commission is reviewing this and an update will be provided to the NIC as part of TfL's 12 February submission). The land value uplift associated with these close to route homes only, and the associated impact of improved transport capacity and connectivity on housing density they represent, has been assessed at £15bn PV;
- once operational, up to 200,000 new jobs - between 50,000 and 70,000 new local jobs as a consequence of enhanced development, and some 135,000 in central areas;
- in addition there would be temporary employment of up to 60,000 construction jobs (including supply chain).

30. As part of the development of Crossrail 2, many alternatives have been considered, including on Network Rail solutions as well as alternative schemes. While it is feasible for a package of alternative schemes¹⁸ to address some of the problems in the same corridors, there are considered to be no feasible alternative schemes, either individually or cumulatively, that could generate the combination of capacity and connectivity benefits that offer the transformative impact on economic performance that Crossrail 2 is expected to bring about.
31. The critical feature of Crossrail 2 is that it provides large scale new capacity across central London that addresses a series of bottlenecks associated with the mainline termini and onwards links from them. In contrast, improvements to national rail corridors in isolation would place extra pressure on London's crowded main termini, and on key pinchpoints on the Underground network. For example, while four tracking the West Anglia mainline is a prerequisite to Crossrail 2, its full benefits are contingent on the extra capacity within and across central London that Crossrail 2 delivers. Similarly, the benefits of increasing capacity on the South West mainline depend on the elimination of other bottlenecks on the routes that link it to the main employment centres.
32. By tackling a series of critical network bottlenecks and creating new and better connections (easing housing supply constraints on future labour supply), Crossrail 2 will facilitate a significant increase in the overall economic density of London's key global employment centres. This is the basis for the estimated increase in numbers of jobs of 135,000 in these very high value areas. The resulting net

¹⁸ for example four tracking the West Anglia lines between Tottenham Hale and Broxbourne, with five tracking improvements into Waterloo

additional Gross Value Added (GVA) to the UK economy is estimated to be in the range of £1.2bn – £7.9bn per annum by 2041 (ie up to £102bn). This analysis shows how Crossrail 2 offers the opportunity to achieve significant increases in the productivity of London and the UK and to cover much of its costs through increased wealth generation and tax receipts. Nevertheless given the widely dispersed nature of the issues that together need addressing if London is to meet its strategic challenges effectively, it is clear that no single scheme will on its own be enough.

33. We are asking the NIC to recommend that the Government take the necessary steps to enable a Hybrid Bill to be submitted before the end of this Parliament. This requires an application for statutory powers in the coming years which would allow the delivery phase to commence in 2020 and the scheme to open by 2030. The sponsorship and consent costs associated with this are £250 million and we are seeking the NIC's support for funding from the Transport Development Fund for a significant proportion of this. If insufficient funding is made available for these activities there is a risk of setting the project back by at least half a decade, which could constrain London's growth.

Integrating more areas into the transport network

34. This is why Crossrail 2 is the focus of our ask to the NIC. Nevertheless given the widely dispersed nature of the issues that together need addressing if London is to meet its strategic challenges effectively, it is clear that no single scheme will on its own be enough.
35. A mixture of further strategic, intermediate and smaller scale schemes is needed beyond Crossrail 2 to unlock development and tackle particular challenges by knitting more parts of the city into the transport network. This will fill gaps in connectivity to enable more areas of the city to fulfil their potential, help address London's housing challenge, and ensure Londoners can access the opportunities and benefits of the city's growth.
36. This includes schemes such as a Bakerloo Line Extension, which will improve connections between central London and key opportunity areas in south east London, unlocking major housing potential and an extension of Crossrail beyond Abbey Wood towards Ebbsfleet which will help realise the housing potential of a key area of the Thames Gateway. These will help develop other corridors that complement the cross London 'spines' of Crossrail, Thameslink and Crossrail 2.
37. We are not seeking funding from the NIC for these other schemes but would welcome the support of the Commission for greater devolution of powers and funding mechanisms to enable cities like London to develop and progress such a pipeline of investment to help drive economic growth for the UK and tackle the challenges we face.
38. For example, in more recent years there has been an increasing focus on ensuring a similar 'upgrade programme' for our roads, as well as rail. London's roads are vital to the efficient day to day movement of people and goods and in fact support the majority of journeys made in the city. The Roads Modernisation Plan represents the first tranche of investment associated with this programme. It does not however provide sufficient funding to realise the fuller vision; in fact a large funding gap exists for sustained and more strategic roads investment.

39. Unlike public transport modes, which generate revenue from fare payers, there is very little cost recovery on the roads. Under the new system of VED announced by Government, revenues will be ring-fenced for spending on strategic roads in England (those operated by Highways England) from 2020/21. It is vital that the strategic road network within London (which was transferred from the Highways Agency in 1999) also benefits from this funding stream, with projects such as New Thames crossings vital to unlock jobs, homes and growth across the east of London by addressing the severance that hinders integration of the economy north and south of the river.

40. TfL is working on a number of these potential infrastructure options to address the range of different challenges which will inform the development of any new MTS. But these are not alternatives to Crossrail 2.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

See separate submission with agreed deadline of February 12th .

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- **What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?**
- **What innovative funding mechanisms could be considered to support delivery of key schemes?**

41. Following the 2015 Spending Review, TfL's Operating Grant is being phased out; and, in light of the prospective full devolution of business rates, it is possible that from the 2020s funding of the renewal and upgrade of TfL's core Underground and rail network will come entirely from non-Government sources (i.e. a combination of fares, third party income and local taxes such as council tax and business rates). This represents an unparalleled step-change in TfL's relationship with central Government as TfL transitions to financial self sufficiency.
42. London is unique in that many of its transport projects have a substantial economic benefit and are partly or even fully self-funding, even under the current fiscal regime in which less than ten per cent of taxes paid in London are retained in London. The extent to which different schemes require central Government funding varies, with schemes such as the Northern Line Extension being entirely locally funded through developer contributions and retained growth in business rates. Crossrail has a Government contribution of around one third of the cost.
43. Building on PwC's 2014 Funding and Financing Study, the Crossrail 2 Business Case shows that London could contribute over half of the funding for the project, through direct contributions and borrowing against a variety of sources:
 - Net revenues generated by train operations;
 - Over Station Development / sale of surplus land;
 - Continuing the Mayoral Community Infrastructure Levy (CIL), at an increased rate;
 - A continuation of the Business Rate Supplement (BRS) – currently hypothecated to Crossrail 1 – beyond the repayment of Crossrail debt;
 - continuation of the London-wide Council Tax Precept originally established for the Olympic Games, currently due to end after 2017/18.
44. If we are to be able to increase London's contribution to Crossrail 2 (and fund other needs of a rapidly growing city at the same time), then we need to enhance London's ability to capture and retain the additional revenues that will result from the economic benefit of major transport improvements, including effects on property values and business taxes. This could include consideration of:
 - Stamp duty land tax (e.g. as a 'payment by results' mechanism within specified zones where growth in housing would be unlocked, or more widely, linked to delivery of housing targets);
 - Enhanced retention of business rates (including the proceeds from revaluation as well as stock growth);
 - Reform of residential property taxes (council tax)

- Borrowing capacity for opportunistic early land acquisition around planned transport investment corridors (as many local authorities, who do not face the same borrowing restrictions, do);
- CPO and MDC power to assemble land ahead of formal funding announcements;
- TfL to acquire land compulsorily not only for transport, but also for regeneration and housing;
- TfL to grant long leases on new residential buildings above its stations;

45. Some local sources of funding have limits. Fares on the Underground network are already quite high in London relative to other major cities around the world, but TfL currently does not achieve an operational surplus on its business as a whole so as to be able to fund major incremental capital investment. The ability of the Mayor to impose higher local taxes or to raise debt is severely constrained by central government. Congestion charges already fund a proportion of investment on the roads network, but in fact, relatively little revenue in London is raised from the roads, in stark contrast to the over 30% of TfL's income that comes from Underground and other fares. This means road improvements are either reliant on central government grants or contribution from public transport users. The Silvertown project will be funded by new tolls on road users, which could offer a model for a way forward for some schemes, but will not help solve the wider problem of how to provide the funding needed to cater for a growing population.
46. Londoners pay about £0.5 billion a year through Vehicle Excise Duty (VED). This money currently goes to central Government for general public expenditure, but from the end of the decade, all VED in England will go into a Roads Fund to pay for sustained investment on the English Strategic Road Network (the network managed by Highways England). Given that VED is linked to the specific address of the vehicle owner, there is a particularly strong and justifiable basis for hypothecation of the revenue raised in London for use on its strategic roads or transport infrastructure, or devolution of the power to determine VED structure to London.
47. It is likely however that even the sources set out above will be insufficient to fund the investment needs of transformational schemes such as Crossrail 2, as TfL has made clear in its submission. Crossrail 2 also generates a very significant proportion of its transport benefits (around 30%) from origins outside London, as well as housing impact in the wider South East, national supply chain impacts, and significant employment and productivity gains at the national level, so in the absence of more radical devolution proposals (which are likely to be many years hence), support from the Exchequer is both appropriate and necessary.
48. As regards financing and delivery, TfL's investment programme is financed using a mix of sources including borrowing from the PWLB, from the capital markets, and using private finance in models for projects such as the Silvertown river crossing. In each case, the decision is made based on value for money considerations.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

49. There are a handful of city regions in the world of a similar scale and level of development to London¹⁹, including Paris²⁰, New York²¹, Hong Kong²² and Singapore²³. While all of these cities face competitive challenges, London is growing at a faster rate than the others²⁴. All have policies in place that seek to encourage higher density development around rail stations, reduce dependence on the private car and support greater use of sustainable modes. London can be regarded as a strategic planning leader, with well integrated land-use and transport strategies in place to deliver sustainable growth. It has been unique in delivering a major shift away from car and to more sustainable modes in terms of relative shares (around 11% since 2000). However, compared to other cities the funding to support growth is less secure and the time cycle for funding is not integrated with planning cycles.
50. In Paris, the planning authorities and RATP have developed a long term land-use planning and transport investment strategy, known as 'Grand Paris' with an estimated investment requirement of €200 to €300 billion of investment to 2025 (although this horizon is now expected to be extended). The plan includes 100 major urban reconstruction projects and is expected to deliver approximately 70,000 housing units per year as well as office space through densification of urban areas around new stations. Investment of €40 billion in public transport is envisaged, with a significant emphasis on improving orbital connections between existing outer high density housing areas. It is however important to recognise that the spatial development context in Paris is very different to London's, with greater constraints in the city centre and a more polycentric pattern of employment, which is less reliant on agglomeration benefits.
51. The city state of Singapore has had a consistent strategic policy approach towards growth and development since 1971, based on transport-orientated development along mass transit spines connecting into the central business district (CBD). Since the early 1980s Singapore has been investing in expanding and improving its metro network to improve access to the CBD. Bus services act as feeder services, with easy interchanges at metro stations and don't duplicate metro lines. The Land Transport Authority (LTA) owns metro infrastructure and invests in new capacity. There are plans in place to double the length of the metro network by 2030. Funding is provided by Government and future fare incomes, which support borrowing. Around a third of the operator's revenues are raised from non-fares sources, such as rental incomes and advertising at metro stations.
52. MTR, the urban transit agency of Hong Kong, is notable for being very active in property development not just at stations but in the catchment areas around them. The government grants

¹⁹ The population of London's metropolitan area is 13.9m using the Eurostat definition. The wider labour market catchment, extending across the wider south east has a population of 23m (GLA).

²⁰ The Greater Paris population is around 12m.

²¹ The population of the metropolitan area of New York is around 12m, with around 20m in the wider labour catchment area.

²² Hong Kong's population is 7.6m.

²³ Singapore's population is 5.5m.

²⁴ Around 1.5% p.a. in London and between 0.5% and 1.3% p.a. in the other cities.

exclusive property development rights for land in the vicinity of metro station areas to MTR below market rates. Hong Kong has been a pioneer in using this approach to fund railway projects, and other cities are increasingly looking to implement it. TfL's land holdings are more localised than MTRC and focussed on operational requirements, and there is a much more circumspect approach to the scope of planning powers, which means only land needed to meet railway requirements can be included at present.

53. New York also has a different spatial pattern to London, heavily affected by its specific site and the density of commercial and residential development in Manhattan. Plans in New York include an additional subway (2nd Avenue) and better connections between the boroughs. New York's funding reflects the set up of city, states and federal levels, and includes cross subsidy from road crossings and a small but significant employment tax. There is also the use of developer contributions for specific schemes (such as the Hudson Yards). It is worth noting that New York is receiving 50% of its funding for the 2nd Avenue & East Side Access projects (as well as 50% for the emerging proposals for a new Hudson River rail capacity project) from the Federal Government – higher than Crossrail 1 or the proposals for Crossrail 2.

Appendix 2 - Setting London in context

The challenges of growth

1. London's infrastructure challenges are closely tied to population growth, which in turn reflects the strength of its economy. London's population is growing rapidly, with the city recently eclipsing its 1939 peak of 8.6 million people. Current projections suggest that London will reach 10 million by 2030 and 11.3 million, more or less, by 2050. Such rates of growth will place significant pressure on London's infrastructure systems - most notably housing and transport, but also energy, water and social infrastructure. There are also key economic, social and environmental implications. In order to manage growth successfully London will require a significant programme of infrastructure investment, alongside innovative approaches to infrastructure and development that will allow us to be more efficient, particularly in the context of reduced availability of funding and natural resource constraints.
2. Growth is in many respects a reflection of London's success – a testament to its productivity and competitiveness, the positive international perception of London and its status as a global city. People want to live and work in London, and businesses want to invest here, recognising the opportunities London provides. But unfortunately growth brings challenges and distortions – particularly to the housing market and also in terms of infrastructure capacity. In order to sustain London's position as a top tier leading city in the global economy, further investment in infrastructure is required to increase productivity and quality of life. Despite the challenges growth brings, research undertaken for the GLA suggests most Londoners are positive about growth. A recent telephone survey with 1,000 adult Londoners found that more than 60% of Londoners believe growth will benefit them; the challenge will be to ensure this is the case¹.
3. Ensuring London meets its infrastructure challenges is not just an issue for London, but indeed the rest of the UK due to the significant contribution London makes to the UK economy. Output per worker is significantly higher in London relative to other UK cities, with London's GVA per hour standing at £38.80 in 2013 rising to £42.80 in Inner London, compared to £31.10 for the rest of the UK². London also makes a significant net contribution to the national exchequer
4. A skilled workforce combined with a comprehensive transport system enables this higher level of productivity, allowing for agglomeration benefits and a competitive clustering of jobs, business and economic activity. Despite recent investment, we know that London's transport network is undermining productivity due to capacity constraints – even after accounting for Crossrail 1, and house prices are serving as a disincentive to locate in the capital for many workers. London's rate of productivity growth lags rival global cities such as Paris and Madrid.
5. Research undertaken by GLA Economics found that other parts of the UK benefit from proximity to London due to spillover effects, and as such maintaining productivity in London is essential to ensuring the on-going growth of the UK economy. Efforts to rebalance the economy should not be at London's expense; rather they should be in tandem with investment in the capital.

Work undertaken to date: The London Infrastructure Plan 2050

6. In 2014 the Mayor published the London Infrastructure Plan 2050 (LIP2050) to ensure that London has the infrastructure it needs to remain one of the best cities in the world in which to

¹ Telephone survey with 1000 adult Londoners in March 2015

² GLA Economics, 2015, 'Productivity in London'.

live, work and do business. The LIP2050 sets out a series of expectations regarding the delivery of infrastructure in the 21st century – digitally connected, green, integrated, innovative, and understood as a system of systems. The LIP2050 acts as an evidence base for an on-going, strategic conversation about London’s future infrastructure requirements, and has strong potential to inform the development of a new National Infrastructure Plan. It will also inform the mayor’s statutory strategies which will require revision following the Mayoral election in May 2016 – these include the London Plan (the overarching strategy for the capital and London’s spatial development plan), Economic Development, Transport and Environmental strategies.

7. In view of environmental and fiscal constraints our analysis found that London as a city needs to operate more efficiently and sustainably in order to meet its future infrastructure requirements. Investment in the context of growth should be targeted at improving productivity, increasing resilience and promoting sustainability.
8. In the recent past, the Mayor has focused on leveraging infrastructure investment to unlock housing development (and to obtain financing for infrastructure from development, as was done with the Northern Line extension – an innovative model which can be imitated elsewhere). However, in the longer term, the expectation will be that investments in new infrastructure will be made in tandem with smarter land use, improved planning and coordination of infrastructure relative to development.

Other elements of the London Infrastructure Plan

9. London’s infrastructure requirements beyond transport are significant, and at the heart of these requirements is housing. Increasing housing supply is the number one challenge facing London as a city. The London Plan sets out a target to build 49,000 homes a year to meet historical and arising housing demand. Such a number requires a near doubling of current output, to a level of supply not seen since the 1930s. Infrastructure, (particularly transport infrastructure) is one of the key levers available to unlock sites for housing development throughout London. As a case in point, the impact of Crossrail’s arrival in 2018 can already be seen, with more than two fifths of planning applications within a kilometre of a Crossrail station citing the new railway as a justification for the development proceeding – equating to around 53 million square feet of residential, commercial and retail space.
10. Infrastructure has the ability to make sites viable for development, and as such it is important that it is planned, delivered and coordinated with this in mind. There is also a need for the public sector to be more active in capturing the value generated by infrastructure investment, as this will allow for further investments, and provide a funding source.

Utilities

11. Housing and transport are not the only areas for further infrastructure investment. In order to ensure sustainable growth outcomes, attention also needs to be given to the key utilities which underpin the effective functioning of London, including water, digital connectivity and energy. Ensuring delivery of these required services is complicated by the fact that the Mayor does not have strategic authority over these areas, even though the Mayor is required to set the overall development strategies for the city.

Water

12. A growing challenge for London, with key issues relating to water security, flood risk and water quality needing to be addressed. Estimates put forward as part of the LIP2050 work identified an emerging supply and demand gap reaching 10 per cent by 2025, and this could be exacerbated by issues such as a failure to address leakages or encourage more sustainable rates

of consumption. The GLA is working with London's water companies and Ofwat to address some of these challenges; however as part of later stages of the work of the National Infrastructure Commission it will be important to identify how these challenges can be collectively managed in a cost effective but responsible way.

Digital infrastructure

13. This should be viewed as a utility. Provision of high speed, ubiquitous access to the internet is essential to the effective operation of a global city such as London, particularly from an economic perspective due to London's deep economic specialisations in finance, creative and digital services. The continued existence of 'not spots' both for residents and businesses across the city, including in its economic centre, suggests that the market is not operating effectively; such obvious market failures require much stronger intervention by the Government, with suitable state aid exemptions negotiated from the European Commission as necessary.

Energy

14. London's energy infrastructure needs to be developed in the most cost effective and sustainable way, with a focus on ensuring security of supply and meeting future demand. The LIP 2050 identified a 20% increase in energy demand can be expected by 2050 (after measures to reduce demand). To respond to this, government must double investment to ensure enough zero carbon energy is supplied to the national grid. We also need to ensure sufficient investment ahead of demand to unlock development sites. One in five of London's substations has less than 2MW spare capacity, however a large commercial development in London can use 8MW – and as such lead times are increasing to get connected. In order to address such issues a stronger policy of allowing investment ahead of need in the electricity infrastructure system is required.
15. Energy efficiency is vital to meeting the UK's climate change targets, and is one of the most cost effective means of reducing CO2 emissions. In tandem with efforts to address supply, such demand-side approaches should be considered as part of the work the National Infrastructure Commission is undertaking. A particular focus of this work should be on addressing the efficiency of London's existing building stock. London has some of the oldest and most energy inefficient building stock in Europe and it is expected that 80% of these buildings will still be standing in 2050. There is a need to retrofit this building stock through means such as insulation to reduce levels of energy consumption. London is already pursuing a number of programmes to address this issue, including the successful retrofit programmes RE:NEW and RE:FIT. Over 113,000 homes and 450 public sector buildings have been retrofitted as part of a Greater London Authority programme with more projects in the pipeline.
16. The inclusion of energy efficiency as a national infrastructure priority is supported by a wide range of stakeholders and businesses, including by the CBI. I hope that you will give consideration to this issue and that London can play its role in delivery an energy efficiency infrastructure programme.

Costing London's infrastructure requirements

17. Work in developing the LIP2050 was underpinned by a comprehensive cost model developed by Arup, which will continue to evolve to reflect changing priorities and assist with prioritisation and spatial planning. The analysis attempted for the first time to understand the magnitude of the full costs of London's infrastructure needs, including that of maintaining or replacing much of the existing asset base.

18. The headline figure from the Arup report is that total required investment in London's infrastructure between 2016 and 2050 will reach £1.3 trillion. Our projections show that London will need to increase its level of expenditure relative to GVA output by some 1.5% to meet its growing infrastructure requirements through to 2050, with costs doubling as a proportion of the economy over the next decade, but declining as a percentage of the economy after 2030.
19. While these estimates are based on an ambitious, policy-compliant scenario (including meeting our housing targets, decarbonising the electricity supply, and securing the necessary investment in transport), they indicate the scale of investment required, and are perhaps not unexpected given the resumption of net population growth after 75 years of no net growth at all.. Housing and transport make up over three quarters of total projected capital expenditure.

Delivering London's infrastructure

20. Work on the Infrastructure Plan highlighted a number of institutional barriers affecting the delivery of London's infrastructure, including split governance across and within sectors, varied regulation and lack of coordination. My setting up of the London Infrastructure Delivery Board was one response to these issues. It is made up of key infrastructure stakeholders in London, including the utilities across the infrastructure sectors (energy, water, digital etc.), as well as business, boroughs, regulators and Government representatives.
21. Some of its recent initiatives have included developing the London Infrastructure Database and Mapping Application, which aims to bring together information from a range of sources to support the planning, joined-up delivery and coordination of infrastructure across the capital. The mapping application identifies planned investments relative to growth and infrastructure capacity – and it provides a strong evidence base to inform future discussions around London's future infrastructure requirements on a spatial level. Other areas of focus of the Delivery Board have included testing best practice delivery in growth areas; and also advocating regulatory reform.

Regulatory challenges

22. The need for regulatory reform to support infrastructure investment is clear. The Mayor is concerned that regulatory frameworks are inhibiting development, innovation and higher levels of efficiencies. Much of London's infrastructure – water, energy, digital; is in the hands of the regulated utilities. The regulations in place successfully protect consumers from unnecessary price rises; however there are some unintended consequences. These include the fact that the Mayor has no direct influence over investment decisions, despite being elected to have strategic oversight of planning in the capital. The London Plan is not a statutory consideration as part of the process of approving business plans by the regulators.
23. In addition, regulations do not support appropriate levels of investment ahead of demand at particular locations where growth is expected to occur (and is occurring). Increased flexibility or new models of delivery are required to secure earlier investment on a more strategic basis. The GLA is committed to working with the regulators to address these issues through bodies like the UK Regulators Network.
24. In view of these issues the GLA is therefore keen to ensure that regulators require the utility providers to have regard, in particular, to the London Plan and its economic and demographic forecasts; that they require utility providers to share their plans as they develop; that they adopt more of a rolling forward planning approach (rather than fixed terms); that they take a much longer term horizon in key sectors like water and energy; that they allow for more investment ahead of demand, with a risk and reward sharing model, so that infrastructure is in

place before development comes rather than afterwards; that they encourage much more open data and sharing of data, including of future activity (via the mapping application above); and that they incentivise innovation.

Funding and financing London's infrastructure requirements

25. When developing the LIP2050, our original estimates of London's infrastructure needs were based on a number of ambitious policy scenarios, including aviation. The Plan determined that the cost of London's future infrastructure requirements are high and a significant funding gap of £135 billion is likely to emerge by 2050 when comparing expected costs against current sources of revenue.
26. To meet this challenge the Mayor has argued for fiscal devolution in order to help London better meet its funding gap. If London controlled more of the tax revenues it generates, it would be better positioned to incentivise growth and address its unique infrastructure challenges. The recent announcement by the Chancellor promising to devolve business rates is an important step forward (and welcomed), but it still is not enough to meet London's future funding challenges. More needs to be done to devolve the full suite of property taxes raised in London as recommended by the London Finance Commission, and enable new local funding mechanisms.
27. New forms of fiscal devolution to better capture value and create self-funding infrastructure schemes such as stamp duty increment zones, VED devolution should be prioritised. Increased devolution would ensure that larger infrastructure schemes could be realised faster through new or increased use of alternative funding mechanisms, such as business rate supplements, tax increment financing and enterprise zones. We have demonstrated successfully through the Northern Line extension and Crossrail the applicability of such funding mechanisms in the London context.
28. Longer term fiscal opportunities may include. London or wider South East payroll taxes or income tax supplements (either in lieu of tax cuts or additional) hypothecated for investment. A recent survey of Londoners found that around 60% of Londoners were willing to pay more income tax by giving up part of a tax cut in return for increased infrastructure investment³. Wales and Scotland, much smaller economies, have such powers on a much greater scale – as do many other cities and regional economies worldwide. London is much more reliant upon national decision making and national spending transfers than comparable cities: for example 74% of GLA and borough expenditure is funded from intergovernmental transfers, compared to equivalent figures of 31% in New York and 18% in Paris⁴.
29. These approaches provide London with increased capacity to address its own needs – enabling new financing and funding mechanisms and improved accountability. It will also remove a layer of the political process in realising infrastructure in the capital, speeding up delivery and approval. Without the funding levers to invest appropriately, the mayor's capacity to invest in infrastructure will be severely constrained.

³ Mayor of London, July 2015 – telephone poll of Londoners

⁴ London First, 2015 'London 2036: an agenda for jobs and growth'.

Greengauge 21 consultation response to National Infrastructure Commission: London's Transport Infrastructure

Greengauge 21 welcomes the opportunity to respond to the National Infrastructure Commission call for evidence.

In the first part of our response, we explain why a strategic framework, currently lacking, is needed to consider investments such as Crossrail 2. We put forward common criteria that we believe should be considered in all major (transport) investment decisions. The second part responds to the specific issues raised in the London's Transport Infrastructure consultation.

(i) The need for a strategic planning framework

The Northern and London transport initiatives are being considered by the NIC against a backdrop of continuing high annual rail demand growth and of major investments in the rail sector (and a substantial highways investment programme too). It is clear that substantial further investment will be necessary.

Our contention is that there is (still) no overall strategic plan or vision for the development of the national rail network. The risk is of failure to plan effectively the many interfaces and potential overlaps between projects, with the attendant dangers such as wasteful or even nugatory expenditure; untenable levels of disruption to services and local communities; and spikes in demand for the supply chain. Crossrail 2 would benefit from a wider rail strategic plan for London and the wider South East.

We recognise the planning work that Government (through DfT), Network Rail and the ORR undertakes to establish 5-year investment programmes for rail. But there is no longer term strategy.

We believe that there needs to be a *rationale* for new project possibilities set at a national level to help form the narrative on the need for such schemes, and to complement the business cases that project promoters (*e.g.* TfL and TfN) will be developing. Under EU law, while the recent precedent with HS2 may suggest otherwise, there is possibly a legal need for a strategic environmental assessment, and the wider strategy we call for could address this need or agenda.

Greengauge 21, through its Public Interest Group formed in 2008, with sponsorship of the English RDAs, Network Rail, TfL and many other public authorities across Britain, created a national strategy for high-speed rail ('Fast Forward', published in September 2009).

With appropriate support from stakeholders, building on its experience with high-speed rail, Greengauge 21 is seeking to develop during 2016 a broader *national rail development strategy*. This will include consideration of high-speed rail, but look more widely, at all forms of rail operation, passenger and freight. It will also consider the important interface between the national network and city region metro systems – a neglected area of study and one which is of particular relevance to Crossrail-style projects – projects which, in general, we believe are a highly effective way of developing the rail network. We would welcome exploring how it can be used to serve the National Infrastructure Commission objectives going forward.

In that work, we plan to develop clear criteria applicable across the nation when considering major rail investment options. We have identified five criteria that we believe the Commission should apply to the Northern and London cases – and indeed to all future transport investments of significant scale. These are:

1. Regional (and city region) economic need
2. Housing growth need
3. Capacity need
4. Implementation sustainability
5. Compatibility (with other projects and with changed circumstances) and sequencing.

The first criterion – regional (and city region) economic need – is straight-forward: there must be spatial plans. London, uniquely, has such a plan for 2050, provided under its statutory obligation from the Greater London Act.

Greengauge 21 considers it is essential that London's plans are kept up-to-date, developed comprehensively, with private sector inputs, so that a contemporary account of economic development outlook is available at all times. Otherwise, transport (and no doubt other) investment can only be considered in a vacuum.

Crossrail One was, in our judgement, ultimately given Government approval to proceed because of the existence of a clear long term expectation on the scale and location of the capital's future population and employment growth. Without wider

plans or frameworks, transport investments risk being distorted towards meeting existing/short term/foreseeable transport network congestion issues or other shortcomings: the investments may still be worthwhile, but they are unlikely to be transformational and will leave open to chance whether wider economic and housing policy objectives are met as fully as they could be.

The existence of long term, spatially defined, growth plans in the London case goes a significant way towards meeting the second criterion (housing growth need). But it also serves to highlight the problem in the surrounding shire counties, where previous regionally-set housing growth targets have been squandered. Planning Crossrail 2, for example, which is said to 'connect Surrey with Hertfordshire', is hindered by the lack of longer term quantified and spatially-based plans for these counties. Greengauge 21 urges the Commission to call for this lack to be made good. The Commission is well-placed to consider questions like overheating of the housing market in London/Southeast (and the apparent lack of demand across much of the North).

The third criterion – capacity – needs to be driven by a range of demand growth scenarios which include a continuation of recent trends as well as the lower, more cautious forecasts used by DfT.

Consideration needs to be given to *what if* scenarios, rather than a single central demand forecast (including the effects of policy or technology shifts; funding availability and implementation slippages; market trend inflections). This should include thinking about *flexibilities* with operating pattern assumptions and hence wider outcomes.

There is a particular gap presently in the area of freight forecasts where major revisions are needed to take into account the possible impacts of port developments – especially Thames Gateway – and the emerging markets for rail in meeting domestic logistics and distribution network needs, including into urban centres.

And when considering capacity, the closely related area of punctuality performance needs to be addressed as well. There are often non-infrastructure solutions to capacity problems that are appealing for cost reasons but leave the network – which is already busy – overloaded and subject to poor punctuality performance.

The fourth criterion – implementation sustainability – is intended to help guide the nature or version of specific interventions and projects, applicable on a consistent basis across the nation. It has three distinct components:

- The ability of the region/corridor served to sustain any adverse environmental impacts, and specifically, the loss of land currently not used for transport;
- The likely impact on land use development, summarised on a single dimension of inducement towards densification/intensification of existing developed/formerly developed ('brownfield') land at one end of the axis and new development ('greenfield') and dispersion/sprawl at the other end; this is a key indicator for wider carbon/energy outcomes;
- The ability of the region's/corridor/s transport system to sustain economic objectives during periods of disruptive construction.

In effect, work in this area should help guide the type of investment needed: whether it would be better to upgrade existing or to go for new build; to serve existing urban developments or foster and encourage new settlements; to propose new transport infrastructure at-grade or in tunnel, and so on.

The fifth criterion – compatibility and sequencing is often missing from project-specific appraisals and gateway reviews. Applicable at project level, a compatibility matrix for Crossrail 2 covering rail investments is shown below. There is a high level of complementarity, with some other projects representing real opportunities for integrated designs and cost savings – in particular, the planned upgrades for the South West, Brighton and East Coast Main Lines as well as the possible DLR extension from Bank to Euston and plans to connect Stansted better with central London (which could be achieved with a Lea Valley upgrade scheme or with a totally new alignment – the latter having the potential to address wider issues such as ECML capacity).

Many projects are complementary and some would feed traffic onto Crossrail 2. Long term plans to increase tube line capacity (e.g. the Piccadilly Line) may, on the other hand, have an adverse impact on the business case of Crossrail 2 and the Thameslink project and other plans to improve Stansted connections could substitute in part for Crossrail 2 (but equally, with care, could act as good complements too).

Other project interfaces we judge most likely to be overlooked that represent real opportunities that could be precluded (or made costlier) by Crossrail 2 implementation include the outline plans for an outer London orbital railway in the London 2050 Plan (the scheme shown uses the same railway between New Malden and Teddington as Crossrail 2), and the DLR extension to Euston where an integrated station design could bring wider benefits to both projects.

Crossrail 2 Compatibility Matrix

COMPLEMENTARITY				PROJECT	OVERLAP	
Integrated design opportunity = ££ saving	One project feeds the other	Precursor project, builds market for Crossrail 2	Independent		Partial substitute, so business case impact	Clear alternative
▪		▪		SW Main Line Upgrade	▪	
▪				Brighton ML Upgrade		
▪				ECML Upgrade		
			▪	GEML Upgrade		
▪	▪			DLR Euston Ext		
				Tube capacity	▪	
			▪	Northern Line Ext		
			▪	Croydon Tramlink devt		
	▪			London 2050 plan orbital rail		
	▪			LHR southern access		
	▪			HS2		
▪				Stansted Express & Lea Valley scheme		▪
▪			▪	Crossrail 1 Extensions		
				Thameslink	▪	

The related question of sequencing is not the same as phasing. It concerns questions of what actions/investments are precursors for others and what might be precluded subsequently by early decisions, as well as optimum timings. It is crucial to thinking about strategic fit and meeting one of the criteria that Sir David Higgins identified for HS2: standing the test of time.

(ii) London's Transport Infrastructure

Developing London's transport infrastructure has involved lengthy timescales, and in some cases policy reversals: the abandonment of the 'Northern Heights' underground line extensions in the 1940s and the partial implementation of the London ring motorway schemes in the 1973 Greater London Development Plan before their abandonment serve as lasting examples.

Lengthy planning timescales allowed schemes such as the Victoria Line (1960s) to be designed to achieve key customer benefits such as the cross-platform interchange between the Victoria and Bakerloo lines at Oxford Circus. Subsequent tube developments have been less satisfactory, requiring level changes for transferring passengers at interchanges that have become much costlier to construct.

For rail, there have been broadly three types of development:

- Those initiated by London Transport/TfL – and the seminal (but very rapidly carried out) Central London Rail Study of 1988 (the clue to much of what followed in terms of the specification of Crossrails 1 and 2 is in the word *central*)
- Projects designed to get more out of existing infrastructure, and London underground has now built an excellent track record in increasing capacity with higher service frequencies, alongside station by station measures to increase access/interchange flow capacities; also in this category would be the London Overground
- Other rail developments not initiated by London Transport/TfL – and these have included the DLR, Croydon Tramlink, the Croyley Link (now re-labelled the Metropolitan Line Extension). Interestingly, these are schemes largely outside central London. The Jubilee Line and Northern Line Extensions were both initiated by property developers. But all of these projects have ended up under TfL's overall management (including in most cases through the construction phase).

There has been no successor to the Central London Rail Study carried out 27 years ago, nor any comprehensive plan for developing London's rail network across inner and outer London. So there is a planning vacuum around Crossrail 2.

The sequence of events with Crossrail 1 implementation is relevant. It had been selected as the priority from the various Central London Rail Study (CLRS) schemes

but its Parliamentary Bill was thrown out in 1994. A subsequent study led by the Strategic Rail Authority in 2001 examined the need for investment (The London East West Study (LEWS)), and this studied a wide range of options and considered the needs of freight traffic, for example, as well as passengers. No equivalent study has been carried out for Crossrail 2; its selection is based on the now ancient CLRS study, where it came in second. Crossrail 1 was revised following LEWS to include an alignment serving Whitechapel and Canary Wharf – and the earlier objections from London Borough of Tower Hamlets that had stopped the 1994 Bill did not recur.

In terms of the road network, there has been a continuing erosion of network capacity for vehicles attributable to local demand management measures, and better provision for cycling and pedestrians. Vehicular travel speeds have declined in all parts of London over the last ten years as a result, even with static and slightly falling traffic volumes.

The review led by Deputy Mayor Isabel Dedring in 2013 identified the potential role of tunnelled roads and a possible inner ring scheme was published in May 2014¹. Because of the high levels of suppressed demand, any increases in road network capability for vehicular traffic will be self-defeating as a means to tackle road congestion; road user charges or tolls would need to be considered; price levels would have to be punitive. In short, it is not realistic to plan on expanding the road network to add general vehicular traffic capacity. On the other hand, there is strong demand for additional space to be set aside as public realm; there is a very critical need to achieve gains in air quality (so pedestrianisation of Oxford Street should be a priority, especially given the access gains that Crossrail 1 brings²); and there is a need to accommodate buses, service vehicles and emergency services with a much reduced risk of delay from congestion.

This suggests that tunnelled road schemes with these wider user objectives should be developed – but explicitly not as a means to increase general road traffic capacity.

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The problems of success – a prospering city, with economic strengths not just in financial/business/professional services, but also in creative/digital media and culture, in tourism, retail, in Government, in law/justice, in research and learning.

¹ <https://tfl.gov.uk/corporate/publications-and-reports/roads-task-force>

² See West End Commission, final report April 2013 www.westendcommission.com/Report.html

With high population growth, in both London and the surrounding regions (Southeast and East of England), there are challenges to provide sufficient new housing and associated social infrastructure (schools, parks/leisure facilities, hospitals) at affordable prices.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

Road investment needs to be directed towards meeting the needs of many distinct user groups: pedestrians, cyclists, buses/trams, servicing vehicles (including to construction sites) and emergency vehicles.

Rail investment needs to address the capacity challenges identified by Network Rail, including on several major radial lines³; efficiently to cross-link radial lines; to create a limited set of orbital rail routes that convert the radial routes into a part of a broader network capability; to respond to major development opportunities as they arise in the manner of JLE and NLE; to continue the programme of station capacity enhancement and LU line capacity upgrades; to respond to the access needs of major long distance terminals (HSR and airports); to provide for cross London railfreight and railfreight terminals.

- *How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?*

Against the 5 criteria identified above and by reference to business case and benefit:cost performance.

- *What might their potential impact be on employment, productivity and housing supply in London and the southeast?*

These investments are hugely important to employment and productivity. They might have little useful impact on housing supply/prices: transport enhancement tends to drive up property values and hence prices. But planned in conjunction with new measures to achieve residential densification and to serve large scale new

³ London and South East Route Utilisation Study 2011 see [www.networkrail.co.uk/.../route%20Utilisation%20strategies/.../london%](http://www.networkrail.co.uk/.../route%20Utilisation%20strategies/.../london%20) and www.networkrail.co.uk/...studies/london-and-south-east-market-study.pdf of 2013.

developments with 'transit-oriented development', rail investments could be made supportive of the housing supply objective too.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

The *benefits* of Crossrail 2 can be increased by:

1. Ensuring it provides sufficient capacity relief to major national rail routes so that other parallel major rail investments are not needed
2. Cross-linking its branches, such as Kingston – Epsom (which will otherwise be under-utilised with perhaps only 4 trains/h) to provide part of the orbital network (and failing to do this may well preclude creating a highly valuable orbital rail system)
3. Increasing planned service frequencies to 40 trains/h. This requires full automation, but this is the norm with new metro systems.

To expand on the first point. Crossrail 2, suitably adapted, could provide for transformations of the South West and East Coast Main Lines (SWML and ECML). The four track route into Waterloo (SWML) has sufficient demand (peak passengers routinely stand for over 60 miles) to require one pair of tracks to offer a non-stop route into Waterloo, with the other pair of tracks accommodating limited stop outer suburban services to provide high frequency interchange at the key nodes along the route in London (Wimbledon, Clapham Junction and Vauxhall). The current Crossrail 2 plan will unfortunately preclude this by leaving a need also to serve Earlsfield – a location that needs to be served by Crossrail 2 running on its own tracks. It would still be possible to serve Balham and relieve the Northern Line, but this should be a separate branch, suitably extended to serve the Streatham area.

At the other end of the route, the ECML will be paralleled by Crossrail 2, but not over sufficient distance to obviate the need to operate duplicate suburban services, wasting line capacity and precluding the expansion of longer distance (and high-speed services) on the ECML corridor without building a new pair of tracks (in the style of the HS2 approach to central London). Crossrail 2 should be extended (on its own tracks) to Welwyn Garden City accordingly. A second branch should run eastwards to serve the opportunity areas along the Thames.

Costs can be reduced by adopting technology closer to that used on DLR, allowing where needed, for greater flexibility of alignment, and with 40 trains/h, potentially somewhat shorter trains and therefore lower cost stations (a combination that also

reduces the risk of station overcrowding and the need to provide for it). Unnecessary or unwanted stations (such as at Chelsea) can be avoided and faster journey times and shorter (lower cost) alignments can be selected (at least in this instance).

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- *What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?*
- *What innovative funding mechanisms could be considered to support delivery of key schemes?*

A levy should be placed on all property in London, residential and business, to fund transport investment. Together this should provide at least 33% of the funding of projects like Crossrail 2 – with extensions into the line catchments in surrounding shire counties. Another third should come from operating profit (that is revenues less operating costs). Ticket prices will have to remain high – partly because of demand management issues – but more discounting should be available to younger residents who cannot afford the fares, from 18 to 25/30 and maybe even 40 years age groups. Government should fund the balancing third: its returns will be huge (including in enhanced tax revenues).

For road schemes, the Congestion Charge needs to be overhauled and extended to the M25. In London the road system is the one transport network which does not cover its routine costs. Use of the network by the innovative forms of service providers such as Uber and car clubs needs to be addressed separately from the regular pay-as-you go/daily tariff.

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

A useful source on this subject is now a little out of date but remains reasonably comprehensive.⁴ Some cities (e.g. Oslo) have since used road tolling to fund public transport schemes.

⁴ Transport 2000 (now CBT): Financing Public Transport: How does Britain Compare? 1992

Response to the National Infrastructure Commission Call for Evidence on London's transport needs from the Royal Borough of Greenwich Conservative Council Group

January 2016

1. Executive summary

- 1.1. The Greenwich Conservative Council Group welcomes this opportunity to contribute evidence to the National Infrastructure Commission's Call for Evidence on London's transport needs.
- 1.2. We have responded to the questions laid out in the call for evidence from our perspective as a Group of (opposition) councillors representing residents in the Royal Borough of Greenwich. Our response naturally focuses on South East London.
- 1.3. Any queries about this response should be directed to Councillor Matt Clare, Greenwich Conservatives Transport Spokesperson at [email redacted]

2. Question (1): What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

- 2.1. Over the next 10 years alone 80,000 new homes will be built in the 5 most South Easterly London boroughs.
- 2.2. Large-scale building will continue beyond the current 10 year targets of 80,000 new homes. Moreover significant home building is underway further out from London on already crowded commuter routes which are shared by residents of the five South East London boroughs.
- 2.3. With efforts to shift commuters from car to public transport the already overcrowded Southeastern trains commuter routes from Kent via South East London will not cope with increased passenger volumes unless significant capacity is added and alternatives such as cycling and buses maximised.

Road capacity in Southeast London is considerably less than in North London and already overcrowded. The Silvertown tunnel, of which we are supportive in principle, will go some way to address this. However clearly the roads are at capacity with there being no option to build further. This further reinforces the arguments in favour of significant improvements to public transport in South East London.

3. Question (2): What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

3.1. **The Bakerloo Line extension from Elephant & Castle to New Cross Gate, Lewisham and onward to Catford & Hayes via an existing National Rail line is essential** to help address the challenges described above.

3.2. The Bakerloo line extension will provide

- an additional high frequency public transport route from very high population growth areas such as Catford, Lewisham and the Old Kent Road to Central London
- a freeing up of line capacity on already overcrowded regional train routes from Dartford via Sidcup and Bexleyheath as well as from Orpington on the Lewisham to London terminii stretch
- a high frequency 'turn up and go' tube service to central London from Hayes, Catford and beyond to replace infrequent trains

3.3. The Bakerloo line extension will also deliver excellent value for money. At approx £2.5bn the proposed Bakerloo Line extension represents only around 15% of the cost of Crossrail 2, but will serve heavily populated relatively central London areas not currently on the tube/train at all (e.g Old Kent Road, Camberwell)

3.4. It is worth noting that this extension was first considered in the 1930s and again in the 1950s and 1970s, long before the volumes of traffic and commuting by train we see today. Due to its currently very central terminus the Bakerloo line is seemingly the only rail line in London which has the capacity to cope with an extension like that proposed above.

3.5. **We also support the proposed London Overground extension from Barking Riverside to Abbey Wood.**

3.6. The London Overground is being extended from Barking to Barking Riverside. Continuing south eastwards to include Thamesmead and Abbey Wood would

bring significant further employment opportunities to residents on both sides of the river.

- 3.7. It is worth noting that with its 50,000 residents Thamesmead is the largest area of London to not be served by tube or rail at all.
- 3.8. **We believe that cycling infrastructure must see significant investment in South East London.**
- 3.9. South East London remains under served by public transport compared to other parts of London. Unfortunately commuting by bike is not yet as attractive an option in South East London as it is from other areas of London which are a comparable distance from the centre such as Newham, Wandsworth or Merton. This is largely due to a lack of safe segregated cycling routes.
- 3.10. The Old Kent Road, Central Lewisham and Lee High Road in particular are considered dangerous and a barrier to many people commuting to work on a bike.
- 3.11. The approved CS4 and CS5 routes will go along way to achieving this. However further extensions outwards should be considered (for example, to Plumstead and Eltham) as well as additional alternative routes. These should only continue with the consent of residents, including all types of road users, and so proper consultation with the public is essential.
- 3.12. **Crucially, the highly successful TfL/Santander Cycle Hire Scheme must be extended into South East London** in the same way that it has been to East, West and South West London all of which already enjoy far better public transport connections.
- 3.13. Extending TfL cycle hire into South East London will give more resilience to the transport network and reduce reliance on cars and buses for shorter journeys.
- 3.14. Greenwich Conservatives are already campaigning for an expansion of TfL cycle hire into Greenwich via the foot tunnels from Island Gardens, including lobbying the Labour administration of Greenwich Council to make a pro-active case to Transport for London, which it has so far failed to do.
- 3.15. It is estimated that a few docking stations could be delivered for around the cost of a brand-new double-decker bus. Contrast this with that bus which travels from point A to point B via predetermined stops and is only available at the point the bus finds itself on that route at any one time. Investing in Santander cycles gives docking stations and bikes which are available at scattered points and can be ridden at flexible times to any one of 750 docking points across London.

4. (Question 3): How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

4.1. Given the already overcrowded and inadequate public transport in South East London (See PTAL ratings) we strongly believe that the Bakerloo line extension must be prioritised. The Bakerloo line extension can be delivered for only around 15% of the cost of Crossrail 2.

5. (Question 4): What might their potential impact be on employment, productivity and housing supply in London and the southeast?

5.1. Each of the above three projects will bring residents of South East London (old and new) within reach of more employment opportunities.

5.2. Faster, more reliable train and tube journeys into central London will be key to London remaining productive. Already with current volumes of commuters Southeastern trains are frequently delayed resulting in regular productivity losses for London businesses.

Eurotunnel submission to the National Infrastructure Commission consultation – London

Eurotunnel welcomes the opportunity to respond to this consultation, having long been aware of the need to ensure that infrastructure projects in the UK are delivered rapidly in order to support economic growth.

Overview

Groupe Eurotunnel (GET) manages and operates the Channel Tunnel Fixed Link between Britain and France, providing the infrastructure for Eurotunnel's own Shuttle services, international freight and high speed passenger trains. Completed in 1994, the Tunnel was financed entirely from private sources at no cost to the taxpayer.

GET also operates GB Railfreight, as the British arm of its Europorte rail freight brand. Acquired by Europorte in 2010, the business operates a variety of services including bulk traffic, biomass, coal steel, petrochemicals and metals transportation. GB Railfreight prides itself on its innovative approach to railfreight which has seen it win a number of rail industry awards and earn the standing as Britain's most reliable freight operator.

Maintaining effective transport links throughout the UK is crucial to ensuring economic prosperity. This allows businesses in London to transport their products throughout Britain and beyond, and also ensures that the Capital is supplied with the goods it requires.

Response

As the operator of the Channel Tunnel, GET provides crucial infrastructure for the transport of goods to and from mainland Europe. The opening of the Channel Tunnel revolutionised the UK's accessibility to the European market, which can be reached faster and more reliably than at any time.

The UK economy directly benefits from the mature fixed link to mainland Europe. Key industry sectors have built import and export business models that are only viable because of the Tunnel. For example the automotive industry can transport time sensitive components; fish from Scotland and meat from Ireland can build key export markets across Europe. Prior to the Tunnel there was no economically sustainable business model to facilitate the UK's full participation in this trading revolution.

To support London's growth through more effective access to European markets, additional highways capacity crossing the Thames to the east of London is required. This can be delivered through the proposed Lower Thames Crossing which will support economic growth and release pressure on central London crossings such as the Blackwall Tunnel. In addition, new capacity for rail freight is required through Kent, to link businesses in London to the continental market, as set out below.

South East road highways capacity and Operation Stack

However, this summer saw access to the Tunnel limited by a combination of migrant incursions and striking ferry workers. Operation Stack was enforced for 28 days and during this time British manufacturers all over the country were placed under intense pressure. The goods transferred via the Tunnel tend to be high value components for the automotive, electronics, pharmaceutical industries, fresh produce and rapid courier services, and delays in their transportation result in large costs for business throughout the UK.

Although Operation Stack has not been in force since then, the events of the summer highlighted the need to increase the resilience of road networks in the South East. The road network in Kent is vital for connecting the south of England to the Capital. With a predicted increase in truck traffic of 30% in the next five years, there is a clear need for a solution to Operation Stack and additional capacity in Kent and the South East road network. In order to maximise economic growth across the country we must keep vehicles moving. This requires long term solutions such as: adding capacity to the M20; upgrading the A2 to motorway standard; providing additional capacity across the Thames through a new Lower Thames Crossing (as noted below); and consideration of modal shift to rail freight. These changes would ensure that products made throughout the UK are more likely to be successfully transported to Europe, than the current situation where Operation Stack is enforced.

This requires long term solutions such as adding capacity to the M20, upgrading the A2 to motorway standard and also consideration of modal shift to rail freight. These changes would ensure that products made in London can be successfully transported to Europe without costly delays, and businesses in London will receive the products they need to serve their customers.

Rail freight capacity

Another opportunity for addressing congestion on the roads in the South East and to ensure greater security for time sensitive deliveries would be for the Government to invest in the creation of greater rail freight capacity across the UK.

This will encourage a modal shift from road to rail, taking lorries off the road network, releasing capacity for other vehicles and increasing the reliability of those companies using rail freight for deliveries. There would also be well-documented environmental benefits delivered by this modal shift.

The Government has committed to deliver additional freight capacity, but action needs to be taken, in particular:

- Implementing and funding the proposed European Rail Freight Corridor from Europe to London to ensure swift rail access to foreign markets.
- Completing the Kent Gauge Study proposed by Network Rail and upgrading freight routes through the county which link the Channel Tunnel to London and the wider UK.
- Investigating and delivering improvements to the network beyond London, so that businesses in the Midlands and North of England benefit from rapid rail freight access to European markets and routes to the Capital. This includes identifying and delivering capacity improvements on key rail arteries such as the West Coast and East Coast Main Lines.

Lower Thames Crossing

Finally, addressing capacity on crossings across the Thames through the creation of a Lower Thames Crossing is also crucial for ensuring prosperity. A new crossing would relieve congestion on the routes from the South East into London, allowing businesses to transport their produce in good time and smoothing traffic flows into the Channel Tunnel.

Upgrading the local Kent road network, increasing rail freight capacity, and constructing a Lower Thames Crossing would benefit London businesses by improving their ability to connect to mainland Europe and reducing delays which cause their products to lose value. Additionally, an improved road network would reinvigorate local development in the South East by creating jobs in the area, and stimulating investment as businesses become more confident that there is a reliable transportation network.

The Conservative Group
London Borough of Hammersmith & Fulham

Via email

5 January 2016

Dear Ms Dix,

Response to the Crossrail 2 consultation

As the Conservative Councillors for the London Borough of Hammersmith & Fulham, we are writing in support of a Crossrail 2 interchange at Imperial Wharf.

Last month, the TfL Commissioner, Mike Brown, assured Greg Hands MP that Imperial Wharf is “being seriously considered” as an alternative station site. This new approach is encouraging. We believe that Imperial Wharf would serve more commuters, support more new jobs and homes, offer better value and – perhaps as importantly – gain support across our borough and west Chelsea.

Imperial Wharf has significant advantages over the current plans for a station at the eastern end of the King’s Road:

Interchange – Imperial Wharf would form the main Crossrail 2 interchange with the West London Line, reducing journey times for passengers. Without a separate interchange, Clapham Junction is likely to face severe station capacity problems, because it will also handle new demand from dozens of mainline routes. The interchange would also remove pressure on Overground services at the existing Imperial Wharf station, while relieving pressure on the District Line at West Brompton, Fulham Broadway and Parson’s Green.

Passengers – based on its current catchment area alone, more commuters would use a Crossrail 2 station at Imperial Wharf. This number rises when new development is anticipated. It rises again when new bus routes in south Fulham are considered, as there would be substantial demand for improved links under Crossrail. When passengers transferring from the Overground are added, the commuter case for Imperial Wharf becomes overwhelming.

Alignment – a natural alignment from Imperial Wharf (through Clapham Junction) to Balham would not involve tight curves. Changing the orientation of the track through Clapham Junction would therefore result in faster journeys, an equivalent track length and lower maintenance costs than under the current plans. We also welcome TfL’s acknowledgement that the foundations of the riverfront buildings are navigable. There is no engineering barrier to a Crossrail 2 station at Imperial Wharf.

Cost – land values around Imperial Wharf are cheaper, with the ability to redevelop a brownfield site to offset the cost of the station. The Lots Road Car Pound site would allow a significant capital receipt from new housing, as well as a station entrance in Chelsea. There is also the possibility of s.106 contributions from neighbouring sites that are due for redevelopment. Together, these factors suggest a significantly lower cost for an Imperial Wharf interchange than building a King's Road station with no associated redevelopment.

Olympia – District Line services to Olympia have been a recurrent issue for residents, for the exhibition halls, and for solving the bottleneck at Earls Court. A Crossrail 2 interchange just two Overground stops away at Imperial Wharf would finally provide a solution, particularly when combined with more frequent Overground services. Likewise, Imperial Wharf would provide a real alternative for many more passengers at West Brompton, which faces growing pressure from new development.

Regeneration – a key aim of the Crossrail 2 project is to unlock more jobs and homes, assisting in London's regeneration. There are several major redevelopment sites around Imperial Wharf, all of which are poorly served in terms of public transport links to central London. This has hampered their progress. A Crossrail 2 interchange would spur substantial investment and create new employment around the station. By contrast, no significant development sites in Chelsea would be unlocked through the current plans.

Support – unlike the plans for a King's Road station, there is unequivocal local support for bringing Crossrail 2 to Imperial Wharf. It would benefit thousands of commuters in Fulham, both directly and by relieving pressure on the District Line. It would still benefit thousands of commuters in Chelsea, with greater benefits for the poorly connected areas around World's End and Lots Road. It would also offer benefits along the rest of the West London Line. Local residents consistently tell us that they want Crossrail 2 to serve our area.

An Imperial Wharf interchange is compatible with the original conception of a Chelsea-to-Hackney line, which for many years included safeguarded land in Fulham. It would allow a station entrance in Chelsea, on Lots Road, and others serving Chelsea Creek, Chelsea Harbour and Imperial Wharf. At the same time, it would enable Crossrail 2 to be cheaper, faster, serve more passengers and tackle overcrowding at multiple stations, while delivering the regeneration always intended.

Given these advantages, it was frustrating to see many inaccuracies and omissions in the report provided to Greg Hands MP in October. We hope that you will now commit to undertaking a proper technical study of the Imperial Wharf option, which will provide a credible basis for assessing passenger numbers, cost, regeneration potential, journey times, station alignments, tunnel routes, shaft locations, Overground usage and the impact on other stations and lines.

In administration, we urged the case for an Imperial Wharf interchange during TfL's consultation process in 2013. Given the new Commissioner's openness to rethinking the plans, we strongly urge the case again. It is a far better option than the King's Road.

We would welcome an opportunity to meet in person to discuss an Imperial Wharf station on behalf of our residents.

Yours sincerely,

Executive Summary

Heathrow Airport Limited congratulates the Chancellor on establishing a much needed and independent National Infrastructure Commission to provide unbiased assessments of the UK's long-term infrastructure needs. Heathrow also looks forward to the Commission's commitment to monitor the Government and industry's progress in meeting these needs, because it is critical national interests are not thwarted by local political interests.

As the European Commission noted in its recent Aviation Strategy, connectivity and infrastructure – and as Heathrow's submission will outline, strategic connectivity to airports – are critical to the UK because 'studies show that the better a city, region or country is connected by air to other destinations in Europe and other parts of the world, the more growth can be generated.' The European Commission's new Strategy also recognises aviation and airports as 'strong drivers of economic growth, jobs, trade and mobility for the European Union' and hence why improving connectivity has been listed as one of the Commission's three key priorities.

The fact that connectivity has been outlined as a priority in the European Commission's new Aviation Strategy also validates the important role connectivity and infrastructure play in the UK economy and why the independent National Infrastructure Commission's work is so important. The Commission should note that it is not just city-to-city connectivity that could address connectivity weaknesses, but also strategic city-to-airport connectivity.

For example, limited and indirect rail and air links between the North and Heathrow Airport are holding back the growth of northern city regions because 'the world's economic centre of gravity has shifted towards Asia.'¹ Heathrow offers more direct and frequent flights to Asia because it is a hub airport. As a hub, Heathrow is different to other UK airports, because it can pool international, continental, domestic and local demand for leisure and business passengers as well as air freight, making direct flights to more cities around the world, particularly emerging markets, more commercially viable for airlines. It is critical that northern cities are well connected to Asia and the most viable way to do this for the UK economy is with better connectivity to Heathrow Airport.

That said the UK's regional airports still play an important role in connecting regional city regions, but they play a different role to Heathrow. For example, this submission demonstrates how as a hub, Heathrow plays a significant and different role to other airports in the country's freight connectivity. Heathrow is the most important freight airport in the UK, moving more cargo than all other UK airports combined (CAA, UK Airport Freight Data, 1990 – 2014²). This confirms the importance of connectivity (rail and domestic air links) to Heathrow for exporters in the North and indeed around the country.

While the Commission is not looking at airport capacity, it is important that the Commission notes the added benefits to the UK and the freight community when prioritising infrastructure projects and the added benefits that connectivity can bring.

As mentioned previously, with the global shift to Asia, London – and the UK's – status and its continuing success as a global centre for business is critically dependent on the quality of its international connectivity, as well as its local transport infrastructure. London is expected to see major population growth, but it is in competition with other cities around the world, so investing in London's transport infrastructure and connectivity to its only hub airport is key to maintaining its competitive edge and status as a leading global city for its residents, businesses, international investors, exporters, students and tourists.

¹ The European Commission, Aviation Strategy for Europe, December 2015

² <http://www.caa.co.uk/Data-and-analysis/UK-aviation-market/Airports/Datasets/UK-Airport-data/Airport-data-1990-onwards/>

About Heathrow

Heathrow Airport Limited owns and runs Heathrow Airport – the UK’s only hub airport. In 2014 73.4 million passengers and 1.50 million tonnes of freight passed through the airport – worth £101bn in value, making Heathrow the UK’s biggest port by value.

Heathrow is one of the UK’s largest transport hubs with the UK’s only dedicated non-stop express airport rail link, free travel zone, the UK’s busiest bus and coach station and the only airport served by London Underground, with four stations. Over the last 20 years passenger numbers have risen by almost 80% and yet airport related road traffic has remained broadly static. The number of passengers using public transport every year has nearly doubled from 10 million to 19 million and the proportion of our colleagues driving to work alone has fallen from 8 in 10 to just 5 in 10.

Introduction

Heathrow is submitting evidence to the National Infrastructure Commission’s call for evidence because we believe there is opportunity for the Government to prioritise certain infrastructure projects, particularly rail and domestic air links to the UK’s only hub airport – Heathrow – to benefit passengers, businesses, the environment and the UK’s economy not only in the north, but also for the rest of the UK and Greater London.

While this call for evidence is not looking at airport capacity or air quality issues, **strategic and sustainable connectivity to airports** – particularly the UK’s only hub airport, Heathrow – are areas of infrastructure that we believe the Government should prioritise to improve all of the UK’s connectivity, economic growth and maintaining London’s status as a leading global city.

1. Connecting northern cities

1. *To what extent are weaknesses in transport connectivity holding back northern city regions (specifically in terms of jobs, enterprise creation and growth, and housing)?*

Limited and indirect rail and air links between the North and Heathrow Airport are holding back the growth of northern city regions because ‘the world’s economic centre of gravity has shifted towards Asia.’³ Heathrow offers more direct and frequent flights to Asia because it is a hub airport. As a hub, Heathrow is different to other UK airports, because it can pool international, continental, domestic and local demand for leisure and business passengers as well as air freight, making direct flights to more cities around the world, particularly emerging markets, more commercially viable for airlines. It is critical that northern cities are well connected to Asia and the most viable way to do this is with better connectivity to Heathrow Airport.

While the National Infrastructure Commission is not looking at airport capacity, it is important the Commission notes the GDP and job benefits (outlined below) that an expanded Heathrow could bring northern city regions and the additional benefits that links to other infrastructure projects could also bring the North, for example linking HS2 and Crossrail 2 to Heathrow for northern passengers.

The independent Airports Commission produced an assessment of the economic benefits that would arise from airport expansion in terms of jobs and GDP (in Net Present Value). It also produced a broad breakdown of where in the UK the overall GDP increase effects will arise. These are presented for three broad regions (London & South East; Rest of England; and Rest of UK) for the scenario it defines as “Assessment of Need.”

Table 1: Present Value of regional real GDP impacts – Assessment of Need Scenario⁴

³ The European Commission, Aviation Strategy for Europe, December 2015

⁴ Source: Airports Commission, “Economy: Wider Impacts Assessment” Tables 18 & 36

Written evidence submitted by Heathrow Airport Limited
National Infrastructure Commission: call for evidence

	Heathrow
London & South East	39.83%
Rest of England	43.78%
Rest of UK	16.39%

Source: Airports Commission, "Economy: Wider Impacts Assessment" Tables 18 & 36

Heathrow then commissioned Quod to do a further breakdown of the Airports Commission's work to UK regions and converted the results to jobs based on GDP per worker. The Airports Commission estimates that the Heathrow North West Runway option would create an additional 179,800 jobs by 2050 under the Assessment of Need scenario. The estimated regional breakdown is as follows:

Table 2: Regional breakdown of jobs based on GDP per worker, controlled to AC estimates

	Heathrow	Gatwick
London	38,500	9,300
South East	33,200	8,000
London & South East	71,700	17,200
Yorkshire & Humber	11,300	3,500
North West	15,300	4,800
North East	5,100	1,600
East	12,900	4,100
East Midlands	9,800	3,100
West Midlands	12,000	3,800
South West	12,300	3,900
Rest of England	78,800	24,800
Scotland	16,100	4,100
Wales	8,400	2,200
Northern Ireland	5,000	1,300
Rest of UK	29,500	7,600
TOTAL	179,800	49,600

This table demonstrates the job benefits Heathrow expansion will bring northern cities and the significantly more jobs Heathrow expansion will bring the North compared to Gatwick. The difference in job numbers between expanding Heathrow versus Gatwick is attributed to the increase in manufacturing jobs and Heathrow is one of the UK's most significant ports, moving the most freight by value in the UK. Heathrow is also the most important freight airport in the UK, moving more cargo than all other UK airports combined. In 2014 Heathrow moved nearly 1.5 million tonnes; followed by East Midlands International at 277,413 tonnes; Stansted 204,725 tonnes; Manchester 93,466 tonnes and Gatwick moving 88,508 tonnes. In terms of other northern cities, in 2014, 5,119 tonnes moved through Birmingham; 4,450 tonnes through Newcastle and 236 tonnes at Liverpool (CAA, UK Airport Freight Data, 1990 – 2014⁵, Refer to APPENDICES A & B). This demonstrates the importance of connectivity (rail and domestic flight links) to Heathrow for exporters in the North and indeed around the country.

⁵ <http://www.caa.co.uk/Data-and-analysis/UK-aviation-market/Airports/Datasets/UK-Airport-data/Airport-data-1990-onwards/>

Written evidence submitted by Heathrow Airport Limited

National Infrastructure Commission: call for evidence

Again, while the Commission is not looking at airport capacity, it is important that the Commission notes the added benefits to the freight community when prioritising infrastructure projects, such as rail links to Heathrow, which generally brings significantly more benefits than any other airport.

HS2 provided a unique opportunity to deliver a properly integrated transport system with a direct connection to Heathrow. This could have been key to delivering benefits for passengers and achieving Government objectives for more sustainable travel, improving domestic and international connectivity, economic growth and carbon reduction. The Government initially supported a direct link to Heathrow on the basis that it would:

- a. Significantly enhance its accessibility by rail from the Midlands and the North;
- b. Provide new opportunities for growth and investment in those regions;
- c. Create a multi-modal transport 'hub' at the airport;
- d. Ensure that HS2 passengers would not have to change trains to access Heathrow;
- e. Incentivise further surface access investment at Heathrow; and
- f. Yield benefits right across the country.

However, the Government subsequently abandoned the proposals for a spur to Heathrow in early 2015, primarily on the basis that this was not considered necessary to support Heathrow's expansion. This unexpected decision represented a significant blow to regions in the Midlands and the North that could have benefited from direct rail connectivity to Heathrow, particularly where many domestic/ regional air connections have been lost. This is an example of how northern city regions will be disadvantaged through our inability to properly plan our major high speed rail network, despite some very clear strategic benefits. In the absence of a spur, a high quality interchange at Old Oak Common is essential.

Heathrow is currently the best connected airport by road in England. Based on ONS connectivity work, over 7m people have Heathrow as the airport with the shortest journey time by road. For Birmingham, London City and Manchester this figure is below 5.5m. For public transport, Heathrow is the airport with the quickest journey time for around 5.8m people. As you can see, there is a gap of more than a million people for whom Heathrow is the shortest journey by car, but not by public transport. Making public transport to Heathrow a more attractive option, with journey times competitive in comparison to those by private transport needs to be addressed so that passengers from all over the UK have different options available for accessing Heathrow.

The priority is for schemes to provide direct rail connectivity through the delivery of Crossrail, Western Rail Link and Southern Rail Access because 50% of surface access journeys to Heathrow have origin/destinations in London and a further 25% in the South East. However, over a million passengers a year currently travel from Scotland, Yorkshire & the Humber, North East and North West England via ground transportation to Heathrow. Those travelling by rail outside of London need to travel to Paddington, by London Underground or make use of one of the rail-air coach services, so Heathrow connectivity can still be improved for the rest of the UK. If the Government is serious about improving the growth of our regional cities, improving traffic congestion and reducing vehicle emissions, these passengers and their locations need to be served via key rail interchanges so that public transport options are at least as attractive to them as private transport options.

For example, York has excellent connectivity with London via East Coast Main Line and as a result the journey via rail to Heathrow is around 40 minutes shorter than the equivalent road journey. Derby, on the other hand, has a road journey which is almost half as short as the rail option (150 mins by car vs. 276 mins by rail). 54% of passengers arriving at Heathrow from York have done so by rail or tube, for Derby it is only 21%, which highlights the effect good rail links have on passengers' transport choice.

Only Leeds/Bradford, Manchester, Newcastle and Liverpool serve more direct passengers from The North than Heathrow does each year. Currently, twice as many passengers reach Heathrow by public transport from Scotland, Yorkshire & the Humber, North East and North West England than Gatwick (in 2014 657k vs. 327k respectively) more than Newcastle (504k in 2013) and almost as many as Liverpool (688k in

Written evidence submitted by Heathrow Airport Limited

National Infrastructure Commission: call for evidence

2014). In fact only Manchester can boast significantly more passengers from the North arriving via public transport (3m in 2014).

The Piccadilly Line upgrade will increase line capacity by 60% through a new signaling system and trains allowing faster and more frequent services. While delivery timescales are yet to be finalised, this could provide up to 18 trains per hour serving Heathrow, compared to 12 trains per hour currently. This will improve the offering for passengers arriving at Heathrow from northern cities via London. Western Rail Link to Heathrow by National Rail's Control Period 6 will provide yet more integration to cities like Newcastle, Derby, Sheffield and Leeds via Reading.

The new HS2 interchange at Old Oak Common will be served by frequent Heathrow Express and Crossrail services, providing important connectivity to key cities in the Midlands and the North. This will transform Heathrow journey times for the North, bringing Birmingham within an hour of Heathrow and both Manchester and Leeds within around 90 minutes. This will make rail journey times to the airport significantly better than those by road and also avoids multiple interchanges through London by rail for passengers traveling from the North.

With these additional rail services in place, the number of trains per hour serving Heathrow would double by 2030 to 36 trains per hour with capacity increasing from around 5,000 seats per hour to almost 13,000. Improving rail connectivity to Heathrow will grow the number of people and businesses that can access Heathrow and its direct global connections. Heathrow's surface access strategy sees substantial increases in the number of people who could reach the airport by public transport. Shifting airport passengers from private cars to public transport will also free up capacity on the highway network and provide increased demand on public transport services throughout the day.

The Airports Commission concluded that better rail connections could bring 10 million people within three hours of the airport by public transport. In many locations this will mean that public transport is directly comparable or better than the alternative journey by road helping support the Government's objectives on modal shift and reducing road congestion and emissions for the UK.

Some of the key journey time savings for northern cities is summarised in the table below:

Station	2013		2032	
	Journey time	Interchanges	Journey time	Interchanges
York	3 hours 03 minutes	2	1 hour 52 minutes	1
Newcastle	4 hours 01 minutes	3	2 hour 54 minutes	2
Hull	3 hours 46 minutes	2	2 hour 51 minutes	1
Leeds	3 hours 30 minutes	2	1 hour 48 minutes	1
Liverpool	3 hours 29 minutes	2	1 hour 51 minutes	1
Manchester	3 hours 16 minutes	2	1 hour 28 minutes	1
Sheffield	3 hours 17 minutes	2	1 hour 39 minutes	1

These cities alone represent almost 500,000 pa direct passengers accessing Heathrow via ground transport today.

2. *What cost-effective infrastructure investments in city-to-city connectivity could address these weaknesses? We are interested in all modes of transport.*

The Commission should note that it is not just city-to-city connectivity that could address these weaknesses, but also city-to-airport connectivity. Strategic connectivity to airports is important because as recognised in the European Commission's new European Aviation Strategy 'studies show that the better a city, region or country is connected by air to other destinations in Europe and other parts of the world, the more growth can be generated.' The Commission's new Strategy also recognises aviation and airports as 'strong drivers of economic growth, jobs, trade and mobility for the European Union' – and hence has listed 'tackling limits to growth in the air and on the ground by reducing capacity constraints and improving efficiency and connectivity' as one of its three key priorities. The surface access network connects people and freight to Heathrow, the UK's only hub airport. It generates economic growth by helping UK businesses connect with existing and emerging markets. Research shows there is a strong link between a passenger's surface access experience⁶ and their overall satisfaction with Heathrow. It is also a main influence on their choice of airport (CAA passenger choice report from 2011 pg. 20-21)⁷. Since passengers value reliable, convenient, direct and frequent services, we have to make sure that Heathrow's surface access meets the needs and expectations of its users.

3. *Which city-to-city corridor(s) should be the priority for early phases of investment?*

In terms of city-to-city connectivity, it is in the Government's gift to review and implement Public Service Obligations and protect domestic UK air links.

That said, connections to London Heathrow should be prioritised because Heathrow is one of the UK's most significant ports, moving the most freight by value in the UK. Heathrow is also the most important freight airport in the UK, moving more cargo than all other UK airports combined (CAA, UK Airport Freight Data, 1990 – 2014⁸, Refer to APPENDICES A & B).

4. *What are the key international connectivity needs likely to be in the next 20-30 years in the north of England (with a focus on ports and airports)? What is the most effective way to meet these needs, and what constraints on delivery are anticipated?*

One of the key international connectivity needs in the next 20-30 years in the North, which was recognised in the European Commission's recently launched European Aviation Strategy is 'the shift of the world's economic centre of gravity towards the East, notably Asia'⁹ and how the North will connect to the East. As outlined in our response to Question 1, Heathrow offers more direct and frequent flights to Asia because it is a hub airport and as a hub airport, Heathrow is different to other UK airports, because it can pool international, continental, domestic and local demand for leisure and business passengers as well as air freight, making direct flights to more cities around the world, particularly emerging markets, more commercially viable for airlines. Therefore with the global shift to the East, it is critical that northern cities are well connected to Asia and the most commercially viable way to do this to benefit the UK economy is through better connectivity to Heathrow airport.

That said the UK's regional airports play an important role in connecting regional city regions, but they play a different role to Heathrow. Regional airports have capacity and can provide services where there is direct demand. Otherwise access to a hub airport by surface transport or air is critical to satisfy the region's complete connectivity needs. Therefore surface access to airports and to Heathrow via air and rail are the most effective ways to meet future connectivity needs.

2. London's transport infrastructure

1. *What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?*

As mentioned in section 1, with the global shift to Asia, London's status and its continuing success as a global centre for business is critically dependent on the quality of its international connectivity, as well as its local transport infrastructure. London is expected to see major population growth, but it is in competition with other cities around the world, so investing in London's transport infrastructure and connectivity is key to maintaining its competitive edge and status as a leading global city for its residents, businesses, international investors, exporters, students and tourists.

Demand for connectivity to Heathrow and the capacity of the UK's only hub airport are only going to increase with London's growing population. According to the Greater London Authority, London's population is currently around 8.6m people. The middle estimates for the population in 2050 are around 11m. With over 14m people living in the London commuter belt area, it is essential that people who wish to work and live in London are well connected to all parts of the capital, the South East England, the UK and to the rest of the world.

Heathrow airport obviously plays a significant role in connecting London to the world and the world to London, but it is also a major employer and driver of job creation across the capital. For many local commuters Heathrow is not at the end of the Piccadilly Line, it is at the start and enables them to access London and the associated job market. Similarly, Heathrow Connect and in the future Crossrail will play an important role in empowering airport related workers to make public transport journeys from West London. The Office of National Statistics work on Travel To Work Areas based on the 2011 census has shown that Heathrow and Slough were designated as a separate TTWA, rather than being spread between London and Thames Valley areas. This is against a trend of these areas growing and swallowing up areas due to more concentrated economic activity and a trend to longer commutes to work over the previous decade.

2. *What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?*

- *How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?*
- *What might their potential impact be on employment, productivity and housing supply in London and the southeast?*

One of the strategic options for future investment in large-scale transport infrastructure improvements in London is in improving Heathrow's connectivity to the wider rail network to ensure that London and the wider South East can benefit from and fulfil Heathrow's global hub route network, taking advantage of the interchange opportunities provided at Heathrow.

The key rail priorities for Heathrow are:

- Crossrail
- Western Rail Access
- Southern Rail Access
- Piccadilly Line upgrade
- HS2

Investment in rail to Heathrow is supported by Network Rail's 2013 London & South East Market Study, which notes how good rail connectivity to airports is important in supporting economic growth, productivity and social mobility and plays a key role in providing better access to markets,

national and international destinations, business and leisure opportunities, and to jobs. It confirms that integrating new and improved rail services with other transport modes at major airports is key to delivering sustainable travel opportunities and improving overall connectivity. The study recommends that rail services should provide for the growing demand to access airports by rail, with fast, convenient and reliable rail access to central London a priority for London's airports but direct access to non-London core economic centres both long-distance and within the London and South East area increasingly important.

In the future Heathrow will provide direct terminal access to passengers from every mode of transport. They will be connected to the Underground network and have fast dedicated rail services to London provided by Heathrow Express. In 2019 Crossrail will link Heathrow to the City, Canary Wharf and East London. Western Rail Access will provide fast direct services to the West and South Wales. Southern Rail Access will connect Heathrow to Waterloo and the South and South-West mainlines. In 2026 the new HS2 rail line will provide fast access to Heathrow from the Midlands and the North by 2030.

The transport improvements already committed plus those planned can transform Heathrow into a fully integrated national transport hub that offers connectivity benefits for the local area and the rest of the UK. Heathrow will be a vital component of the national transport system and provide new direct transport links for local communities.

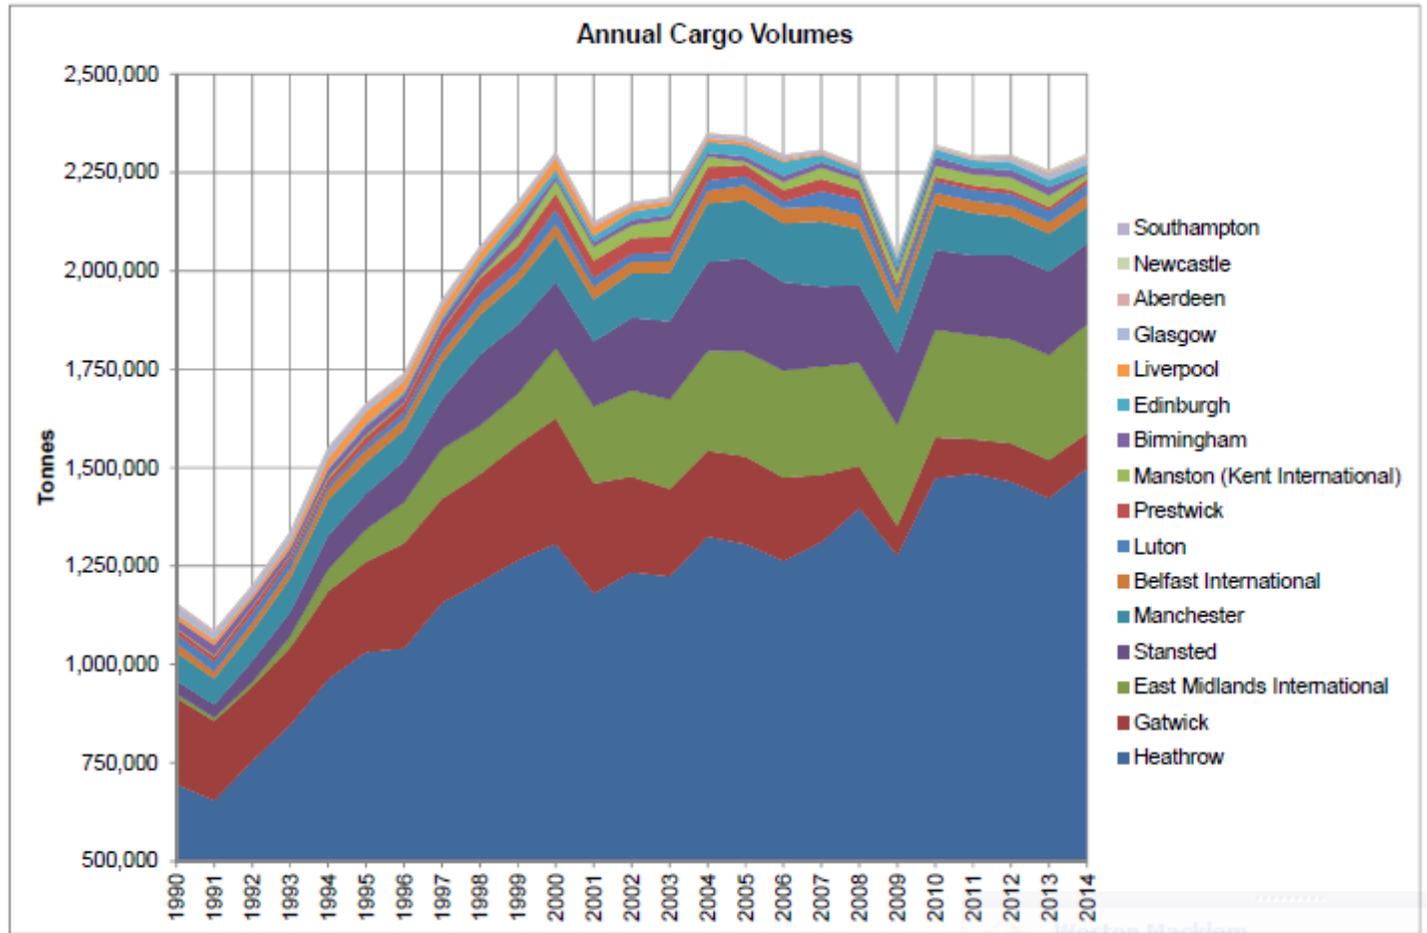

Increasing the modal shift onto public transport is also another priority for Heathrow. Heathrow's public transport improvements will increase transport resilience and give passengers, colleagues and members of the public choice. This is why we believe that projects like Crossrail, Western Rail Link and Southern Rail Access are essential, not just for Heathrow, but for the surrounding areas. Providing this infrastructure will increase public transport mode share, reducing the negative impacts on the local environment from car journeys such as traffic and emissions.

Southern Rail Access will also provide choices, by rail, for the large swath of Heathrow's passengers who live in South West London that don't rely on a journey into and out of central London. Western Rail Link will do likewise for the population to the west of the airport. While Crossrail 2 is not directly linked to Heathrow, enabling it to connect smoothly and quickly with Crossrail, Southern Rail Access and the existing rail and underground networks will mean more and more people are able to get to Heathrow more quickly and conveniently, whether they are coming across London or through it.

These, again, are good for the passenger, the local areas and the country as a whole. Planning and investment in progressing these strategic links to Heathrow should be a high priority in London's infrastructure improvements.

Heathrow Hub Ltd response to the National Infrastructure Commission's Call for Evidence

8th January 2016

Introduction

Heathrow Hub Ltd. is pleased to respond to the Commission's call for evidence on London's transport system, and the strategic options for future investment in large-scale transport improvements.

We are the promoter of one of the three schemes for airport expansion shortlisted by the Airports Commission and currently being considered by Government.

We suggest that the Commission considers London's transport system as part of a wider regional network. We believe that London, in its narrowest geographical sense, cannot be considered in isolation if the objective is to achieve the most economically, socially and environmentally effective and efficient overall system.

Investment in large-scale transport infrastructure improvements in London

Government has directed that the Commission is not to consider issues relating to airport capacity, stating "*the Davies Commission has already examined this issue in detail.*" However we believe the critically important issue of airport surface access should not be separated from wider considerations of London's transport network.

Heathrow suffers from poor rail connectivity compared to its major competitors, and passenger numbers will continue to grow as airlines optimise scarce capacity through use of larger aircraft. DfT forecasts terminal passenger numbers will increase in a two- runway constrained airport, from 73m in 2014¹ to c.93m by 2050.² An additional runway, if approved by Government, is forecast to increase Heathrow's terminal passengers to 170m by 2050.³

Roads are increasingly capacity constrained and background growth in rail demand places growing stress on the rail network. Separate consideration of airport and non-airport connectivity is unlikely to achieve the most efficient outcome.

Heathrow Express shows why an integrated strategy is needed. Using 20% of the Great Western Main Line's (GWML) constrained capacity, and scarce platform capacity at Paddington, it achieves a

¹ <http://www.heathrow.com/company/company-news-and-information/company-information/facts-and-figures>

² Annex E2 Terminal Passenger Forecasts (constrained), UK Aviation Forecasts DfT January 2013
https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/223839/aviation-forecasts.pdf

³ Annex D8 ibid

very low load factor of c30% in the critical three-hour morning peak, at a time when other GWML services are operating at or above 100% capacity.⁴

As well as being inherently inefficient, this form of dedicated airport service fails to provide the best possible service for air passengers. European experience at for example Schiphol, Frankfurt and Charles de Gaulle shows that airports which are instead served by through stations on main lines provide air passengers with very high frequency services to a wide range of destinations.

Other passengers also benefit from the additional network capacity that would otherwise be inefficiently used by dedicated airport services. This is highly relevant to Government's request that *"the Commission should consider relevant international experience in major metropolitan areas, to review how other cities have responded to similar challenges and priorities, and whether there are any lessons to be learned and applied in London."*

The proven European approach has now been adopted in part for the similarly capacity constrained Brighton Main Line, where Gatwick Express services also serve Brighton in the peaks.

However, plans for dedicated airport services over a new Western Rail Access to Heathrow (WRAtH) continue to be progressed, despite the Airports Commission's analysis showing that such dedicated airport services from Reading and intermediate stations would have extremely low load factors⁵ as a result of slow journey times and the need for most passengers from the west to change trains at Reading.

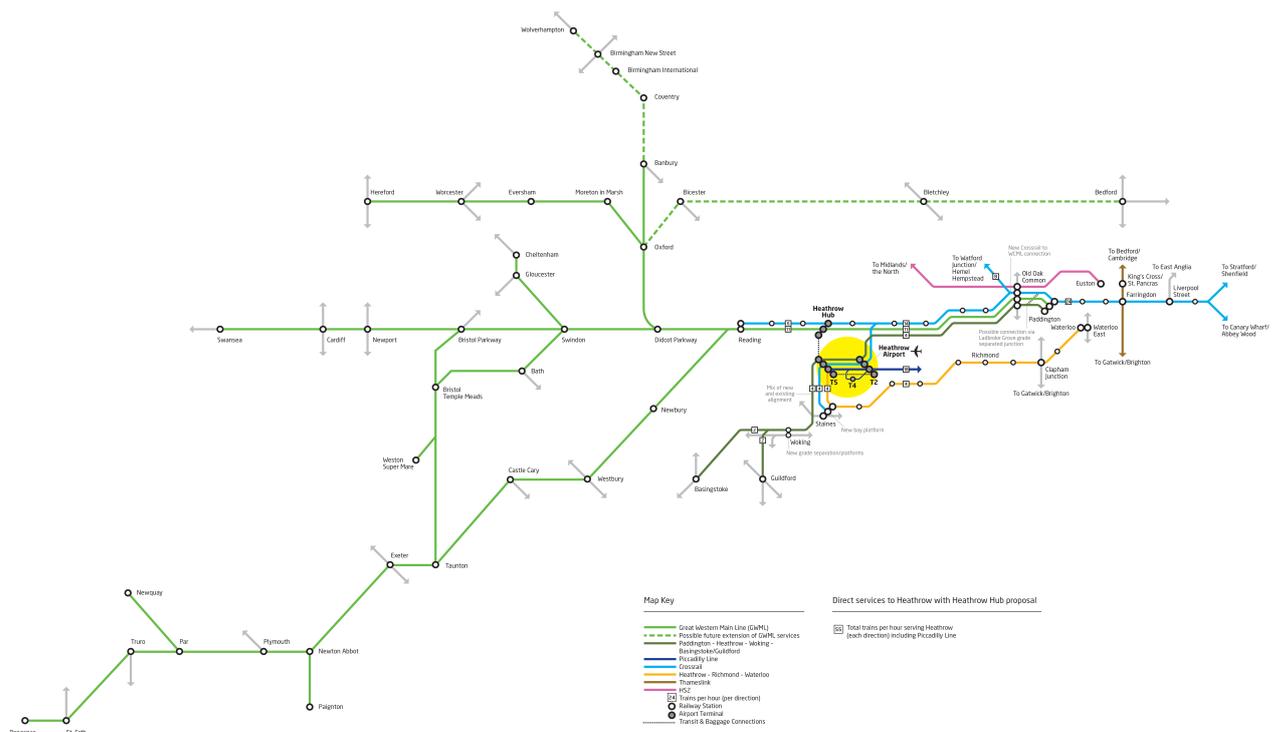

This is relevant to the Commission's consideration of London's rail network. WRAtH requires significant (4tph) capacity on the Great Western Relief Lines which, together with the need to retain and potentially increase freight paths, will act as a considerable constraint on Crossrail and prevent this very large investment from maximising its potential to the West of London. The proposed relocation of Heathrow Express's depot to Langley as part of the HS2 scheme may further exacerbate these capacity challenges, (with the additional risk that the depot could be redundant after expiry of Heathrow Express's Track Access Agreement in 2023).

Our alternative innovative and integrated approach to Heathrow's rail connectivity has two major benefits.

- It provides benefits to both airport and non-airport users, in line with Government's recognition of the need to *"consider the relative importance of, and trade-offs between, capacity, reliability, journey times and connectivity to markets"* and;
- It has a relatively low capital cost and high revenues, (as well as delivering very substantial wider economic and environmental benefits) and is therefore capable of being entirely financed by the private sector. This meets the Government's objective of *"funding and financing (infrastructure) in a way that minimises the tax payer burden."*

⁴ Table 4.2, London and South East Route Utilisation Strategy, Network Rail July 2011

⁵ *"A four train per hour service would have spare capacity with the busiest sections reaching 31% of seat capacity but reducing to as little as 16% of hourly seated capacity (and 6% of hourly total capacity) at the Reading end of the WRAtH route"* - Para 4.7.8, Surface Access: LHR-NWR, Jacobs for Airports Commission, November 2014

Our proposals comprise two principal elements.

1 - Heathrow Hub interchange

This road and rail interchange provides a new airport entry point and passenger processor, located on a largely unconstrained and readily developable 200 acre site c.4km north of Heathrow T5, on the Great Western Main Line (GWML) between Iwer and West Drayton stations where it crosses the M25. Fast passenger transit and baggage connections link the interchange directly to the airport campus, providing options for airside, landside or combined systems.

The station layout allows all GWML trains to call, with through lines allowing the option of Main Line non-stopping trains to pass at line speed. The station also effectively provides a dynamic loop on the Relief Lines in each direction, which, with its location roughly mid-way between Reading and Paddington, allows a new “Crossrail Express” service pattern west of Paddington. This, stopping only at Heathrow Hub and Reading, would be highly attractive to Reading passengers, incurring only a 8-10 minute journey time penalty compared to existing GWML services between Reading and Paddington.

This penalty would be more than offset by enabling passengers to avoid the need to interchange to Crossrail at Paddington. The likelihood that Crossrail will be integrated into TfL’s zonal fares structure also makes this an attractive alternative to existing GWML services, freeing these from the constraints imposed by their currently attempting to serve both commuter and long distance markets. The cross-platform interchange between stopping and express Crossrail services at the Hub would also reduce journey times for passengers from intermediate stations.

Current plans envisage 14 of the peak 24tph Crossrail service from the East turning back West of Paddington.⁶ With our proposal the extension of Crossrail to Reading allows a service pattern that unlocks the project's full potential and maximises the very considerable investment in this new infrastructure.

The Airports Commission also recognised the potential for the Hub interchange to provide air quality⁷ and road decongestion benefits⁸ as a result of dispersing road traffic entry points to the airport – an example of the benefits of an integrated, multi-modal approach to transport infrastructure planning.

2 - Southern Rail Access

This consists of two separate but related service groups.

The first, an amended version of BAA's former Airtrack scheme, provides direct services from London Waterloo to Heathrow via Clapham Junction and Richmond using a section of new rail infrastructure North of Staines between the Windsor Lines and Heathrow. We propose this would also be used by Crossrail, extending currently planned Heathrow services to terminate in a new bay platform at Staines to provide connectivity with currently un-served South Western catchments.

The second is a fast rail link from Woking to Heathrow, with trains from the South operating over a further new section of railway South of the junction with the Windsor Lines, twinned with the M25 motorway corridor and continuing through Heathrow, using the existing Heathrow Express paths, to Paddington. This overcomes the problems that contributed to the failure of Airtrack, including uncompetitive journey times and extended level crossing barrier downtime.

These combined proposals provide major benefits, those relevant to the Commission including:

- Direct trains to Paddington from the South and South West, providing an alternative London terminal with Crossrail providing excellent connections to the West End, the City and Docklands.
- Significant crowding relief to the South Western Main Line (and the LUL network at Waterloo for onward journeys). The density of operation on the Up Fast Line from Surbiton during the peak is higher than on any other single stretch of main line in the UK and Network Rail's Wessex Route Study forecasts a need for an additional 60% capacity in the high peak hour by 2043.⁹

⁶ <http://content.tfl.gov.uk/rup-20150212-part-1-item-09-crossrail.pdf>

⁷ The proposed Hub interchange "could potentially produce air quality benefits by bringing traffic off the M4 and M25 before reaching Heathrow" - Para 8.16 Final Report, Airports Commission July 2015

⁸ "The Hub has the potential to intercept traffic flows destined for Heathrow from the north and west, reducing pressure on already congested sections of the M4 and M25, plus the local roads approaching the terminals. Jacobs traffic analysis provides evidence that the approach reduces pressure on M25 junction 15, with lower peak hour flows approaching from all directions" - Para 5.3.2, Appraisal Framework Module 4, Surface Access: Heathrow Hub Station Analysis Compendium, Jacobs May 2015

⁹ "An additional 60 per cent capacity is required in the high-peak hour to meet the 2043 capacity conditional output for Main Line long distance services (conditional output CO3). This implies a need for more than 150 extra passenger vehicle arrivals at London Waterloo during the high-peak hour, which is equivalent to an additional 13 paths (assuming 12-car 20 metre vehicles configured with 3 + 2 seating in standard accommodation)" – Para 4.2.44, Wessex Route Study, Network Rail August 2015

- Significant crowding relief to LUL services at Waterloo.
- Maximising effectiveness of Crossrail investment.

More radically, this proposed service pattern could take advantage of the possible intervention identified in Network Rail's Western Route Study of a new grade - separated junction in the Ladbroke Grove area in CP6 alongside a rationalisation of the Paddington approaches.¹⁰ Subject to the detailed design of the junction, it is possible that this would allow Woking/Heathrow services to run on the Great Western Main Lines from Airport Junction, using existing Heathrow Express paths, before crossing to the Relief Lines to continue through the Crossrail central London tunnel. This would dramatically improve London's connectivity whilst also releasing valuable platform capacity at Paddington.

We commissioned modeling from AECOM (formerly URS), using, with their agreement, HAL's "LASAM" and TfL's "Railplan" models.

The results indicated an average peak loading of around 387 passengers per train between Woking and Heathrow (around 60% of capacity), the majority of whom are forecast to transfer from Waterloo services. This provides significant and highly desirable direct relief to the South Western Main Line and the LUL network serving Waterloo.

The trains would be at around 100% of capacity between Heathrow and Old Oak Common – compared with c30% for Heathrow Express currently, thus delivering effective use of scarce line capacity.

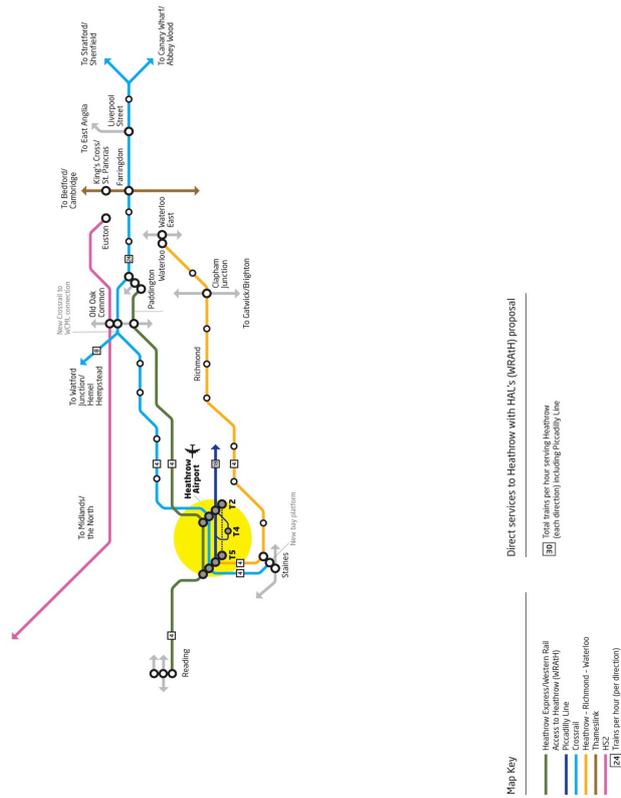

Conclusion

We believe our proposals provide overwhelming benefits and, critically at a time of constraints on public expenditure generally and on rail enhancements in particular, are capable of being privately funded.

Our proposals have been developed with a world class team of expert consultants including AECOM, Gardiner & Theobald and First Class Partnerships and in liaison with Network Rail and TfL. Heathrow Hub Ltd has also participated as a full member in Network Rail/DfT's Southern Rail Access Working Group, the report of which is due to be published shortly.

We believe it is helpful to compare our integrated proposals with the alternative rail schemes that are being separately brought forward.

¹⁰ "Grade separation of Ladbroke Grove Junction would increase the capability of the whole system, reducing the level of conflicting train movements creating greater timetable capability, increasing flexibility in the platforming and operation of services using London Paddington and associated depots"- 05, Western Route Study, Network Rail August 2015

In contrast, the current uncoordinated plans for Heathrow Express, WRAtH and Crossrail achieve far fewer benefits at a high cost to the public purse, deliver a lower overall return on investment and, in the case of WRAtH, are likely to require ongoing revenue support.

We have deliberately made this submission as brief as possible but would of course welcome the opportunity to engage with the Commission to discuss our proposals in greater detail.

National Infrastructure Commission call for evidence: 'London's transport infrastructure'

Evidence submitted by the iBUILD Infrastructure Research Centre,
January 2016

Introduction

The iBUILD (Infrastructure **B**usiness models, valuation and **I**nnovation for **L**ocal **D**elivery) Infrastructure Research Centre brings together a multi-disciplinary team from Newcastle, Birmingham and Leeds Universities to improve the delivery of local and urban infrastructure. iBUILD is developing and demonstrating alternative infrastructure business models that: take a whole life cycle view of infrastructure systems; exploit technical and market opportunities from modern interconnected infrastructure; leverage economic, social, environmental, aesthetic and other values from infrastructure; identify changes in governance, regulation and policy to unlock improvements; and, use innovative financing and funding mechanisms.

iBUILD promotes a service and system-wide approach to local and urban infrastructure, believing that there are significant advantages to be gained from planning, investing and managing infrastructure on an interdependent basis. As the recent floods in Cumbria, Northumberland and elsewhere in the north of England demonstrated, long-term resilience should be built into the UK's infrastructure sectors and systems. Otherwise, the potential economic and social benefits that can be derived from infrastructure investment will be marginal compared to the economic, social and environmental costs of repairing infrastructure that is damaged or destroyed by adverse (but increasingly regular) weather-related events.

The emergence of the National Infrastructure Commission (NIC) reflects the recent emphasis towards national scale infrastructure planning in the UK, and provides an important strategic context for the planning, development and operation of infrastructure. However, it is also important to consider the distinct role of local and urban infrastructure in driving local, regional and national economies. It is at the local and urban scales where infrastructure services are most dense and where the majority of people use infrastructure services in their everyday lives. Balancing growth across different geographical scales – from the local to the city/city-region – is vital to the long-term success of the national economy, as infrastructure drives local economic growth and job creation, as a consequence of construction and management activities as well as the enhancement and facilitation of other economic activities.

The response below first summarises key findings from our research programme that are relevant to all infrastructure delivery, before specifically responding to the consultation questions. Our response draws predominantly on new research identified during the iBUILD project, but also decades of research and experience in the iBUILD team. This includes engineering expertise in the Centre for

Earth Systems Engineering Research (CESER)¹ and the Institute for Resilient Infrastructure (IRI)², and the long-standing track record in local and regional development by the Centre for Urban and Regional Development Studies (CURDS).³

iBUILD focuses on all infrastructure sectors, not just transport, but our work has also drawn lessons from non-infrastructure sectors. Where our research is undergoing external peer review we cite working papers which, amongst other work, can be found at www.ibuild.ac.uk.

iBUILD Mid-Term Review and Policy Manifesto

In March 2015, iBUILD published a mid-term review and manifesto setting out thirteen evidence-based policy recommendations on how local and urban infrastructure business models could be strengthened in both design and in application. The key recommendations are elaborated in the full manifesto document which is available online.⁴

Research from across the iBUILD Centre has identified five priority action areas for government and industry. If applied to all infrastructure planning and decision-making, these action areas will help to challenge the “timid, uncoordinated, incremental, wasteful”⁵ way the UK currently builds and manages its infrastructure, and help to develop a new approach to delivering infrastructure systems and their services that will enhance the health, wealth and security of UK citizens.

Priority Action Area #1: Have a broader, integrated appreciation of infrastructure

Infrastructure is not just tracks, tubes and trunk roads. Failure to consider the resources that flow along these, the services they provide and the people and businesses that depend on them, will lead to investments that don't deliver effectively. At the same time, it is crucial to understand how all these systems are interconnected; infrastructure depends on other infrastructure to work, not just technically, but also economically and socially. The UK's infrastructure is amongst the most mature and interconnected in the world and therefore has a pressing need to adopt a broad, integrated and sophisticated approach to infrastructure planning.

Recommendation 1: Infrastructure planners, financiers, engineers and other stakeholders need to use a broad, but appropriately specified, definition of infrastructure if they are to identify the full range of opportunities from alternative business models.

Recommendation 2: Housing and ‘hidden infrastructure’, such as efficiency measures, should be considered alongside the large-scale capital investments with which they interconnect, within infrastructure and spatial planning processes

⁴ iBUILD (2015) *Are you being served? Alternative infrastructure business models to support economic growth and well-being*, iBUILD Manifesto and Mid-term Report, Newcastle University: Newcastle upon Tyne. The full manifesto can be downloaded from <http://research.ncl.ac.uk/ibuild/outputs/>

⁵ Infrastructure UK (2010) *National Infrastructure Plan 2010*, First NIP: October 2010, HM Treasury.

Recommendation 3: National reforms in policy and regulation are required to enable an integrated approach to local infrastructure planning that can identify, and has the capacity to exploit, synergies across infrastructure sectors.

Priority Action Area #2: Enable action at the local scale that connects with the national

Too much infrastructure planning is top-down, yet every piece of infrastructure has to go somewhere; it is inherently local. Top-down approaches to infrastructure development and management stop locally-led and innovative business models from flourishing and discourage innovation. It also risks the wrong infrastructure being put in the wrong place at the wrong time because of a lack of local knowledge, engagement and ownership. These issues prevent the UK from maximising returns from infrastructure investment. The UK must devolve an appropriate and sensible proportion of infrastructure investment and responsibility to local institutions so they can deliver infrastructure that better reflects the values and needs of the communities it serves, yet remain mindful of the national strategy.

Recommendation 4: National and local policy frameworks should be realigned to focus on delivering wider societal benefits and to enable local infrastructure business models to emerge that can provide local solutions that are complementary with mainstream systems.

Recommendation 5: Effective operation of local alternative infrastructure business models requires greater fiscal decentralisation, complemented by a stronger and statutory devolved role for cities and localities in the planning, development and delivery of infrastructure.

Recommendation 6: Provide support for a wider range of innovative local infrastructure financing mechanisms, including tax increment financing, municipal bonds, social impact bonds and crowd source funding approaches.

Priority Action Area #3: Capture long-term value of every kind

Infrastructure is not only about cash returns. Investment in infrastructure provides wider health, economic and environmental benefits for society; infrastructure converts financial value to social value. A new economic valuation system that recognises these long-term, whole-life benefits is essential to maximise the benefits. Infrastructure must also be built for minimum whole-life costs. This might mean paying a bit more upfront for something that will last – and serve – for longer without the need for frequent maintenance; a resilient and sustainable infrastructure.

Recommendation 7: Incorporate measures of social and environment benefit (and cost) into infrastructure appraisal frameworks to recognise the wider societal and environmental outcomes and ascertain the widest possible set of mechanisms to capture revenue and other values.

Recommendation 8: Implement a quantitative framework within the infrastructure appraisal process to assess the value of flexibility and resilience across the whole system over the long-term.

Recommendation 9: Local authorities and infrastructure owners should apply resource assessments as a matter of course to identify the potential of land and infrastructure assets to generate long-term, stable revenue streams and not just one-off, short-term windfalls from selling-off assets.

Recommendation 10: Employ a new approach to infrastructure economics that recognises the long-term and system-wide value of infrastructure provision.

Priority Action Area #4: Deliver more efficient planning, procurement and delivery

Approaches to project financing, funding and delivery should not be chosen for political reasons. Mechanisms must be adopted that can best deliver the desired economic, social and environmental values, regardless of their political flavour. Many of methods and tools to enable this already exist: the Project Initiation Routemap, Building Information Modelling (BIM) systems, life-cycle assessment, so they must be used. These approaches support more efficient planning and procurement, minimise costs and human effort, preserve the environment, and maximise the potential to reuse and recycle materials and components in the future.

Recommendation 11: Implementation of the Project Initiation Routemap has been shown to have many cost reduction benefits and should be made standard practise for all public funded projects.

Recommendation 12: Planning and design of infrastructure should consider the material and resource demands of infrastructure pipelines to identify opportunities for reducing waste in the construction and operation phases, whilst designing for end of life material recovery or repurposing of infrastructure.

Priority Action Area #5: Accelerate the uptake of innovations through practical action and demonstration

Action often speaks louder than words. Alternative approaches to infrastructure business models are emerging. However, to quickly identify the most successful approaches and encourage their wide uptake locally, nationally and internationally, a number of ambitious demonstrator sites should be established for integrated infrastructure planning and testing of innovative infrastructure business models.

Recommendation 13: Establish full-scale urban demonstrator sites for integrated infrastructure planning and testing of innovative infrastructure business models.

1. What are the major economic and social challenges facing London and its commuter hinterland land over the next two to three decades?

Key messages:

- *As with all UK cities, London faces significant economic, social and environmental challenges over the coming years. Population growth, in absolute and relative terms, poses a particularly significant challenge in London and the wider city region.*
- *Governing and planning for growth and meeting future challenges, in London and the wider city region, requires effective institutional and administrative co-ordination between the Mayor of London, Greater London Authority and local authorities in the south east of England.*
- *No strategy will tackle all the challenges, and trade-offs between planning and infrastructure choices are inevitable. However, redressing the London-rest of UK balance by stimulating growth elsewhere will help alleviate many of these pressures in London.*

iBUILD researchers have been examining the governance of infrastructure funding and financing in the London mega city-region. Interviews undertaken as part of the study have sought to identify the major economic, social and environmental challenges facing London in relation to infrastructure.⁶ The overwhelming majority of interviewees have stated that the fundamental challenge facing London is how to ensure that there is adequate housing, transport, water, energy, communications and other infrastructure to accommodate and absorb the significant population growth that has taken place, and is projected to occur, within the administrative boundaries of London and the broader city region. In one interview, a stakeholder suggested that:

“Population growth requires the opening up of new locations for housing growth. There could also be the opening up of existing residential areas. All the accompanying infrastructure that is required to enable housing growth to be sustained is the number one challenge.”

Dealing with the implications of population growth poses profound questions about the planning, governance, funding, financing and operation of infrastructure across and within the London functional economic geography. There is limited, if any, formal strategic planning activity across the functional city-region, and there are noticeable differences in the institutional capacity, statutory responsibilities and funding of the Greater London Authority (GLA), London Boroughs and individual local authorities and Local Enterprise Partnerships (LEPs) in the south east of England outside London. The limited strategic planning capability at the interface of these organisations makes the case for long-term planning and securing public and private (particularly international) investment in infrastructure problematic. The Mayor of London, GLA and South East local authorities and LEPs are

⁶ Stakeholder organisations that have taken part in the iBUILD research, include: the Greater London Authority; Transport for London; London First; and the Department for Transport.

attempting to overcome these spatial challenges by working through a new voluntary ‘wider south east summit’ framework. These arrangements could offer some scope for project or programme-based ‘deal-making’ between different local authorities in the city region in an attempt to plan urban development collaboratively and to use geographical scale as a means of generating new investment and attracting private sector contributions in infrastructure in London and the wider South East. Continued institutional ‘reform’, in an attempt to overcome local administrative fragmentation, and improve urban economic performance⁷ is a noticeable feature of how many global cities are governed.⁸ The recent establishment of *Métropole du Grand Paris*, as well as current plans to manage the delivery of spatial and economic strategies within and across the Sydney ‘city-region’, illustrate how local and national actors continually attempt to co-ordinate and ‘improve’ the governance of large metropolitan areas.⁹

The other major economic and social challenges facing London and the wider city-region, include:

- Improving transport mobility and accessibility for people in London and the wider city region, for work and leisure purposes.
- For many employers, the issue of housing is of heightened significance because of the affordability crisis and some of the difficulties that companies face in recruiting and retaining staff in London. Ensuring that ‘doing business’ in London remains a viable proposition for international and national firms, which means preventing the cost of business (in terms of commercial rents) from becoming prohibitive.
- Providing sufficient brownfield sites in London and the wider city region for commercial and residential use, and that GLA, London Borough and local authority statutory plans are aligned and there is agreement upon what development is built where.
- Tackling poverty and low wages in London, and ensuring that transport infrastructure supports affordable access to job and training opportunities and addresses and does not exacerbate the problem of rising inequality in different parts of the city and city region.
- Managing the growing demand for health and social care services, as well as ensuring there is ‘quality’ early years and post-16 education for children and young adults.
- Creating and maintaining sufficient green spaces to underpin and support greater social equality and improved individual and collective environmental health and well-being.
- Addressing poor air quality and environmental degradation.
- Improving water quality and maintaining the effectiveness of flood defences.

⁷ Ahrend, R., Farchy, E., Kaplanis, I. and Lembcke, A. C. (2014) ‘What Makes Cities More Productive? Evidence on the Role of Urban Governance from Five OECD Countries’, *OECD Regional Development Working Papers*, 2014/05, Organisation for Economic Cooperation and Development: Paris.

⁹ ‘Grand Paris’ will encompass an assembly of 209 councillors, drawn from local municipalities, and its area of jurisdiction will cover the densest part of the Paris region (covering approx. 7mn people). The new institution will incrementally take on new responsibilities, including urban planning and fiscal powers. By 2018, it will be headed by a new president. The Greater Sydney Commission is a new independent body, created by the New South Wales Government, which will be responsible for metropolitan planning in the Sydney metropolitan area, in partnership with State and local government – see:

<http://www.planning.nsw.gov.au/Plans-for-Your-Area/Sydney/A-Plan-for-Growing-Sydney/Greater-Sydney-Commission>

- Ensuring that London and the wider city region have the capacity and capability to fund and finance urban infrastructure now and in the future. Link to value capture in uplift from public investments and improving on the historically weaker efforts e.g. with Crossrail

It is rarely possible to satisfy all objectives, as is shown in Figure 1, where, for example, strategies that are good for managing flood risk can increase transport use and travel distance for commuters.

Figure 1: Tradeoffs between planning and infrastructure investment choices in London

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to Crossrail 2?

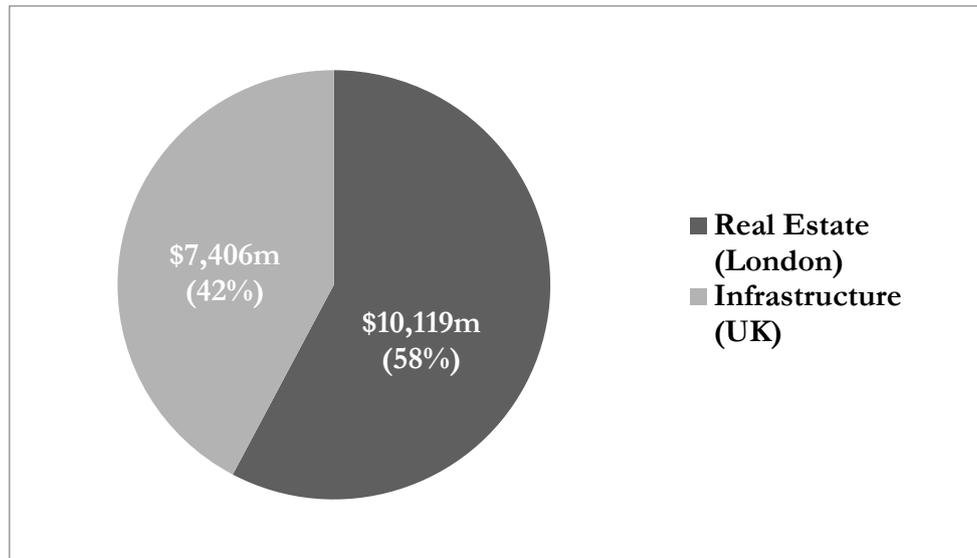

Key messages:

- *Transport infrastructure improvements led by Transport for London and other similar sponsors will increasingly be required to demonstrate their contributions to growth, jobs and housing development, beyond alleviating transport congestion.*
- *Private sector investors are more likely to invest in the early stages of transport schemes if they are part of a broader urban regeneration or development programme*
- *Central government will continue to play an important role in providing regulatory and/or financial backing for large-scale transport projects in London.*
- *Government financial support is also likely to form part of broader, multi-faceted funding packages.*
- *Small-scale interventions can play an important role in improving London's transport infrastructure.*

Under the leadership of Sir Peter Hendy, Transport for London (TfL) began to situate transport investment in a wider context and as an instrument that is measured for its broader impact above and beyond achieving journey time savings. TfL's corporate strategy and business plan have been written so that they identify and explain how individual investment transport infrastructure projects will contribute towards the economic growth and overall prosperity and performance of London. TfL has concluded that planning and investing in transport for London has to demonstrate the wider economic costs and benefits of investment.

Against this background, TfL and other transport infrastructure sponsors have framed Crossrail 2 as a specific intervention that could open up new housing sites and development opportunities as well as improving transport connectivity. This approach reflects the belief that there is a virtuous relationship between transport – housing – spatial planning and local/urban development. International sovereign wealth funds looking to invest in London's transport infrastructure will do so if there is a definitive revenue-raising urban regeneration or housing development scheme attached to a transport project, such as the Nine Elms development, which includes the Northern Line extension. The returns available in London real estate and property make investments in these assets more attractive to foreign investors than transport infrastructure alone (see Figure 2). Furthermore, major transport schemes will always require government-funding as they are often considered too risky for the private sector. Thus, national and local/city-regional governments will continue to play a major role in transport infrastructure planning and investment, especially in large metropolitan areas like London, despite the fact that investment markets are more buoyant in these places than in many other cities.

Figure 2: China foreign direct investment in the UK (2005-2014)

Source: Pinsent Masons and CEBR (2014).¹¹

In terms of future transport linkages, TfL, the Greater London Authority (GLA) and local authorities should recognise the importance of both radial and orbital transport connections in the London city region, as there are important economic units within and outside London's formal administrative boundaries. This requires economic and spatial plans to be aligned and to consider how London and the wider city region is set to develop in terms of population, housing and business growth. For example, in an illustration that the economic centre of London has been moving 'eastwards', TfL announced in January 2016 that it was re-zoning eight London Underground stations near Stratford and the 2012 Olympics site to the boundary of Zone 2 of the Underground.¹² Much of London's future growth is expected to be focused on the capital's Opportunity Areas, which will feature dense, mixed-use developments with high public transport connectivity – particularly in the east of London (Travel in London Report 8, 2015). TfL and the GLA are using the Opportunity Areas to shape and steer the London Plan and give it a clear linkage to economic strategies. Going forward, there will be a visible link in how transport is expected to transform the Opportunity Areas.

Atkins suggests that the focus on public transport improvements (such as rail and road capacity) could be strengthened in the London Infrastructure Investment Plan 2050 if priority was given to bus and cycle networks (to better connect outer London and are important assets for lower-income households)¹³ – helping to build and support a more inclusive and sustainable city region. While the remit of the NIC is on major transport schemes it is important to recognise that there are direct and indirect economic, social and environmental impacts from investment decisions that are based on small-scale interventions. There is also a need to focus on improving the existing transport network in

¹¹ Pinsent Masons and CEBR (2014) [China Invests West: Can Chinese Investment be a Game-changer for UK infrastructure?](#) Pinsent Masons and CEBR: London.

¹² Topham, G. (2014) 'East London tube, DLR and rail stations change zones', [The Guardian](#), Monday 4 January.

¹³ Atkins (2015) [Future Proofing London](#), Atkins and Oxford Economics: London.

London, building upon TfL's interest in whole-life asset management and benchmarking in support of improving performance and resource efficiency. We would, therefore, expect TfL and local highways bodies to look at how best to improve the maintenance and operation of the existing road network, which has seen increased congestion recently, particularly in parts of outer London. SMART technology can also help to manage performance, and TfL has made significant strides in gathering, analysing and deploying 'big data', but as recent events have demonstrated, even these assets have to be made more resilient to 'shocks'.¹⁴

We would anticipate that the strategic options for future transport investment in London would encompass, or at least benefit from, further rail devolution to London and the South East. TfL is looking to apply its existing operational experiences to suburban rail services, where, in some cases, there has been significant improvements. For example, the London Overground network, largely established since 2008, has seen a 321 per cent increase in journey stages between 2008 and 2014, on a like-for-like basis – reflecting the rapid development and enhancement of the network.¹⁵

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Key messages:

- *Crossrail 2 must better capture the value it delivers to the private sector, in particular through capturing the uplift of land and property value, and improving connections to major transport hubs.*
- *Crossrail 2 offers significant development opportunities and connectivity benefits, but at a projected cost of up to £32bn the case has to be made that this investment could not deliver better returns through a series of smaller scale projects in other UK regions.*
- *The Department for Transport, Transport for London and other major transport sponsors should heed the lessons of Crossrail, and consider the recommendations of the National Audit Office to ensure that Crossrail 2 and other large-scale projects deliver value for money for UK tax-payers where government grants have been included in funding packages.*

TfL estimates that Crossrail 2 will cost somewhere between £27bn and £32bn (with a 66 per cent optimum bias included), in 2014 prices and includes the cost of new trains and Network Rail works. In evidence to the London Assembly, PwC suggested that the estimated cost of Crossrail 2 could, if the optimism bias was reduced to a ‘more realistic’ 44 per cent, be around £20bn.¹⁶ The project intends to relieve demand on London’s transport network, and to provide capacity for an extra 270,000 people to access central London at peak times by increasing the number of trains from major destinations across south west London and Surrey (including Wimbledon, New Malden, Kingston and Epsom) and across north east London and Hertfordshire (including Tottenham Hale, Waltham Cross, Cheshunt and Broxbourne). A London Chamber of Commerce poll found that 44 per cent of London businesses saw Crossrail 2 as their top transport priority.¹⁷

The cost of Crossrail 2 is significant, roughly twice the annual capital investment budget spent in London (£15bn), and represents approximately £376m for every mile of the 85 miles of proposed line. The Chancellor of the Exchequer, George Osborne, has indicated that at least 50 per cent of the funding for meeting the cost of Crossrail 2 should come from private sources, which some business organisations have suggested is feasible.¹⁸ While some costs could be saved on the rolling stock for Crossrail 2, further costs are expected to be found during the detailed design stage of the route. A premium will be placed on TfL identifying further savings given that businesses believe that the high cost of transport projects in London is a significant barrier to the delivery of infrastructure improvements.¹⁹

¹⁶ Minutes of evidence available at: <https://www.london.gov.uk/moderngov/documents/s47535/Minutes%20-%20Appendix%201%20-%20Transcript%20Crossrail%202.pdf>

¹⁷ Further details on the London Chamber of Commerce poll available at: http://www.londonchamber.co.uk/lcc_public/article.asp?aid=7197

¹⁸ London First (2014) *Funding Crossrail 2: A report from London First’s Crossrail 2 Task Force*, London First: London.

¹⁹ According to business surveyed in the London Chamber of Commerce poll.

In putting together the funding and financing package for Crossrail 2, the lessons of Crossrail [1] should perhaps be heeded. In particular, Crossrail 2 will be scrutinised for how it captures private land and property value uplift that is expected to be generated given the experiences of Crossrail [1]. Researchers have forecast total house price growth of 13 per cent, between 2013 and 2018, for residential properties located near Crossrail stations, with up to 20 per cent growth in Central London, in addition to underlying capital growth.²⁰ With criticism that the taxpayer could have benefited more from Crossrail in the form of greater tax receipts on developments near proposed stations, it has been suggested that more targeted developer contributions should form part of the funding package for Crossrail 2.²¹ Furthermore, Crossrail does not connect with other recent transport investments such as the Eurostar station at St Pancras or Terminal 5 at Heathrow, and it does not necessarily serve the areas of greatest potential expansion in and around London. Consequently, the final agreed route of Crossrail 2 will need to connect or integrate effectively with other existing or proposed transport infrastructure assets, such as the HS2 terminus in Euston, without producing negative impacts for local residents and businesses in places such as Camden, which brings into focus once again the governance and spatial planning implications of co-ordinating major transport infrastructure investment in London and the wider city-region.

The broader industry contribution of Crossrail is, however, also significant, particularly in the area of skills, where the Tunnelling and Underground Construction Academy, funded primarily by Crossrail, is training the next generation of future engineers. Such inputs should ensure that there are legacies of improved efficiency and productivity in future large-scale [underground] transport infrastructure projects similar in nature to Crossrail.

With the current public consultation for Crossrail 2 closing on 8 January 2016, TfL will have, at its disposal, a large volume of evidence and opinion, submitted as part of the consultation exercise. In addition, the Crossrail 2 Growth Commission's call for evidence, which closed on 23 December 2015, is also expected to be an important source of information, data and evidence that TfL and partners will have as they seek to reflect upon how best to strengthen the benefits and reduce the costs of Crossrail 2. In the current austere times, and with demands for more transport investment in the regions and nations outside of London, the economic, social and environmental case for Crossrail 2 will come under ever-closer scrutiny, and the project will need to demonstrate that it can be delivered in an effective and cost-efficient manner. TfL and the other sponsors of Crossrail 2 will no doubt be guided by the findings of the National Audit Office in its 2014 report on Crossrail, to see what lessons that can be applied in the project development and implementation of Crossrail 2. In considering the costs and benefits of Crossrail 2, it is useful to reflect upon the following recommendations in the NAO's review, which were directed specifically at the Department for Transport (DfT), and outlined a series of steps to strengthen tax-payer 'value for money' from future major transport projects:²²

- Do more to secure private sector funding contributions. The Department should ensure that when it negotiates contributions to projects from businesses and other organisations, these are based on

²⁰ CBRE (2013) *Crossrail: The Impact on London's Property Market*, CBRE: London.

²¹ Pickford, J. and Allen, K. (2014) 'Crossrail a shot in the arm for London property developers', *Financial Times*, 6 March 2014.

²² NAO (2014) *Crossrail, Report by the Comptroller and Auditor General*, National Audit Office: London, p11.

robust and realistic calculations of the benefits to business. The Department should also work to understand private sector funders' interests in its projects and how these may affect the certainty of funding.

- Consider how to achieve greater continuity in departmental officials' oversight of major programmes. The Department should identify how it will manage staff assignments to its various programmes, ideally to appoint officials for longer periods, and to manage the 'handover' process, where necessary, to achieve a smooth transition.
- Monitor all costs on major programmes including development, start-up and sponsorship costs so that it can develop an understanding of the true costs of major programmes, to help it keep these costs under control. We would expect all government departments to do this on their major programmes.
- Ensure that programmes have sufficient cash available to provide security and flexibility to the delivery body, while minimising opportunity costs.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

Key messages:

- *iBUILD research has identified a range of funding and finance schemes (Table 1) suitable for large projects, each with different advantages and disadvantages.*
- *TfL's strategic oversight in London, compared to other transport governance structures in the UK, provides them with far greater opportunity to capture and utilise value.*
- *TfL and other transport infrastructure sponsors in London will be encouraged to identify and adopt more 'innovative' funding and financing packages to support transport infrastructure investment. However, such packages are likely to be based on greater speculative forms of urban development and therefore may increase the financial risks for TfL and other institutions.*

Against the background of a reduction in central government grant funding to cover its operational budget, TfL has been encouraged to be more 'innovative' in how it funds and finances transport infrastructure in London. According to one DfT official:

“We've strongly encouraged TfL to get more savvy in the way it generates income from its estate, for example, so it's got a very ambitious commercial development programme now, which covers everything from, the sponsorship deals for Santander cycles to advertising at tube stations, to flogging off the old headquarters at 55 Broadway, which is all going to be turned into luxury homes and so on...” (iBUILD research interview with DfT official, September 2015).

There is a strong push for TfL to widen and deepen its engagement in land and property development in order to generate new revenues to fund transport infrastructure and/or services. Consequently, there are few, if any, projects in TfL's capital investment plan that are not linked to economic development, employment or housing. TfL believes that this will enable the organisation to leverage additional private and public funding. While grant funding is still the preferred mechanism, in the current fiscal climate this is increasingly testing, although for major transformational projects central government is still expected to commit resources as part of overall funding packages. While TfL is looking to become 'self-sufficient', the organisation believes that 'transformational' infrastructure schemes will require alternative funding mechanisms, which draw upon finance from a range of different sources.

As infrastructure becomes funded and financed in increasingly financialised ways, different practices, tools, instruments and governance arrangements are being modified or constructed in order to fund and finance local infrastructure. A variety of different infrastructure funding and financing practices have emerged in recent years, many of which blur and/or straddle traditional notions of public-private boundaries (Table 1). We would expect TfL and its partners to adopt some of these practices to suit specific projects and geographical contexts, subject to appropriate fiscal powers and capability being

evident. Some transformative transport schemes will require national government financial backing, in the form of direct grant, infrastructure guarantee or through borrowing. However, the likelihood is that international and national private infrastructure financiers will be reluctant to invest in the early phases of the infrastructure life-cycle of major transport projects:

“Some commentators cite that a “wall of money” from Sovereign Wealth Funds, Infrastructure Funds, Pension funds and other similar investors is available to invest in infrastructure, and that this provides evidence that projects such as Crossrail 2 could be privately financed. While there is no doubt that these investors are keen to invest in infrastructure, Crossrail 2 is unlikely to meet many of their investment requirements. The size of the project, the construction risk, the demand risk and the likely reliance on non-patronage revenues to pay the bulk of the project means that, without direct government guarantees, such investors are unlikely to invest in Crossrail 2”.²³

We would recommend that the NIC examines the 2014 report produced by PwC, which considered the range of different mechanisms and practices that could be used to fund and finance Crossrail 2.

Land (or property) value capture mechanisms offer a potential funding source for Crossrail 2. However, in the iBUILD case study of the governance of infrastructure funding and financing in London, officials that were interviewed were mindful of the ‘political difficulties’ of increasing residential taxation, despite recognising that value capture was the only ‘fair means’ of ensuring that those who benefitted most from Crossrail 2 made the biggest financial contribution. Increasing fares to generate extra revenues is also problematic given commitments by the current Mayor of London to ‘freeze fares in real terms’, and other statements by mayoral candidates. Consequently, additional financial options are being explored, including the feasibility of extending the hypothecated business rate supplement tax that has been funding Crossrail [1].

Finally, TfL and other infrastructure sponsors should consider whether there are alternative quick and cost-effective wins from smaller schemes that could support London’s transport infrastructure and make the overall network more efficient. TfL could perhaps look at whether it is possible to make improvements, such as bringing back sections of unused rail line, to generate additional benefits, as has happened with the London Overground. The engineering consultancy firm, Atkins, makes a similar argument, suggesting that:

“The 2050 [London Infrastructure Investment] Plan rightly makes some ambitious plans for infrastructure provision. However, consideration should be given to whether investment in a greater number of smaller scale interventions could achieve wider benefits”.²⁴

²³ PwC (2014) *Crossrail 2: Funding and Financing Study*, PwC: London, p7.

²⁴ Atkins (2015) *Future Proofing London*, Atkins and Oxford Economics: London, p 88.

5. How have metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

Key messages:

- *Preparation of the London Infrastructure Investment Plan 2050 was an important step in defining strategic priorities, and echoed similar arrangements in other leading UK and international cities. Integrating this with other planning processes provides further opportunities.*
- *A review of over one hundred infrastructure business models by the iBUILD research team highlights the potential diversity of approaches that should be explored to capture more value from local and urban infrastructure.*
- *The ability of London to address its economic, social and environmental challenges, by implementing a wider range of transport infrastructure funding and financing mechanisms and practices, similar to those employed in other international cities, will depend upon the UK government granting London greater fiscal autonomy to raise and retain local tax revenue and increase borrowing for capital investment purposes.*
- *There is a case for a systematic study to be commissioned of how these issues are being tackled in other global cities. Sydney is making new moves to tackle these infrastructure and spatial planning challenges, as is New York and Paris, and there may be common lessons to be learned, which could benefit London.*

We welcome the fact that London has published its first infrastructure investment plan, along similar lines to strategies that have been produced and implemented by other global cities, such as New York, Tokyo and Seoul as well as other UK cities (e.g. the Newcastle-Gateshead Infrastructure Delivery Plan). Lessons from international practice suggest it is important that the London Infrastructure Investment Plan and statutory London [Spatial] Plan are closely aligned, and that the infrastructure plan also fits with local development and planning frameworks in and around the London city region. This requires close engagement, even co-production, between a wide-range of different institutions and actors. iBUILD research has highlighted the benefits of taking a whole systems view to infrastructure by considering integrating with spatial planning policies. For example, reducing demand for services through ‘hidden infrastructure’ such as investment in efficiency measures and demand management strategies reduces consumer bills, frees up capacity to support growth and regeneration, and defers the need for expensive capital investment in new infrastructure (e.g. for new power stations and water treatment works). The National Infrastructure Plan, for example, sets out a pipeline of £65bn investment in energy generation and £45bn investment in energy networks over the coming years. Yet, investing a third of this in energy efficiency measures over the next four decades could free up 12 per cent headroom in generation capacity.²⁵

²⁵ Gouldson A, Kerr N, Millward-Hopkins J, Freeman MC, Topi C & Sullivan R (in review) Innovative Financing Models for Low Carbon Transitions: Exploring the case for revolving funds for domestic energy efficiency programmes. Based on

In terms of funding and finance, London currently spends around 5 per cent of its annual Gross Value Added (GVA) on capital investment while its international competitor cities spend between 10-12 per cent.²⁶ One of the other challenges facing London is that it is still required to secure central government financial or regulatory agreement for major transport infrastructure on a project-by-project basis. And unlike other global city leaders, the Mayor of London and London Boroughs have limited powers to raise their own local revenue (Table 2).

Table 2: Municipal operating expenditures and taxes per capita

	Municipal Operating Expenditures per capita (£)	Municipal Taxes (local and shared taxes) per capita (£)
London – GLA plus boroughs (2011)	3,199	476
Berlin (2010)	4,910	2,570
Frankfurt (2010)	3,577	2,140
New York (2011)	4,561	3,078
Madrid (2009)	1,267	490
Paris (2011)	2,699	1,896
Tokyo (2010)	3,301	2,312

Source: Slack (2013: p5)

On the subject of fiscal decentralisation and global cities, we would direct the NIC towards two useful studies that have undertaken detailed analysis of how London compares to other global cities and city regions when it comes to planning, funding and financing urban infrastructure. The first reference is a working paper written by Enid Slack (University of Toronto) which was commissioned by the London Finance Commission.²⁷ The paper offers an international comparison of the current methods of raising revenues in seven global cities -- London, Paris, Berlin, Frankfurt, Madrid, Tokyo, and New York -- and evaluates the costs and benefits associated with greater devolution of revenue tools to the Greater London Authority (GLA), with Slack suggesting that:

“London would benefit from greater fiscal autonomy – access to a mix of taxes and the ability to set the tax rates. A mix of taxes would give it the flexibility it needs to respond to changing economic circumstances. Local fiscal autonomy and, in particular the ability to set tax rates, is also important for accountability: governments that raise their own revenues and set their own

taxes to meet local expenditure needs tend to be more responsible and more accountable to taxpayers.²⁸

The second report was published by PwC in 2014, and considers the various funding and financing mechanisms and practices that could be deployed to deliver investment in Crossrail 2, and includes a comparative analysis of how transport infrastructure projects are funded and financed in the following cities: Paris; San Francisco; Atlanta; Copenhagen; New York; Greater Toronto; Chicago; Melbourne and Sydney.²⁹ In the report, PwC concludes that London would find it problematic to replicate some of the funding arrangements employed in other international cities without greater fiscal autonomy:

“Our review of funding approaches used internationally shows that many other cities use a range of property and other taxes to fund transport infrastructure. On the face of it, similar levies implemented in London would be capable of funding a substantial part of the funding requirement for Crossrail 2. However, when we have looked at how such levies have been implemented, many appear to rely on enforcement systems that have evolved over time and in part rely on there being a general level of fiscal devolution across all local or regional authorities. This is several steps away from where London is now in terms of progress towards the first steps of fiscal devolution”.³⁰

Alternative and integrated infrastructure business models

Business models take into consideration different governance, but must also consider the wider infrastructure system that comprises (Figure 3):

- *physical artefacts* – includes the physical links, nodes and components of infrastructure systems such as roads, bridges, pipes and cables;
- *processes* – includes actors, institutions, management, regulation, protocols and procedures that govern the infrastructure over its lifecycle;
- *resources* – includes people, vehicles, water, electricity and data that are conveyed by the physical artefacts and the materials used in the construction of the artefacts; and
- *services* – such as warmth, mobility, sanitation, transportation, welfare services and communication that benefit a wide range of users.

Infrastructure is therefore the artefacts and processes of the inter-related systems that enable the movement of resources in order to provide the services that mediate (and ideally enhance) security, health, economic growth and quality of life at a range of scales.³¹ Moving beyond a narrow or solely economic view and distinct from the world of more conventional goods and services, an infrastructure

business model therefore describes how infrastructure systems create, deliver and capture economic, social and environmental values over the whole infrastructure life cycle.³²

Figure 3: A systems view of infrastructure

Source: iBUILD (2015: p5).

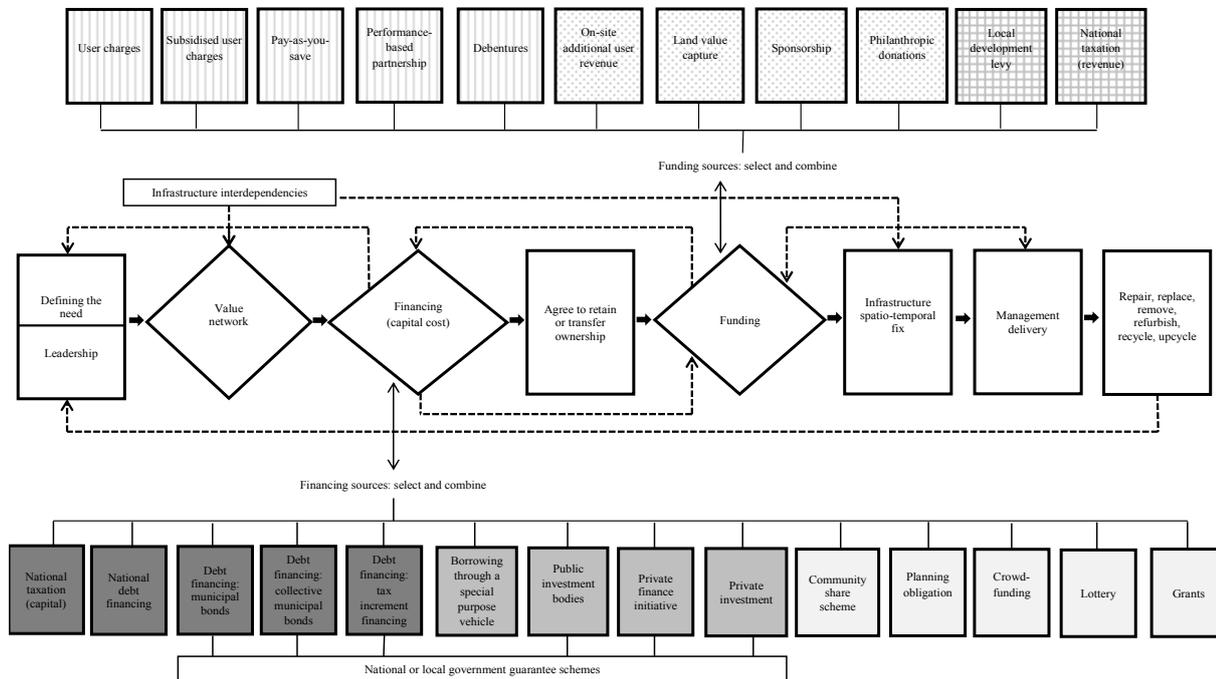

iBUILD has undertaken a review of over hundred UK and international local infrastructure business models, both traditional and non-traditional, across all infrastructure asset classes.³³ The business models are diverse. Value creation includes social, economic and urban regeneration outcomes as well as direct outputs in terms of service supply. International comparison has illustrated how the development of business models from niche to established mainstream models reflects the regulatory, political and socio-economic context (Bryson *et al.*, in review).³⁴ For example, the success of municipal decentralised energy supply in Denmark and subsidy-supported business models for local energy supply in the UK.

Figure 4: Conceptual Framework of Local Infrastructure Business Models

Source: Bryson et al. (in review).

Developing and implementing alternative approaches provides some benefits, but as noted above, our infrastructures are increasingly interconnected and some of the most promising opportunities are from thinking about delivering what people really require i.e. warmth, light, mobility etc. rather than electricity, gas, roads. This can help identify business models that deliver efficiencies across multiple ‘traditional’ sector boundaries. A rapidly emerging interdependence is between electricity and transport infrastructure – most notably uptake of electric vehicles (EVs). Coupled analysis of energy and transport systems models, has demonstrated that distribution networks could accommodate higher growth in electric vehicles than previous studies have suggested. Exploiting the geographic spread and different timings of EV charging can limit the impact on power infrastructure. Distribution network operators should collaborate with new market players, such as charging infrastructure operators, to support the roll out of an extensive charging infrastructure to make both networks more robust.³⁵

A well-established demonstration of the value of integrated infrastructure thinking applied to an industrial park – now an industrial ecosystem – is the closing of material and energy loops locally with integrated infrastructure in Kalundborg, Denmark. Since 1972, this industrial park has evolved from a single power station into a cluster of companies that exchange materials and energy for mutual benefit as by-products from one business are often inputs for others. For example, treated wastewater from a refinery is used to cool a power station which in turn provides steam for the refinery and a pharmaceutical plant. Surplus heat from the power station is also used for warming nearby homes and

³⁵ Neameh M, Wardle R, Jenkins A, Hill GA, Lyons P, Yi J, Huebner Y, Blythe PT & Taylor P (in press) A probabilistic approach to combining smart meter and electric vehicle charging data to investigate distribution network impacts, *Applied Energy*.

businesses. This has led to substantial annual savings of resources and costs – for example, a reduction in water consumption of 3.3mn m³/year, savings of \$15m from resource sharing and far larger savings by sharing infrastructure have been reported – highlighting how integrated infrastructure business models can produce substantial savings.³⁶³⁷

There are many potential ways of organising and regulating such interactions to create efficiencies. For example, in 1887 in Indianapolis, local civic leaders established a natural gas company as a Public Trust, with an aim to “create the greatest long-term benefit for customers and communities”. Today, the Citizens Energy Group owns and operates a large portfolio of physical infrastructure assets that deliver multiple services including energy, water and wastewater for 800,000 people and thousands of businesses in the Indianapolis area. This has provided community services that are entirely compatible with good financial management. The group was awarded a top rating (MIG 1) by Moody’s credit rating agency in 2014, a reflection, in part, of the strength of the company’s infrastructure business model.³⁸ By recognising the opportunities from the interdependencies of modern infrastructure, and explicitly designing this into our energy and other systems, this not only offers opportunity for alternative business models but also can be used to deliver flexible infrastructure systems that can enhance resilience.³⁹

Rail Investment Priorities in London & the South East

This document sets out the author's personal view on possible methods for infrastructure investment prioritisation, built on his experience having been involved in Signalling Supply, Network Rail Major Programmes, and now the Crossrail Programme.

The author has a number of feasibility schemes worked up in more detail, and would be more than happy to share his personal views on incremental investment opportunities targeted at maximising the use of existing rail corridors, if the panel should wish to pursue this.

How should Rail Investment in London be prioritised?

New major programmes, Crossrail, HS2 and Crossrail 2, creating new railway corridors, in the author's view, should be complemented with work prioritised on two bases;

1. Maximising the use of existing rail corridors, such that each two-track commuter corridor is optimised to carry up to 24 tph of up to 12-Car trains in each direction – i.e. to move up to on average 1,500 people x 24 trains per hour = 36,000 people per hour. Investing in existing corridors in priority to complement and integrate with the new major programmes such as Crossrail, HS2, and Crossrail 2 – e.g. improving the feeder networks to these new schemes.
2. Optimising the development of London by considering transport projects as an integrated part of planning permission for new property development, and not allowing existing railway corridors to be constrained. In fact using developer's to assist in the incremental expansion of existing railway corridors to complement the new major schemes.

Which existing railway corridors are constrained, and could be expanded?

Existing railway corridors are typically constrained by not having enough platform capacity to support maximum train volumes, and / or are unable to support longer trains. Examples include:

1. 2 track corridor (The DC Lines) alongside West Coast Main Line between Euston and Watford Junction, used by 6-car Underground trains, and short formation London Overground trains at less than 10 trains per hour in total. The proposed link from the Crossrail scheme at Old Oak Common onto the West Coast Main Line could be fed from services using incrementally expanded DC Lines, releasing capacity at Euston by diverting West Coast suburban services through into Crossrail train paths. A win-win for existing corridor usage maximisation, and an enabler for a more major Euston Master Plan (for example).
2. 2 track corridor (The East London Line) connecting the Brighton Lines to the North London Line, but only used by up to 5-Car London Overground trains, with stations that are too closely spaced, and a service frequency of around 15 trains per hour.
3. 4 track corridor between Loughborough Junction and Blackfriars, planned to be used by just 8 trains per hour for through Thameslink services (mainly 8-Car) from 2018, and having capacity only for 8tph of up to 12-Car terminating services at Blackfriars. i.e. 16tph in total for the 4-track corridor. (Constrained further south by Herne Hill and Tulse Hill approaches which could be changed through combined investment in development in these areas)
4. Brighton Main Lines (BML) corridor, serviced at East Croydon by 8 tracks toward London Bridge and London Victoria, and therefore should be capable of fielding up to 80 trains per hour in each direction (considering some services need to service West Croydon), however with only 6 through platforms at East Croydon, a 4-track railway corridor south of there, and a series of flat junctions and inadequate numbers of platforms for splitting and joining

further south, the BML is constrained to a probable maximum capacity of about 40 tph, or half its potential.

5. 4-track (but 3-track in places) North London Line corridor between Dalston Junction and Euston area, reserved for freight traffic to await paths toward Willesden, and a small number of short London Overground trains per hour passenger services. Could service diversion of traffic from the south end of the West Coast DC Lines corridor, linking in a Thameslink-style fashion through to the East London Line, and the Brighton corridor.
6. Great Northern lines terminating in Moorgate – could be extended through tunnels via London Bridge to link to the Bright Main Lines, therefore delivering another 24tph North South corridor opportunity. Tunnelling activity currently being undertaken in the Bank area might be quite easily extended in the immediate future to create new link required.

What is typical in terms of missed Development opportunities?

In London and the South East up until 2015, with the exception of the new Crossrail development, property development has included very little consideration of the transport opportunities that could be released for the railway corridor. Examples include:

1. The South Bank development at Blackfriars, in which a large residential tower block at the south station will for the next 30 to 50 years block any possibility of access to the remaining old railway bridge piers standing in the River Thames, which could have been used to provide two more terminating platforms for trains from the south arriving at the newly expanded Blackfriars Station. The new towers even include cut-out corners at higher levels for roof garden spaces, yet have no cut-out at bridge level for the railway.
2. The new development at Elephant and Castle has no provision for terminating platforms that could logically have provided a well-connected new southern London Terminus to augment Blackfriars sitting on one of the most underutilised 4-track railway corridors in London.
3. Finsbury Park residential development adjacent to the station on the ECML that is proven (December 2014 debacle) to require major upgrade to increase interchange connectivity.

How could incremental railway corridor improvements be sized and optimised to support new build railway projects?

Railway corridor improvements could be sized and optimised along the following broad rules:

1. Platforms could be extended generally to accommodate 12-Car trains on most suburban lines serving London
2. Where possible, terminal platforms supporting around 4tph per platform face, should be replaced by Through Connections. At Through Platforms with limited interchange, 24tph in each direction can be accommodated with modern rolling stock using ATO (similar to Thameslink Core Area, and Crossrail Central Operating Section), and 18tph in each direction if driven manually – therefore a huge increase on usable corridor capacity. At large scale interchange stations such as London Bridge and East Croydon, 18tph with ATO, and 15tph manually driven would be more supportable timetable planning rules.
3. Railway corridor incremental improvements could be optimised to support and divert commuter numbers away from the places that are being developed in the new build railways – e.g. diverting traffic away from Euston while Crossrail 2 and HS2 are built. I.e. a similar approach to that used when diverting Thameslink traffic from London Bridge to Blackfriars, but on a more effective and larger scale.

4. The application of Digital Railway techniques to increase capacity (as used on the Thameslink Core Area to give +4tph under ATO / ETCS) should only be considered feasible where successive flat junctions and constrained platforms have first been addressed. E.g. with successive flat junctions on the BML for example, it is the author's personal view that it is not possible for Digital Railway techniques to make a large increase in the overall train flow rates, as all that is achievable in practice is bunching up between successive flat junctions and stations.

Examples of incremental improvements for Brighton Main Line corridor:

The following scenario of prioritised incremental railway corridor improvements to support and maximise the usage of the Brighton Main Line gives one example of the sort of schemes that the author would propose:

1. Provision of 6 new platform roads underneath the existing East Croydon Station served exclusively by the London Bridge corridor. i.e. existing above-ground station serves the Victoria corridor only, and underground serves London Bridge.
2. South of East Croydon station, widen the railway corridor to provide for the fly-down connections to the new underground station at East Croydon, thus creating a 6-track approach from the south to both upper and lower platforms. Remodel the junction south of South Croydon station, so as to provide a 50mph grade-separated junction to the East Grinstead lines, and two lines sweeping alongside the allotments to provide a 6 track approach through Purley Oaks, south towards Purley.
3. At Purley, provide 6 platform faces and a 4-track railway corridor toward Coulsdon South for slow-line services, with no platform faces on the Fast Lines.
4. At Coulsdon South provide a 4-track railway corridor in place of the current 2-tracks through the station; 2 non-stopping relief lines in the centre, and moving the platforms to the outside of the corridor. (Fast lines remain unchanged). Relief lines converge just south of the station to run through the deep cuttings and tunnel – i.e. 4-track corridor remains through towards Merstham and Redhill.
5. At Merstham, expand the station to have four platform faces on the Slow Lines, utilising the unused land currently sitting between the Fast and Slow Lines.
6. At Redhill, expand the station to have five platform faces – a new Tonbridge platform to the east of the current station built over the current post office depot, as well as the planned Platform 0 on the west of the station serving the Reigate lines.
7. Provide a grade-separated junction between the Fast and Slow Lines just south of Redhill, before Earlswood Station. Also provide a 12-Car central turn-back platform between the Down Slow and Up Fast at Salfords station, for use during perturbation.
8. North of Gatwick Airport provide a wider northern throat with a 6-track approach, and grade-separated cross-over to allow routing of trains between the Fast and Slow lines to and from the London direction.
9. At Three Bridges, provide 6x12-Car platforms, re-building the currently disused western-most platform face for Up trains from the Horsham lines. Move the siding north of Three Bridges to the centre of the layout between the Fast and Slow Lines to provide a turn-back facility for cross-corridor Depot moves, and provide a grade-separated junction between the Horsham lines and the Brighton Lines north of the turn-back siding.
10. Extend the East Grinstead lines south through the Heritage Bluebell Railway corridor, to Horsted Keynes, and then re-build the dismantled railway between Horsted Keynes and Haywards Heath to re-join the Brighton Main Line. This will provide a cheaper alternative to

BML2 proposals via Lewes, and even allowing for heritage railway traffic, a 2-track corridor extension from East Grinstead could easily support the additional trains envisaged to flow to Brighton in the BML2 scheme. In effect this creates a 4-track railway corridor as far as Haywards Heath on the Brighton Main Line, with 2 tracks via Balcombe and 2 tracks via East Grinstead.

11. Widen the railway corridor to 4-tracks south of Haywards Heath to Wivelsfield, and grade-separate Keymer Junction and remove the level crossing on the Lewes lines by lowering these tracks to pass under the road.
12. While leaving just two tracks through the corridor via Burgess Hill and Hassocks, reinstate the fourth platform at Preston Park, and provide a grade-separated junction north of this station, thus allowing trains from Hove to exclusively serve the 2 western-most platforms, and trains to and from Brighton to exclusively serve the 2 eastern-most platforms.
13. Widen Brighton station by providing 2 new platforms on the eastern-most side where the multi-storey car park is sighted today, providing an increased car-parking capacity below the new platforms.
14. Widen the Brighton throat to allow more flexible approaches, to maximise use of the improved 2-track corridor toward London.

Summary

This document gives a personal view of the author as to how investment in incremental schemes to release capacity in existing railway corridors might be used in an incremental way to feed and integrate with the new major programmes that are proposed in the London Area such as Crossrail and Crossrail 2, as well as the southern end of the HS2 programme.

While the examples quoted above obviously do not work in isolation, the author has thought through a pattern of works and outline feasibility plans which if the panel had time, and was minded, he would be very pleased to discuss in more detail.

It is hoped that sufficient detail has been included herein to give visibility of an overall philosophy that could be utilised in planning and prioritising investment works.

[contact redacted]

WESTLINK : PROPOSED NEW CROSS-CAPITAL ROUTE

London has historically been served by more main line terminus stations than any other major city, and this has had, and continues to have, huge implications for cross-city connectivity. The major congestion and delays suffered by passengers as they are forced disembark from main line train to already packed Tube train have provided the impetus for development of new cross-city rail routes such as Thameslink, the East London Line and CrossRail (currently under construction). Collectively, these cross-capital lines will have a transformational effect upon London's rail connectivity, and planning is already in progress for the next project, commonly known as CrossRail 2.

CrossRail 2 has grown out of the original proposal for the 'Chelsea-Hackney Tube', first put forward in the 1970s. It is likely to comprise a 'heavy rail' route linking the South Western Main Line near Wimbledon with the West Anglia Main Line near Clapton, possibly with a branch towards Alexandra Palace. The Wimbledon - Clapton trunk route will require around 28km of tunnel, and 9 new deep-level underground stations; a project cost of £15 billion has been predicted. The impetus for CrossRail 2 has recently increased, owing to the congestion likely to arise with the projected development of Euston as the London terminus for HS2. With only the Northern and Victoria Lines available to disperse incoming passengers, the projected alignment of CrossRail 2 has been amended to include a new stop at Euston.

Although CrossRail 2 will undoubtedly bring major connectivity benefits for London, it should not be regarded as the only option to relieve congestion at Euston, or to improve cross-city connectivity on a south-west/north-east axis. This paper puts forward the alternative 'Westlink' proposal for a core route linking Waterloo, Charing Cross and Euston that will deliver far greater connectivity than CrossRail 2, for a fraction of the tunnelled length (and therefore cost).

CLC1 : PROPOSED 'CROSSRAIL 2' CROSS-CAPITAL ROUTE

The 'regional' heavy rail option for CrossRail 2 is shown superimposed onto central London's local rail network. All the length shown on the plan will be in deep-level tunnel, with underground platforms at all stations. As previously noted, around 28km of tunnel (twin bore) and 9 underground stations will be required.

CLC2 : PROPOSED 'WESTLINK' CROSS-CAPITAL ROUTE

Westlink's core section - comprising an elevated connection from Waterloo Station to Charing Cross river bridge, an underground route from Charing Cross to Euston, and a further northward tunnelled extension to Gospel Oak - will allow the Richmond-Waterloo, Bromley-Victoria (via the redundant Eurostar curve at Nine Elms) and Orpington-Charing Cross lines to connect to the Euston-Watford and Gospel Oak-Barking lines. A link to the West Anglia main line at Tottenham Hale will effectively replicate the regional functionality of CrossRail 2. 6 main line routes will be connected, for a total tunnelling requirement of less than 5km.

CLC3 : 'WESTLINK' PROPOSAL INTEGRATED WITH OTHER LOCAL RAIL SCHEMES

Westlink will be fully integrated into London's local rail network. Interchanges are proposed at Queenstown Road / Nine Elms (also serving the projected Nine Elms development), at Kentish Town West (for North London Line), at Harringay (for Thameslink Great Northern), and at Harlesden (for CrossRail extension to Chiltern).

CLC4 : WESTLINK & CROSSRAIL 2: ROUTEING COMPARISONS

The potential networks facilitated by CrossRail 2 and Westlink are shown together, to allow direct comparison to be made. On the basis of the much reduced length of new tunnelled construction, a notional cost estimate of around £5 billion might be made for Westlink, perhaps £10 billion cheaper than CrossRail 2.

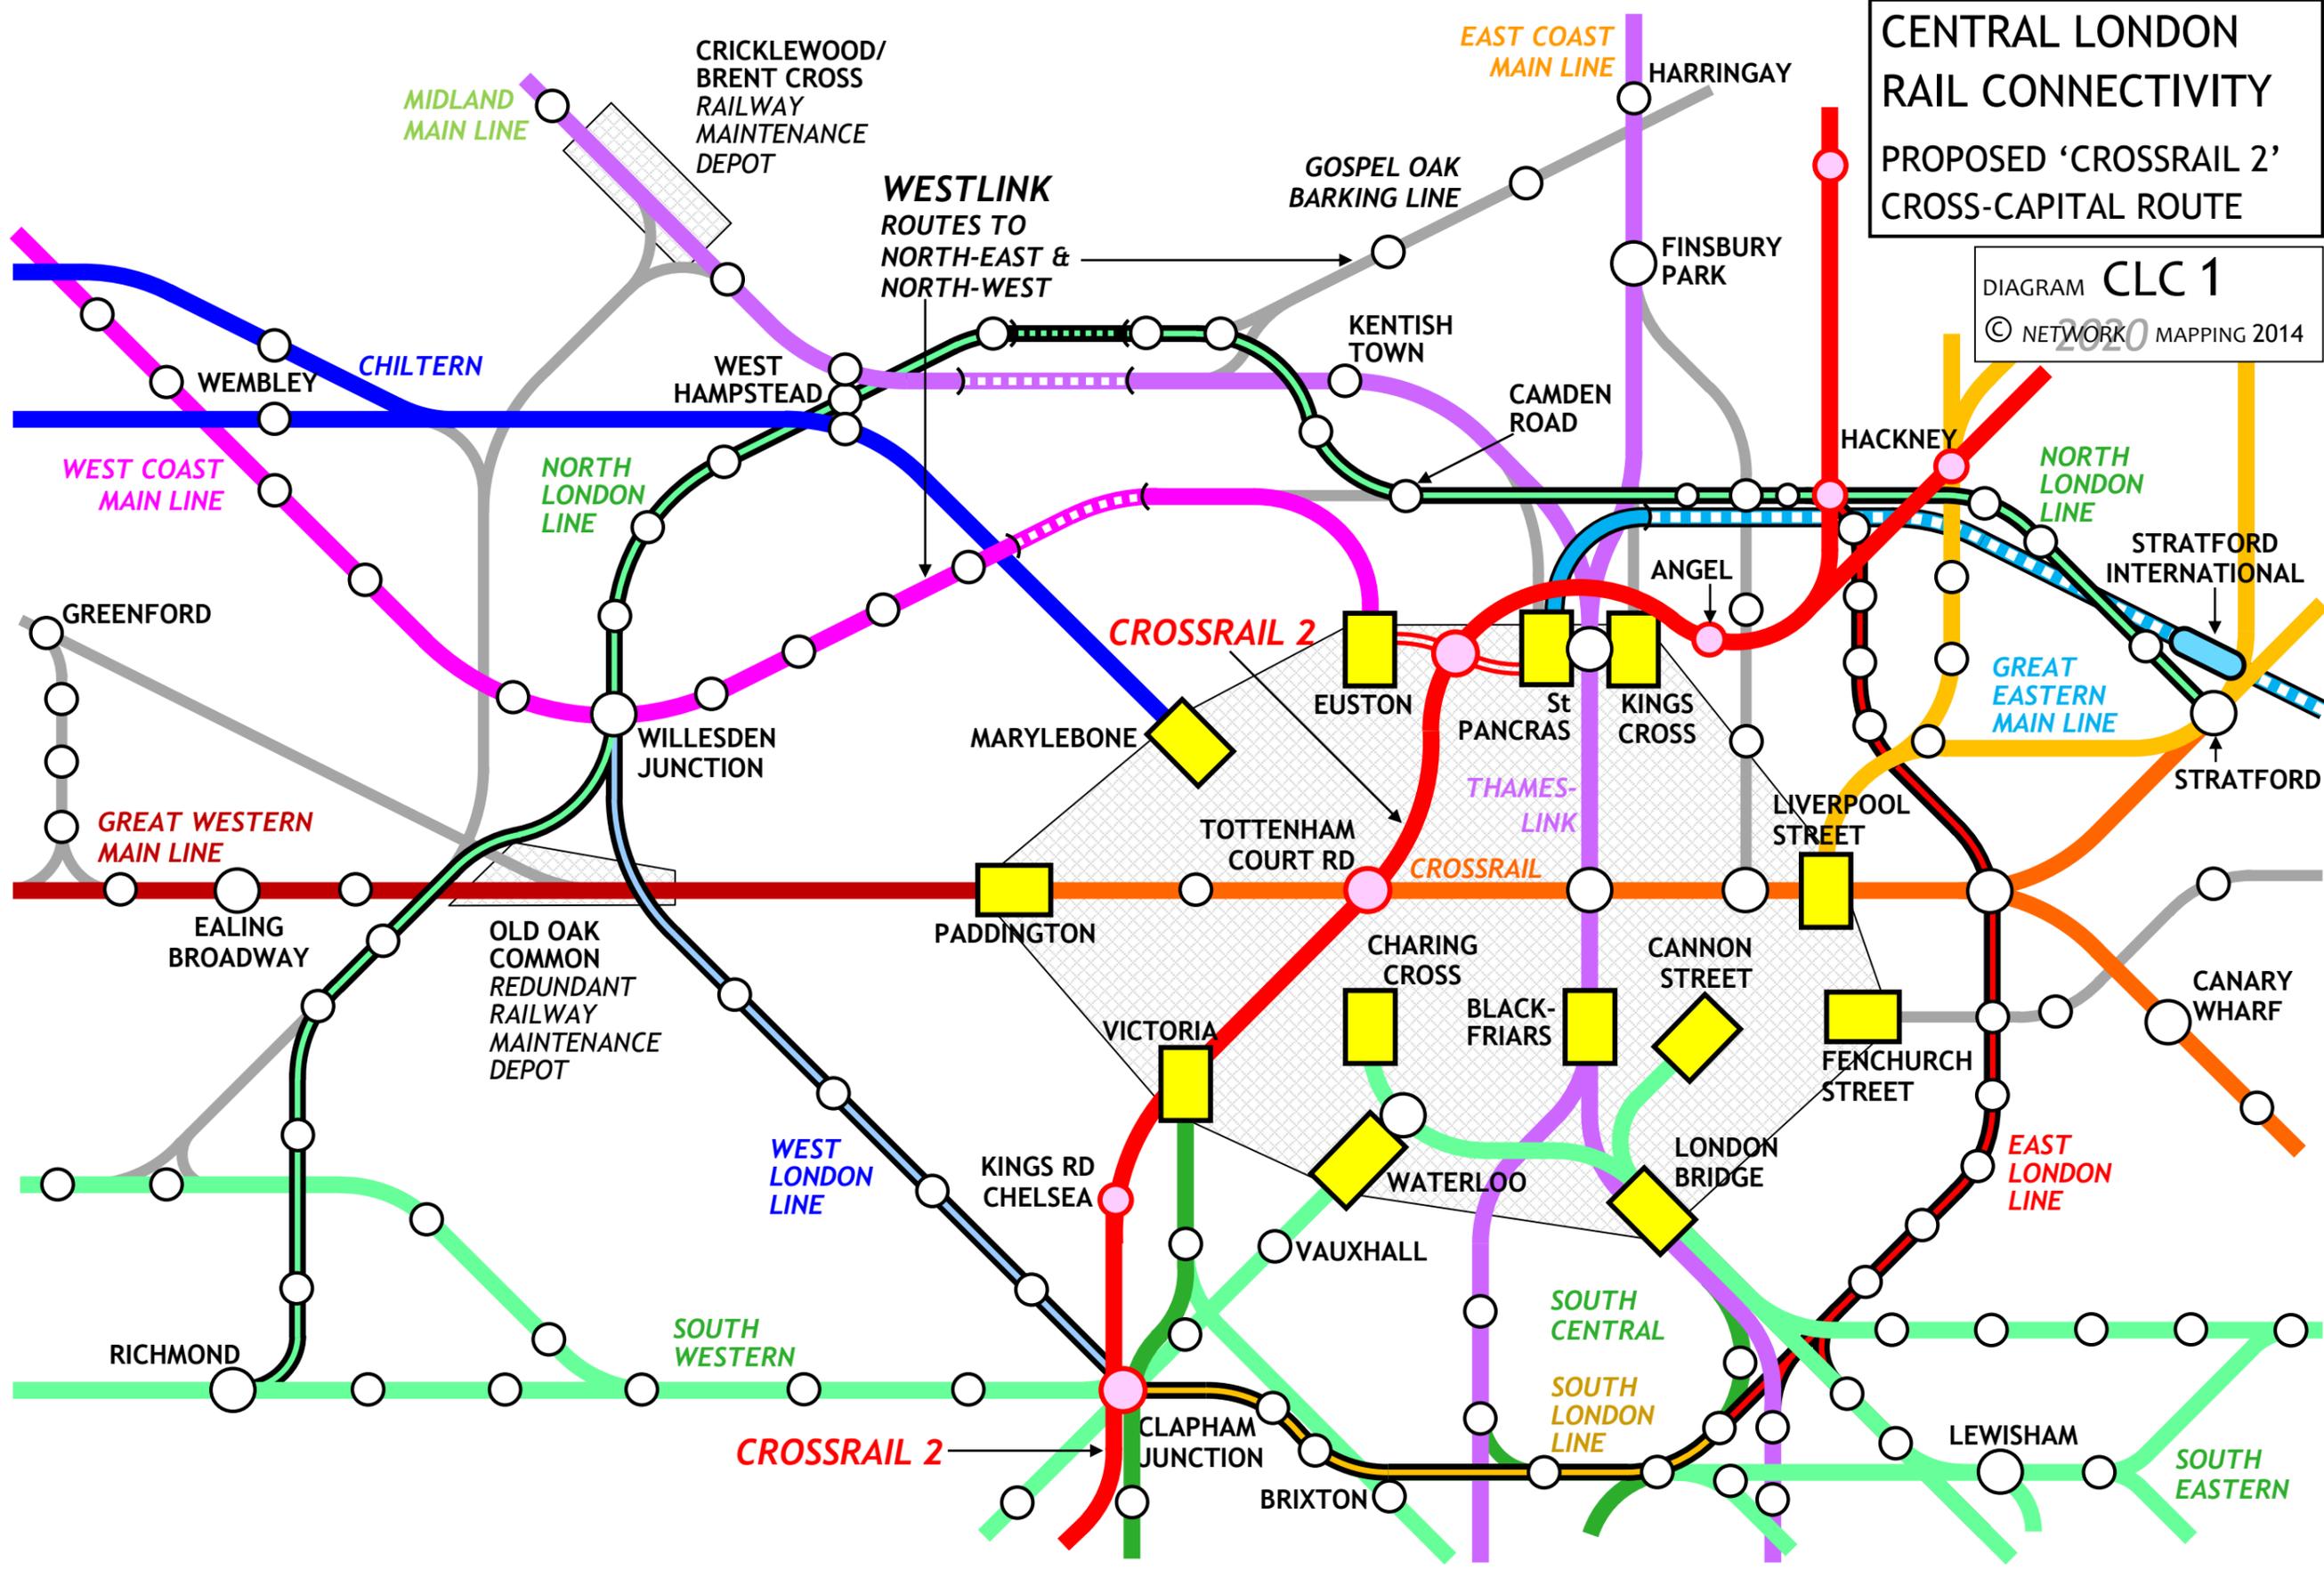

CLC5, CLC6, CLC7 : DETAILED PLANS SHOWING WATERLOO-CHARING CROSS ELEVATED ALIGNMENT

The elevated route between Waterloo and Charing Cross is crucial to the Westlink scheme. The route will enter Waterloo Station via the currently redundant Eurostar terminal, with tracks and structure realigned to continue north on viaduct to connect to the existing line into Charing Cross. The proposed alignment trims the Shell Centre, and this will require major modifications to curve the frontage to align with the new railway. Most of the length of Charing Cross station trainshed must be devoted to the ramp necessary for the new northward tunnelled route to dive below ground level; instead, the Westlink platforms at Charing Cross will be established largely on the river bridge, with major structural modifications required. This presents an opportunity for a direct stair/escalator link to the better-connected Embankment Tube station.

The case for investment in Light Rail in London

[contact redacted]

About the author: [redacted] is a transport analyst. He worked at the Confederation of Passenger Transport (CPT), representing light rail and tramway operators. Before that, he worked on public transport at the Transport Research Laboratory, including a study of the light rapid transit and urban development and on the effects of rail investment in Tyne and Wear and Glasgow. Since retiring from CPT in 2012 he has continued to work with UKTram, and represents the UK on a EU-funded study of urban tram safety in Europe.

The National Infrastructure Commission has called for evidence on three major national challenges:

- Improving connectivity between cities in the north of England,
- Large scale transport infrastructure improvements in London,
- Improving how electricity demand and supply are balanced.

This paper addresses the second of these challenges and examines the case for investment in light rail and modern tramway systems in London.

What light rail can do

Light rail, and in particular a street-running modern tramway, is a modern transport mode which uses vehicles which run on rails but which are lighter than traditional rail vehicles. This enables higher acceleration and deceleration, steeper gradients and sharper curves than on a railway. Hence stops and stations can be closer together, providing a better urban public transport service. The capability of running in the street, either on its own right of way or mixed with road traffic, means the infrastructure can be lighter and less intrusive, requiring less in the way of bridges and tunnels which, of course, makes it less expensive. Light rail is normally driven by electricity, making it non-polluting at the point of use and able to use power generated from sustainable sources. Also, modern trams generally allow level boarding, which makes boarding easier for people with disabilities.

A modern tramway can carry between 4000 and 10,000 passengers per hour in each direction (pphd). This means it has a much greater capacity than a bus service, which is limited to about 3000 pphd by the need to stop, start, load, unload, accelerate and decelerate. In a large city, buses do not provide adequate capacity.

Several cities in the British Isles, including Manchester, Sheffield, Dublin and Edinburgh, have installed modern tramways. They are successful at carrying large numbers of passengers, attracting car drivers, and promoting urban regeneration. In London, the tramway in Croydon and the Docklands Light Railway (which does not run on-street but is classed as light rail) have both produced similar benefits.

The case for light rail in London

In this paper we look at the scope for light rail investment in London.

Currently, London is experiencing a great deal of investment in its rail services. Crossrail is being built and will carry passengers between Paddington in the west and Liverpool Street in the east from 2019. Crossrail 2, linking the north-east and south-west, is under development. Extensions are planned to the Bakerloo and Northern lines, and the Docklands Light Railway undergoes continuous development. In recent years, sections of underused rail lines have been linked together to form the Overground network, serving mostly circumferential routes. These improvements have been, or have the potential to be, very successful.

Of course, rail improvements are enormously expensive, and, as this paper shows, do not serve all needs. We believe that public transport investment can also be effective at a more local level, providing short-distance, readily accessible, public transport both in central London and in district centres in the London area.

Why London needs efficient rail transport

We start with the observation that London is a large city. This is obvious, but London is by far the largest city in the United Kingdom, and can be classed as a world-class mega-city, one of only two in Europe (Paris being the other).

Large cities depend on rail transport to bring people and goods into their city centres. One has only to see what happens when rail services in London are disrupted by strikes or weather: people cannot get to work and the city could not operate for long. Of course, London already has a good many rail lines. The Underground brings 3 million people into the capital every day, and the suburban railway brings another 1 million. In the course of a year, the Underground carries more than 1 billion passengers, as many as the whole of the national rail network.

Large cities also depend on rail to carry passengers within their city centres. The city centre of London – defined broadly as Zone 1 or the area within the Circle Line – is too large for walking. This makes London different to other large cities such as Birmingham or Manchester, where it is possible to walk across the centre in 15 minutes or so. London needs an efficient public transport network within the city centre.

Central London is of course served by the Underground, but even with the fairly dense network of lines in the centre, it does not serve all the major corridors. Furthermore, the time taken for a passenger to descend to the platforms and back to the surface makes the Underground inefficient for short journeys. Hence, many central area journeys are made by bus, and there are many intensively-used bus routes. But buses get delayed in traffic, and on some busy corridors they struggle to cope with the demand, as a bus corridor cannot operate at more than about 30-40 buses per hour.

Another feature of the size of London is that it encompasses a number of district centres which are sizeable centres in themselves. The London Borough of Croydon claims that if Croydon were not “embedded” in London, it would be Britain’s 8th largest city, surpassing Coventry and Wakefield. It is not alone; there are other

district centres such as Stratford or the Richmond-Kingston area which could make a similar claim. Such centres need their own public transport networks, and the density of their transport corridors means that buses alone will not suffice.

We would argue that there are busy corridors, both in central London and in district centres, which would be better served by a modern tram service, with vehicles that can carry up to 200 passengers and, given the right priorities, can provide a shorter end-to-end journey time. A modern light rail or tramway system would provide a more efficient transport system, less costly than Underground or suburban rail improvements, but able to cater for busier corridors than buses can.

Suggestions for where light rail should be considered

Where would such corridors be located? It would of course be for Transport for London to look at current flows, do the modelling and identify corridors for improvement, but we make some suggestions here.

Light rail in Central London

Firstly, in central London, the corridor from the **Euston-Kings Cross area to Waterloo** station is one of the busiest, but it is not well served by the Underground. A few years ago there were well-developed plans for a tramway called the Cross-River Line to serve this corridor. It would run from Waterloo, across Waterloo Bridge, and then follow Kingsway and Southampton Row to Euston before turning right along Euston Road to St Pancras and Kings Cross. North of Kings Cross, the line would serve Camden Town, and south of Waterloo it could be extended to Peckham or to Clapham Junction, relieving the overcrowded rail lines into Waterloo. The line was forecast to carry about 70 million passengers per year, more than any other tramway in Britain. **We recommend that the plans for the Cross-River Line should be re-instated.**

Secondly, **Oxford Street** has been identified as one of the busiest corridors in London. It is served by many bus routes, but there are so many buses that progress is slow – very often, it is quicker to get off the bus and walk. It is also served by the Central Line and will be served by Crossrail, but with only 4 Underground stations and 2 for Crossrail this hardly constitutes an efficient local service. A tram service between, say, Holborn and Marble Arch would provide better connectivity for Oxford Street shoppers, and it could be extended to Paddington to serve the mainline terminal. One drawback to the earlier Oxford Street tram plans was where to locate a depot, but that could be accommodated by integrating the Oxford Street tram line with the Cross-River Line and using a joint depot south of the river or in the Kings Cross area. **We recommend that the plans for an Oxford Street line should be re-examined.**

Thirdly, there are no Underground lines serving travellers between **Victoria and Paddington**, via Hyde Park and Marble Arch. Another heavily used bus corridor is that between **Victoria and the City**, via Parliament Square, Trafalgar Square and

the Strand. These corridors could benefit from light rail investment. **We recommend that TfL should examine the case for light rail investment on these and other densely-trafficked routes in central London.**

District centres in London

Among district centres outside central London, Croydon and Stratford are just two examples where investment in light rail could improve local transport. Neither is a rich area, and there are many people in these areas who are not well-off, or are even deprived. Their lives are far removed from those of the well-paid people who work in the City or shop in the West End, areas which they seldom visit. People in east and south London depend on public transport for access to employment, shops, schools and leisure facilities, and businesses depend on it for their employees and customers. Investment in public transport would be beneficial on many levels.

We have already identified **Croydon** as a centre which requires good public transport. There is an existing tramway in Croydon which links Addiscombe and Beckenham Junctions to Central Croydon and on to Wimbledon, carrying large numbers of passengers. **We recommend that the various plans for extensions to this system, including one to Crystal Palace, should be pursued vigorously.**

In east London, **Stratford** is a rapidly developing area with a large shopping centre. It is already well-linked to central London and other centres by public transport, with suburban rail, two Underground lines and two Docklands Light Railway lines. But Stratford depends heavily on buses in several corridors, notably eastwards along Romford Road and to the north-east towards Leytonstone. **We recommend that these corridors serving Stratford be examined with a view to installing light rail lines.**

In addition, there are other district centres within the London conurbation which have similar needs. Examples could include the Tottenham-Wood Green area, the Wembley area, and Kingston-upon-Thames and Richmond where a tramway could be developed to link with Croydon. **We recommend that all such areas which are currently served by heavily-used bus routes should be examined for possible light rail investment.**

Conclusion

In this paper we have suggested some areas, both in central London and in other centres within London, which should be considered for transport investment. Grand projects such as Crossrail and Underground extensions are fine, but they are expensive and take many years to develop; also, they do not necessarily provide the local accessibility that public transport needs. A modern tramway can provide high capacity transport which is safe, reliable and readily accessible to passengers, at a much lower cost than heavy rail or Underground investment. **We recommend that TfL examine the options described in this paper and others where light rail would be beneficial.**

Future investment in the London's transport infrastructure

Submission from: [contact redacted]

I do not wish to comment directly on future investment in the London's transport infrastructure.

That said, I do wish to **highlight the long term neglect of land drainage maintenance that leaves transport (and other) infrastructure liable to and at a steadily increasing risk of flooding.**

Very briefly.....

When the Environment Agency took over from the National Rivers Authority in the mid 1990's they disposed of the River Thames dredgers upstream of Teddington. Disposal facilities were closed and dredger operators dispensed with.

The £110m MWEFAS flood alleviation scheme was then constructed. On first use in 2003 the Jubilee River suffered severe structural damage. In spite of £5m in repair costs it is unable to convey its design capacity and is still falling apart today. The Thames downstream of Windsor flooded badlyin 2003 and twice in 2014.

The Environment Agency's current River Thames Scheme flood alleviation project is costed at £302m at 2009 prices. I have no doubt that this will be a £1bn if the project gets completed in 2025.

In my opinion this project is flawed in the same way that the Jubilee River was. The Environment Agency is unable to learn!

The really big issues are.....

- 1) The EA has no legal duty to maintain or improve the conveyance capacity of designated main rivers – so it doesn't.....
- 2) There are approximately 100 blocked flood arches upstream of Teddington – used as offices, workshops, warehouses etc. These reduce the discharge capacity of the system.
- 3) I have explained the problems to the EA and stated that..... if they implement the River Thames Scheme..... if they are lucky they will only flood Staines. If they are unlucky they will flood London.

Please feel free to contact me for further details

LONDON'S TRANSPORT INFRASTRUCTURE

Contribution to

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London – on road, rail and underground – including, but not limited to, Crossrail 2.

Introduction

In 2018 there will be two major infrastructure events, the opening of Crossrail and Thameslink, the biggest such schemes since the Channel Tunnel and Rail Link, and the upgrading of the West Coast Main Line.

The next major project to follow these is HS2. Due to open between 2026 and 2033, this dwarfs the other schemes. It will provide fast interconnection between many of the major cities of the Midlands and northern England. It will also free up urgently needed capacity on the existing main rail lines, rapidly increasing passenger numbers and freight.

The objective now must be to fully utilise the potential these projects have created. There are many transportation needs to be met, constrictions to be alleviated and pollution to be reduced. With tight budgets, integrated forward looking infrastructure planning is the only way to proceed.

The Elephant in the Room

Looming over much of Greater London's infrastructure forward planning is the lack of a decision on an upgraded or new hub airport capable of meeting the long-term needs of long distance travel; the elephant in the room.

The Airports Commission have recommended adding a new north west runway at Heathrow adequate to meet demand up to 2050. The Government have deferred a decision accepting these recommendations until a proper study of the impact of expansion on air quality and noise levels. Aircraft noise pollution already inflicts unacceptable misery on hundreds of thousands people in London who have repeatedly been told that new quieter aircraft will bring relief; the Airports Commission report shows otherwise. Even more serious for Heathrow's expansion is air quality. If studies show it is likely to exceed legal limits, then expansion cannot go ahead.

The Airports Commission admit their alternative solution, expansion at Gatwick, will not result in an adequate international hub for UK's economic future. The only real alternative to an expanded Heathrow, the one the Commission rejected, is the Thames Estuary site on the Isle of Grain. This was presented as having an unmanageable capital cost, partly due to the need for extensive new transportation infrastructure. This needs to be examined objectively in relation to the needs of other proposed developments in the same area.

Thames Gateway Regeneration Zone

The Regeneration Zone stretches forty miles along the estuary from Canary Warf in London to Southend in Essex and Sittingbourne in Kent. This concept is aimed at expanding London's economic activity along the Thames Estuary encouraging business enterprise, employment and new housing by providing improved infrastructure. It has succeeded beyond anyone's expectation in the Docklands at the western end of the Zone. It is undoubtedly in need of an employment catalyst to spread it eastward, together with improved rail and road links such as the extension of Crossrail eastward from Abbeywood and the construction of a Lower Thames crossing proposed to alleviate the lack of capacity at the Dartford Crossing on the M25. This will also overcome the barrier to economic activity between Kent and Essex.

London is desperately in need of additional affordable housing, either within the Greater London Area or outside with adequate commuter links. Thames Gateway Regeneration Zone can offer this once Crossrail is completed and the south spur extended.

The Employment Catalyst

It is hard to imagine a more effective catalyst to set in motion the regeneration of the Thames Estuary than the construction of a new hub airport on the Isle of Grains. There is only need for one hub to serve the UK and for a new one to succeed economically, the closure of Heathrow is a prerequisite. Employment priority would be given to Heathrow staff who are prepared to move near to or travel to the new airport. It can be anticipated that well in excess of 50,000 new jobs will be available for people living in the regeneration zone. A lower Thames crossing would spread the benefits to Essex.

Lower Thames Crossing

The Dartford Crossing on the M25 is already operating close to capacity. Studies have been carried out to compare providing extra capacity at Dartford with two alternatives further down the Thames. The appraisal report "Review of Lower Thames Crossing Options, April 2013" discarded the middle route. The lower route leaves the A2/M2 junction east of Gravesend and crosses the Thames east of Tilbury joining the M25 between junctions 29 and 30. Improvements to the A229 linking the M20 and M2 were also considered but were found to be very expensive for such a short road. The crossing and M20-M2 link are presently being studied on its own merits. In the event that the hub is to be constructed on the Isle of Grain, consideration should be given to building the link further west where it could also act as the main access route to the airport for airport traffic originating west of junction 5 on the M25.

Consideration should also be given to a combined road and rail crossing structure, although a separate rail tunnel will probably prove more economical.

Airport, Rail and Road Access

Heathrow has grown over the years with poor rail access, encouraging unacceptable levels of road usage, contributing to air pollution and congestion on roads leading to the airport. Closure of Heathrow would help solve both problems.

Infrastructure already in place would mean that rail links to a new estuary airport can be world class with little extra investment cost to be set against the airport alone.

- The extensions of Crossrail beyond Gravesend would provide a high capacity frequent service. Travel times of under one hour from Old Oak Common and ten minutes less from Tottenham Court Road would be expected.
- An airport link to HS1 would allow provision of express services in under half an hour on the “javelin” trains to Kent from St Pancras and Stratford. These trains are presently running 6 carriages whilst 12 are allowed for in the train design and platform length. The track has been built to UIC GC loading gauge which allows for double-decker trains which are being increasingly used on the Continent. There is definitely adequate latent capacity to meet the need for express travel to the airport. The two halves of the “javelin” trains can be separated automatically allowing even more flexibility.
- Of equal importance to the London links is the possibility to establish fast rail travel to other parts of the UK. With HS2 in place, many of the major cities of the north, Midlands and the west can be provided with a through service to the airport in under two hours. The main capital expenditure will be a direct link between HS2 and HS1. With this in place, up to four HS2 trains per hour could bypass Euston and stop at Stratford for Docklands, at Ebbsfleet to connect with Eurostar services, and terminate at the hub airport. There would be no loss of capacity to serve London, as passengers for other destinations could change at Old Oak Common onto Crossrail, avoiding poorly connected Euston. Passengers from the west would join at Old Oak Common.
- It has been assumed that HS1 has a maximum capacity of 16 paths per hour in both directions between St Pancras and Cobham before the Medway crossing. Of these, six could be allocated to Eurostar, six to “javelin” services and the remaining four to HS2. Beyond Cobham, there would be a lot of extra capacity allowing for freight services which would have to join the Kent lines into London, or use a new rail link to Essex if one is built. This would tie in well with the new London Gateway Port and Logistics Park already in use downstream of Tilbury. There would also be capacity for trains from the Continent to what could become one of the world’s best airports for range of international connections.
- The rail route to Waterloo, in use for Eurostar services before Phase 2 of HS1 was built, could be reinstated to provide an adequate semi-fast service to Waterloo. There is an extra-ordinary provision in the costs presented in the “Airport Commission’s Inner Thames Estuary Airport Summary and Decision Paper, September 2014” for a new express rail service from Waterloo via Barking Riverside bringing their enhanced rail package provisions to £26.9 billion! This, together with estimated road improvements of up to £17.2 billion, adds a £44.1 billion infrastructure bill to the airport development without any attempt to discuss what would be built in the without airport scenario. This approach to dismissing an apparently unwanted project would surely be more in place in a script for Yes Minister than a document intended to decide the long-term provision of hub airport capacity in the UK.

- The above rail access would be more than adequate to support a hub airport with capacity to meet demand beyond 2050. The demand on road access would be reduced to a much more manageable level than at Heathrow. A further route could be added if a rail tunnel is built at the Lower Thames Crossing. The north-eastern Crossrail line could be connected to the airport by a line from Romford or Brentwood. This would provide additional capacity but, even more important, would add resilience to rail access when maintenance is carried out on other lines.
- Thameslink, the proposed Crossrail 2 and the existing rail network could play an important part in providing acceptable linkage to the airport from the zone outside Greater London.

HS1 – HS2 Link

An HS2 Phase 1 report, Review of HS2 – HS1 connectivity and Rail Links to the Continent – November 2015, is now available. It suggests numerous tunnel alternatives that could connect the two lines, plus several involving passengers leaving HS2 trains at Euston and walking or being carried on travellers to St Pancras.

The only realistic solution which meets the simple requirement for HS2 trains to join HS1 and terminate at the airport is a variation of option R6. The pair of rail tunnels from Old Oak Common would bifurcate near Chalk Farm, with one pair to Euston and the other pair joining the HS1 line north of St Pancras before it enters the tunnel to Stratford. The bifurcation would be of a similar design to that already built on Crossrail near Stepney Green. The report rightly points out the difficulties this solution would meet at the St Pancras end, but probably no more difficult than those recently solved by Crossrail. The Thameslink canal tunnels completed recently under St Pancras should provide useful information on shallow tunnelling in the area.

Closure of Heathrow

The closure of Heathrow is inevitable if a new hub airport is built. Airport staff will be seriously affected if they are not able to move to the new airport unless good transport links are available. A grade separated interchange between the Great Western lines/Crossrail and HS2 at Old Oak Common would serve this purpose for a few years until HS2 and HS1 lines are fully utilised.

Many businesses have located near Heathrow to take advantage of the freight services it can provide. A freight consolidation and distribution centre should be retained there with a fast and frequent rail freight service established, if possible, to reduce road haulage between the two sites. Heathrow airport site, with its forthcoming Crossrail services, will be a prime site for commercial and residential development.

Overview

The delay in deciding whether to proceed with a third runway at Heathrow is a major impediment to preparing a long-term plan for London's transport infrastructure. However, this review suggests that most of the components needed to support a change in location of UK's hub airport, if it occurred, are already being actively progressed to meet other identified needs.

The only scheme warranting immediate action is the HS2-HS1 link tunnel. This should be studied in detail so that it could be built with HS2 Phase 1. Any other approach would be very short-sighted and hugely disruptive for adjacent rail services.

There is real need to reduce the strain on commuter trains into London and improve access to areas of more affordable housing which is rapidly disappearing from Inner London. Crossrail 2 can play a major part in this at a high price. This is inevitable for any scheme requiring long tunnels under London. A useful intervention would be a study covering the Greater London area and commuter links to identify which routes could carry double-decker trains without excessive infrastructure rebuilding.

The author regrets only noticing the call for submissions shortly before the closing date, otherwise a more polished presentation could have been made.

[name redacted]

Dear Sirs,

I consider that one of the aims of the NIC should be to link projects that can support each other or generate synergies, create economies of scale, or pursue other national or regional priorities as a byproduct, thus "killing two birds with one stone" and leveraging funding in the best possible way towards desired outcomes.

In particular, I am anxious that all future tunnelling projects should be linked with land reclamation schemes, so as to maximise the land available for other uses that are needed, including housing development or other infrastructure.

I would draw to your attention that spoil from the British sector of the Channel Tunnel was used to create an extension to the cliffs of Kent known as Samphire Hoe, which is now a unique habitat, nature reserve, public open space and tourist attraction.

Given the pressure on land for housing, green infrastructure, food production, energy infrastructure etc., I consider it vital that spoil from Crossrail 2, a Trans-Pennine Tunnel, and other similar schemes be used for seabed land reclamation in or near to existing cities or towns so as to create new footprints for high-value coastal housing schemes with sea views. The proceeds of sale of such housing would subsidise the original project, and it would help to meet the housing imperative without taking any greenfield land.

Yours faithfully,
[redacted]

Response to Infrastructure Commission Call for Evidence: Questions relating to Greater London:

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Lack of housing, especially affordable housing within reasonable travel distance of employment and services.

Dependence on the private car, especially away from Inner London and, resulting from this:

The concomitant wasteful use of land (for roads and parking) that should otherwise be used for housing, other beneficial uses, biodiversity and flood mitigation;

Lack of opportunity (and safety) for walking, cycling and public transport, all of which would contribute to public health through less obesity, better air quality and less premature morbidity and mortality with significant effects on the costs of health care.

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?

There have been far too many reports that have been shelved (e.g. the two immediate Post-War railway reports following the Abercrombie Plans, of which only a few fragments have been built, the proposals half a century ago for what is now Crossrail 1, the Bakerloo Line Extension, expected in the 1950s, and the inordinate delays on Thameslink "2000"). IMMEDIATE starts should be made on

- The elimination of bottlenecks on the radial rail network (e.g. E Croydon, Welwyn Viaduct, Clapham Junction and Woking [please see below])
- The provision of orbital or tangential routes serving outer London suburbs, town centres and locations beyond, on the model of Croydon Tramlink, and the provision of railway lines to improve connectivity (e.g. the Croydon link)
- The transfer of funding from increases in road capacity to public transport and traffic management, including the improvement of environmental conditions in neighbourhoods through the rigorous enforcement of (low) speed limits and restrictions on obstructive pavement parking etc.
- Crossrail 2 regional scheme and bringing forward radial line improvements such as reinstating four tracks in the Lea Valley and additional tracks on the SW Main Line.
- The safeguarding of land in rail corridors for improvement (e.g. if true, the reduction of the rail formation under Earl's Court on redevelopment to two tracks is incredibly short-sighted, given the likely capacity pressures on the West London route).
- Cross River provision downstream of Docklands to link **rail** services for passengers and freight north and south of the Thames (rather than the current preoccupation with road traffic crossings).
- Planning for a direct through link from HS1 to HS2, so that Old Oak and Stratford can play a fuller part in distributing national London-bound traffic, and direct Continental services can be provided from Birmingham and Manchester without stopping in London – both relieving Euston and bringing the "Northern powerhouse" to reality, rather than just adding to Central London congestion.

I also advocate in particular an orbital link for West / South West London which I have put forward in the SW Route Utilisation Strategy consultation – please see the **Appendix** to this note, which considers some of the wider issues related to the M25 corridor in this sector.

What might their potential impact be on employment, productivity and housing supply in London and the southeast?

Although the Commission is not including Airports in the request for comments, it has to be faced that a wrong decision here would make infrastructure provision well-nigh impossible. In particular, the huge housing demands from increased economic activity that a third runway at Heathrow would require would be unsolvable. The public's resistance to the development that would be needed on the green belt and beyond (including AONBs) and the near-certainty that air quality considerations would mean lengthy legal challenges would result in a collapse of planning in west London and beyond and affect London's performance as a whole. (It must be recognised that the Heathrow T5 Inquiry was unequivocal that T5 should be the last major airport development there).

Conversely, the early use of land currently blighted by proposals for the third runway for housing and integrated transport (building on present routes like Crossrail 1) could go a long way to make an impression on the SE's current long-term housing supply deficit, and safeguard areas beyond Greater London from over-development likely to be unsupported by infrastructure which is currently fairly poor.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Better integration with regional rail routes, e.g. Lea Valley / Stansted and SW Main and Suburban routes, to reduce congestion at London termini and provide more journey possibilities, plus widening as suggested above.

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

- What is an appropriate local and regional contribution - given the potential distribution of benefits to business, residents, transport users and the wider economy - and how could this be achieved?
- What innovative funding mechanisms could be considered to support delivery of key schemes?
-

From the land development of the first Metropolitan Railway, through the development of the New Towns, to the proposals for infrastructure financing worked out for example in the Cambridge Growth Corridor in the late 1990s, many proposals have been made for how development might be financed, mostly involving the capture of future land value benefits to assist current development. Proposals along these lines have been made by many of the professional Land and Planning bodies, who can be expected to be presenting them to you. The obstacles seem to be more "political" philosophy than practicality!

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

I do not have direct information on these issues.

londonevidence@Infrastructure-Commission.gsi.gov.uk

Appendix:

The following response to the Wessex Route Study Consultation, made in February 2014, considers the application of some of the issues raised in the Commission's questions, and makes a specific proposal for an orbital rail route to improve infrastructure in the SW and W London and the M25 Corridor.

1. This is an individual response by a resident of Woking. I have a particular interest in the consultation as I am a retired town planner who has had direct responsibility over the years for, *inter alia*:

- Strategic planning, environmental and planning appraisal techniques for large infrastructure projects and sub-regional plans
- The interrelationship between transport and land use, including the geographic and time – accessibility of different modes of transport
- Specific policy issues relating to the needs of industry, the roads programme and rail freight (including at one time re-writing the Freight Facilities Scheme Manual)
- Working (successfully) to bring forward the proposals for South Hampshire electrification by identifying socio-economic benefits, so that the scheme was implemented earlier than originally proposed by the then railway authorities
- Regional planning – including RPG3 (London) and RPG9 (for the wider South East). This included ensuring that strategic reference was made in RPG3 to Crossrail and Chelsea-Hackney (when transport colleagues in government were advocating dropping both!)
- Housing demand and supply in these regions and subsequently the national growth area proposals
- The 700 conditions attached to the Heathrow Terminal 5 decision (as part of the T5 decision team).

2. I am not a railway industry expert, so please forgive any misuse of railway terminology in this response (I have however been a close follower of modern railway matters for over 50 years, and a regular rail and rapid transit user). However, I would like to record at the outset that the consultation document is admirably clear and readable.

3. This response concentrates on the SW Main Line and the potential for an outer orbital London rail service, for this is where I believe the greatest challenge and opportunities lie. Following general observations on the Study as a whole, I advocate the early implementation of:

- Grade separation and additional platforms at Woking and
- An orbital route from Guildford to west London via Heathrow, mainly on existing tracks or following the M25 – which I have termed “Airtrack plus”

General observations:

4. The Route Study appears to be concentrated on the current problems of congestion and ways to squeeze capacity out of a system running at a level which is less than wholly resilient (giving no room for even minor upsets in service). There is clearly an operational and “political” need to address this, but the danger is that opportunities for growth in rail usage and coverage are ignored. Major

timetable changes, new stock and train lengthening has ameliorated conditions more recently for the outer suburban services, (but often at the expense of frequencies of the inner suburban, as a comparison with published timetables from 50 years ago will show). Nevertheless, as is well recorded in the Study, overcrowding is rife and action is needed beyond mere tinkering even to maintain the status quo amongst a growing population.

5. What the Route Study underplays is the potential for further growth in rail traffic if current constraints on journeys (including journeys that cannot at present be made by efficient public transport) were eliminated. Transport demand modelling – and to some extent the current franchise system – tends to concentrate on existing flows and congestion, and underplays the potential for new journey opportunities. Derived demand approaches completely ignore the established contribution that, for example the “tubes” gave to the development of the London suburbs and the Metropolitan Railway did for “Metroland”. Planners have long known that improvements in accessibility can bring increases in usage. The growth of traffic on the SW main line has been well recorded. Past capacity increases have stimulated growth – the effect of electrification of the Southampton line and resultant reduced journey times was particularly marked in the Twentieth Century and stimulated commuting and development along the corridor.

6. Today there is a welcome recognition of the development opportunities of new transport links – redevelopment around Crossrail stations being an example – but transport planners still tend to belittle attempts to create new markets. An example is the history of the Overground, which, when first mooted (as RingRail) in the mid C20, was rubbished by transport planners as having no demand and by railway operators as completely infeasible. Indeed, transport planners at the time were seriously contemplating using the trackbeds of the supposedly redundant lines for urban motorways [I was involved in assessing the quite devastating impact of these routes]. The work of the new Deputy Mayor and others in the more recent GLA facilitated the development of the Overground, and its attractive services have led to the original concept being overwhelmed by passengers, so that trains and platforms have needed to be lengthened and frequencies improved.

7. A simple example of suppressed demand today is Clapham Junction, where the non-stopping of Main Line trains throughout the peak means (from timetabling and platform constraints) that otherwise entirely feasible journeys to such major traffic attractors as Croydon or Inner West London just cannot be made from main line stations as the interchange is not possible. Here, the issue of current capacity and future opportunities overlap – as dealing with one could unlock the potential and generate increased traffic (and revenue) to a wider range of destinations.

8. I would like to see an immediate Improvement of Clapham Junction. Pending a major rebuild, urgent consideration should be given to the conversion of the current Up Fast line to Fast Reversible, with platform extensions and the relief of severely restricted turnouts to platforms 7 and 9 to enable a reasonable number of peak hour direction main line services to call there (and be overtaken by non-stopping services if necessary). This should take place irrespective of the decision on Crossrail 2 (I support the earliest implementation of the regional scheme and additional tracks west of Wimbledon.)

9. A more difficult, but pressing, issue is the traffic opportunity of outer orbital services, represented (by road) by the M25 corridor, which in my view is an opportunity for rail waiting to be grasped, preferably immediately (please see below).

10. Capacity restrictions also inhibit the construction of new stations, on which the Study is silent. I assume that they have been ignored, from the statement given in section 3.6 *other conditional outputs*. However, there are significant opportunities for enhancement of the connectivity benefits

of rail and of attracting traffic at such locations as Burpham and Park Barn (both in Guildford) and these should be included as an early planning aim. These two, from the point of view of the local areas served, are well overdue. Others should be investigated, for example, Stoughton (Guildford) and Sheerwater (Woking – in tandem with current regeneration proposals).

11. It is understandable that, given the physical restrictions on train movements, train lengthening is the first resort of operators (or more fanciful ideas such as double decker carriages as expressed in section 6.3). However, lengthening is probably reaching its practical limits for suburban services, whilst it should also be remembered that the attractiveness of public transport in suburban areas increases as frequencies increase. (Waiting and Interchange times are “valued” more than in-transit time). A Turn Up and Go service is necessary to be attractive to users, as seen most dramatically on the growth in traffic on the London Overground and some “Metro” services. It is therefore encouraging to see the Study examining the potential for enhancing the services over the day. Southern Electric managers considered 20 minutes to be the maximum waiting time without journey planning using timetables. In today’s faster, more instant, world, a frequency of 15 minutes or less would seem essential for non-rural services.

12. Most of the significant proposals of the Study are over the longer term, yet, as we have seen in the past, rail planning has been bedevilled by delays, prevarication and abandonment. The post war plans for cross-London RER main line tubes following Abercrombie (the Greater London Plan) were never implemented (e.g. main line tube F became a watered down Jubilee Line, the Northern Line New Works including taking over some SW suburban branches were abandoned). Major proposals for two E-W lines in the London Traffic Study were forgotten, and – as I mention above – Crossrail was very nearly abandoned too. It is clear from the Study that the current – welcome – proposals for capacity are quite insufficient to provide a resilient service for just the current passenger forecasts – let alone suppressed demand – and that major capacity increases are required immediately. Comparisons with the provision of infrastructure in other World Cities show London and the SE to be incredibly slow, notwithstanding the fact that where there is a will, infrastructure can be implemented relatively quickly (the DLR and Overground extensions being examples).

Relief of congestion at Woking

13. I believe that the flat junction at Woking largely determines the pattern of rail services on the entire SW Main Line, and it seems highly unlikely that the service through this junction could be improved without major work. As the Study points out, existing services through Woking are already seriously overcrowded. Without commitment to improvement at Woking, the only possibility for the SW Main Line (long distance services) seems to be the diversion of a few of these at Basingstoke to Paddington, building on the freeing of capacity on the GW Main Line by the rebuilding of Reading and the platform space at Paddington freed by Crossrail. Whether this could provide an adequate level of capacity without further major expenditure seems doubtful, and would do nothing for the growth in traffic over the Portsmouth, Alton and Basingstoke Line corridors. The construction of Platform 3 at Woking has been a palliative for terminating services, but entails conflicts with the fast lines and additional congestion on the approach to Woking, as many travellers already experience.

14. Woking is therefore the key to both improved rail services throughout the SW Main Line and the additional services needed to support Surrey and Hampshire. There is an additional opportunity to use this capacity to facilitate an orbital service meeting the unmet demand for access to Heathrow and the West of London (see below). In addition, planned proposals for development in Guildford,

Woking and the Blackwater Valley will add to travel demands. Significant commercial and residential developments are already proposed in the sub-regions, recognised in the Local Plans (emerging or adopted) for the area. It is very doubtful whether this level of growth can be sustained on the basis of road traffic alone without severe environmental and congestion implications, themselves fuelling strong opposition to any proposal for growth.

15. The draft Surrey Rail Strategy set out various proposals for additional rail services using the SW Main Line, but none would appear feasible without increased capacity at Woking (with the exception of a proposed terminating service into Platform 6 from Gatwick).

16. I therefore strongly support the Study's proposals for capacity enhancement at Woking by a flyover and extension of Platform 6 to be a through platform (section 6.1), but would advocate consideration of further enhancements, specifically the provision of, or passive provision for, a second additional through platform. Work on this should start as soon as possible.

17. Although development has encroached on some land that might be used for major improvement – which can be seen as incredibly short-sighted by both the past rail authorities and the planning authority – the potential still exists, helped by the fact that the Victoria Way bridge is multi-tracked, and there are abundant railway lands around the station area. It seems perfectly feasible for two new platforms to be located on the southern side of the station on the the up side, continuing the existing Platform 6 track and adjoining siding. In order to reduce impact on the Centrium residential complex, the platforms would begin at about the site of the present booking hall, but would extend over railway lands in the London Direction. (If necessary, appropriate screening of these approach tracks could take the form of a “green roof”.) There may be issues on the historic façade of the booking hall, but this could probably be rebuilt and incorporated in any new development. There is considerable potential for development over the station.

18. Proposals already exist in principle for a new development at the station to provide a bus interchange. Woking Borough Council has an entrepreneurial approach to development, as seen in the extensive proposals for further development of the town centre, and development of the airspace above the station could contribute significantly to its enhancement. A local advantage of any development could be the replacement of the totally inadequate public subway under the station by a convenient over-deck starting at grade from the existing station forecourt, leading to access to the town centre by escalator or lift and incorporating an over-track concourse (itself facilitating retail opportunities for the railway).

A proposal for an orbital railway for Outer West London –“Airtrack Plus”

19. The study refers in passing to the Southern Rail access to Heathrow (section 2.1.5), but in my view misses the much greater case for an orbital rail service, based mainly on existing tracks to link major traffic generators throughout the SW and W London sectors. At present, it is almost impossible to move around Outer SW and W London without going by private road vehicle. There is constant pressure to widen the M25, and the issue of air pollution (see below) is additional to the carbon contribution of road traffic, which is significant in contributing to climate change. The almost total dependency on roads also has considerable repercussions for the structure of the Western and South Western approaches to London, with spreading congestion adding to business costs and sprawl inhibiting efficient and sustainable land use patterns. This is not just a Heathrow issue, but one that affects all the major traffic generators and town centres in the sub-regions.

20. There may be a procedural difficulty, in that consideration of an orbital service is wider than the remit of the SW Trains Alliance, and falls into the category of cross boundary services (chapter 4), which clearly do not exist in this corridor at present. However, improved rail access to Heathrow and beyond is long overdue, and should be seen as a component of a transport strategy to facilitate orbital movements by integrated public transport - movements which can only at present be made by private road transport (with the exception of the rail air coaches which provide a minimal premium service to small numbers of passengers between the airport and selected stations). Moreover, the key to such a service is capacity at Woking and around Staines – both SW Trains’ territory.

21. In addition to the geographical attractions of giving access to major traffic generators – which is recognised in in the Study as “conditioned outputs” to existing stations but not potential new services – there is the issue of externalities and benefits, which do not seem to have been explicitly considered. There is a very strong case for including in any work on rail service assessment the many environmental benefits delivered by electric railway – from less polluting power supply to lower land take than other forms of transport. The main motorway corridors are significant contributors to poor air quality in outer SW London. There are dangers in underplaying the polluting effects of transport, and not just in respect of breaching European Directives designed to minimise the harm to the health of the population. The Environmental Audit report (HC212) in its recent overall conclusion, states:

Urgent change is needed in transport and planning policy to save lives and ensure that the UK meets European safety targets much sooner than the expected dates indicated by Defra. Air pollution is an invisible killer and a public health imperative. A fresh approach is needed for the health challenge we face, coordinating action by local authorities and communities as well as the Government.

An effective orbital rail service taking traffic from the M25 in particular would go a long way to mitigate the adverse effects of unrestrained road traffic in this sector of the South East.

22. Air quality is of particular concern in the area around Heathrow. It is not generally known that Heathrow T5 only just received planning permission. Senior officers of the government departments concerned considered that there was a very high risk of successful legal challenge from opponents, because of the effects of the environmental impacts of the terminal and its associated infrastructure. In particular, the combination of aircraft and road traffic had a wholly unacceptable result on air quality. This was resolved in the ministerial approval by the requirement in the planning conditions of an air quality management plan. It was also envisaged that some of the pollution from road vehicles would be mitigated by the transfer of trips to rail. In addition to the requirement to extend the Heathrow Express and Piccadilly Lines, specific provision was given in the conditions for a provision in the T5 station box for rail access to the west / south west, where the current modal split was particularly poor. In the event, the rail access was not constructed and air quality remains appalling in the M25 and M4 corridors. (The relevant files were declassified on the publication of the T5 decision and should have been kept as a historical record of the longest inquiry.)

23. Over the years, various proposals have been made and abandoned for rail access to Heathrow. SWELTRAC, Airtrack, the Western Connection and others have been made. These proposals have been seen as a means to serving the airport alone, not for more general travel, so they had limited objectives and potential. Airtrack in particular was conceived as a small addition to the existing infrastructure, with links to Guildford and Staines. It was not surprisingly abandoned in the light of the opposition of local interests in Egham and Staines objecting to more frequent closures of level

crossings, and the limited scope for services - curvature of the track at Staines and Virginia Water, the inherent limited track capacity of the Windsor lines through the junctions, and the almost complete lack of capacity at Woking meant that it would never have been a sufficiently attractive service, especially at commuter rush hours. However, the need has been recognised for years, and is there now, not in some far flung control period future.

24. A revived, but extended “Airtrack Plus” route as part of national railways (not an airport concession), serving destinations both south and north of the airport would have two benefits:

- It would mitigate the pollution caused by the road traffic emanating from Heathrow in the short term, as well as providing an alternative to road traffic over a much larger area (including the opportunities for easy interchange to the main rail radial lines)
- It would provide a resilient solution to movement around the West and South West of London in the medium to long term. Whether or not Heathrow was extended, it would provide rapid and frequent services across a wide catchment to HS2 at Old Oak Common (and then proposed development area around it), as well as facilitating future urban development over the Heathrow site (or land to the north of Heathrow) were Heathrow to be wound down.

In addition, if Crossrail 2 goes ahead, and / or Waterloo and its approaches are remodelled, relief will be needed during the period of construction to the South West Main Line, which could be provided by services via “Airtrack plus” to inner West London and, if necessary, Paddington.

25. Whether or not Heathrow expands, there will be significant demand in the M25 corridor for access from the west and south west for the foreseeable future. Even if the Airports Commission does not recommend an additional runway at Heathrow, the existing airport will continue to be busy for years, and modal split from the west and south west is already very poor – a high quality rail service would be attractive. On the chance that (as the London Mayor and some strategic planners such as the TCPA have suggested) Heathrow is wound down in the longer term and replaced by a new town, the significant housing and commercial development would provide many traffic opportunities for rail in all directions – not just to central London (as at present). The background “planning parameters” for an orbital railway are therefore very robust.

26. I therefore propose a semi-fast orbital rail service from Guildford via Woking to Watford Junction and Brent Cross (and other destinations) as suggested in the annex below. The proposal is compatible with possible through running of Crossrail to Staines or any SW Trains Southern Airport access arrangement, as well as any possible Crossrail branch to the London Midland lines through Watford Junction. It would replace the less reliable Rail Air connections by coach. Clearly, some of the existing rail infrastructure is inadequate, but with comparatively modest improvements as noted below (especially in comparison with other major rail and road schemes) many benefits would be unlocked. Capacity improvements are in any event either in train or necessary on existing radial lines that would mean that the incidence of costs would be shared and not wholly attributable to “Airtrack Plus”. The extensive opportunities for interchange with local and main line rail, Underground and Overground, coaches and local buses, would enable very many journeys to be made that are not feasible at the moment, as well as giving opportunities for rail access from other destinations to main centres and traffic generators, many of which are now only accessible by road in the orbital corridor.

Annex: A proposal for an orbital railway

The Core Service for planning purposes would be 4 semi-fast trains per hour over the central section (Woking to Acton Wells/Old Oak Common). Much of the route already exists, but construction is needed at the main junctions and a section by-passing Staines. Additional local services would be provided from the interchanges (many of these local services already exist as part of radial services).

The core route would involve a semi-fast service calling at the following stations:

Guildford: Interchange with Portsmouth, Redhill – Gatwick lines and Blackwater Valley local services. Major town centre, hospital and university town.

Woking: Interchange with SW main lines to Salisbury and Southampton and outer suburban services. Major town centre.

Chertsey: Interchange with Weybridge – Staines services. Major hospital nearby could be served by short bus shuttle.

Heathrow T5: Interchange with proposed Heathrow – Reading service and possible “AirtrackLite”/Crossrail extension to Staines. International Airport.

Heathrow Central: Interchange with Piccadilly Line.

Hayes and Harlington: Interchange with Crossrail and Thames Valley services. Crossrail regeneration potential.

Ealing Broadway: Interchange with Crossrail, Central and District Lines. Major town centre.

Old Oak Common (Acton Wells): Interchange with HS2, Crossrail, Thames Valley and Great Western Main Line, potentially also Overground. Significant future national transport interchange and redevelopment area.

The core service would then split into routes to:

Wembley Central: Interchange with London Overground, Bakerloo Line and potentially London Midland local services (again possibly Crossrail in future). Town centre and international sporting facilities nearby.

Harrow and Wealdstone: Interchange with London Overground, Bakerloo Line and London Midland local services / Crossrail

Watford Junction: Interchange with West Coast Main Line, Metropolitan Line (committed diversion), London Midland and London Overground. Major town centre.

And [via Dudding Hill line]:

Brent Cross (proposed station): Interchange with Thameslink and potentially East Midland services. Major retail centre and redevelopment area.

Potential extensions of services and options:

Basingstoke – Farnborough – Woking

Gatwick – Redhill – Dorking - Guildford

Brent Cross – Mill Hill Broadway – St Albans – Luton Airport – Luton (Major town and airport)

Watford Junction – Hemel Hempstead – Bletchley – Milton Keynes. (Major town and links with E-W rail corridor)

Main Infrastructure Requirements (apart from possible signalling and pointwork where needed to enhance track capacity and subject to detailed engineering studies):

Guildford – potential additional platform already under consideration

Woking – Flyover and additional through tracks and platforms (as discussed)

Chertsey – Heathrow: A new line following the M25 from the existing M25 rail overbridge to the Heathrow T5 station box. The most sustainable solution would be tracks built on the inside lane of the M25, as the capacity of a railway is far higher than a lane of road, although this might seem, under current policies, outlandish! Politically, construction alongside or under the alignment of the M25 is likely. As tunnelling expertise has advanced, this is probably the easiest solution, as we have seen on the Northolt section of the HS2 proposal, and would be plain tunnel, so would not involve any expensive station construction on route.

Acton Wells: New station with interchange to Old Oak Common, and either connection to Euston AC slow lines NW of Willesden or additional tracks to join DC lines at Wembley Central.

Brent Cross: provision for platforms on existing freight lines (which join slow lines at Silkstream Junction)

London's transport infrastructure: Big Picture Stuff

A personal view

By email only to londonevidence@Infrastructure-Commission.gsi.gov.uk

I am pleased to provide this brief submission to the Commission's call for evidence.

As a Director of Ove Arup and Partners I led the team responsible for persuading the Government to abandon British Rail's proposed alignment for the Channel Tunnel Rail Link, and which subsequently designed and constructed what is now HS1. This has in large part been responsible for the success of the Olympics, the regeneration of Stratford and King's Cross and the transformational effect of the Javelin high speed domestic services.

As a Director of Heathrow Hub Ltd and Runway Innovations Ltd, the companies responsible for promoting the extended runway at Heathrow, one of three viable options shortlisted by the Airports Commission and now under consideration by Government, I believe there is a compelling case for a similarly integrated approach to airport expansion and surface access. For me, this is a critical element in the Commission's consideration of strategic options for future investment in large scale transport infrastructure improvements in London.

I understand the political challenges but believe the omission of HS2 and airport capacity from the Commission's consideration is unfortunate to say the least.

For example our privately promoted integrated proposals allow;

- phased delivery of additional airport expansion aligned with demand, air quality and noise targets and surface access capacity,
- lower capital cost allowing all necessary and airport related surface access infrastructure enhancements to be privately funded,
- Crossrail Express services to relieve capacity constrained Great Western Main Line long distance services, increasing commuter capacity in the western corridor and maximising Crossrail's operational efficiency to the west of London,
- New cross-regional through rail services between Basingstoke, Guildford, Woking and Paddington, (via Heathrow), relieving capacity constrained South West Main Line services and congested LUL services from Waterloo and providing passengers from the South West with a direct connection to Crossrail.
- Extending Piccadilly Line services to connect to the Great Western Main Line and Crossrail at Heathrow Hub

This integrated approach is capital effective and revenue positive, providing benefits to both airport and non-airport passengers. It also provides the significant impacts on air quality and carbon emissions that is secured by modal shift from car to rail, not only in the event Heathrow is expanded but also as it continues to grow incrementally as a result of increasingly large aircraft and load factors

In contrast, current plans require significant public monies to deliver sub-optimal results. HS2 intends to fund a replacement depot for Heathrow Express, maintaining this premium service which uses 20% of Great Western Main Line capacity whilst achieving maximum load factor of 30% in the three hour am peak.

The proposed Western Rail Access to Heathrow scheme will, on the Airports Commission's analysis, achieve even lower load factors and will require continual revenue support whilst occupying increasingly scarce and valuable line capacity.

My plea is twofold. Firstly that the Commission brings creative thinking to explore potentially viable strategic options for future private investment in large scale transport improvements in the west of London which would make significant contributions to both the capital and the wider SE region. Secondly that specific attention be given to developing a scenario for sorting out the apparent problems and issues at Euston and Old Oak Common by seriously considering the benefits of the innovative Cross City Connect proposals developed by BuroHappold for a new rail tunnel linking west London with HS1 via a new underground South Bank Central Station between Waterloo and Southwark, with a potential future station in the Barking area before connecting with HS1 north of Ebbsfleet.

Integrated strategic leadership in all these issues is what many of us hope will emerge from the Commission's work! Obviously I would be happy to discuss this further with the Commission.

[contact redacted]

The views expressed by me in this very brief submission are personal and do not necessarily reflect the position of either Heathrow Hub Ltd or Runway Innovations Ltd

Dear Sirs,

As a professional in the transport and planning field, and an occasional user of the London transport infrastructure (mainly as a cyclist - its the fastest mode inside zones 1 and 2, and beyond), I write to offer comment on the call for evidence in respect of the London Transport infrastructure.

I think there are really only two issues in respect of London's transport infrastructure; the level of subsidy it attracts, and the level of provision. Both, in my view, are so disproportionate as to make the provision to all other parts of the UK, and especially the North of England (which for no obvious - or outstanding - reason has been singled out as lacking transport infrastructure), look pitiful. In fact, this is a misnomer. Transport infrastructure provision in the UK is simply being directed in several wrong directions at once. The actual level of infrastructure provision in London is significantly better than the rest of the UK, but its performance - ability to deliver - is almost equally abysmal as in any other major city. The reason is also the same; concentration of resources on the lowest modal utilisation (the car and conventional rail). These two prevent, in the case of the car, efficient use of the highway and goods delivery by the commercial vehicle, and in the case of conventional rail, restrict capacity, and the provision of that capacity, to perhaps 10% of the potential by the use of outmoded and very expensive technology.

In short, London does not have a problem caused by a lack of infrastructure, but a problem caused by lack of effective infrastructure utilisation. That is simply down to poor management, and since government has run UK transport, de facto since 1914, then it is a racing certainty that those - the great and the good of this evidence process - are at least partially culpable in that failure to manage the London land transport infrastructure so that it can deliver what London needs - fast, cheap, low carbon efficient transport for goods and people.

So investment in more of the same is not going to change anything; in fact doing more of the same de facto prevents change. Only doing something different will make a difference.

London needs to lead the world, not follow it. And it can do so easily on the simple level of planning to cope with the cycling revolution now in full flow in the capital; full provision as if the bicycle was the prime user of the highway, with junctions, priority, parking, recharge stations for assisted cycles, all designed to the exclusion - if required - of everything else. Think of it as we did for the motor car 1960 to 1990. Predict and Provide. Stop regarding cyclists as cads on castors (though a few undoubtedly are!) London's shape, as a structural basin, makes the ride to work downhill, on average, with the sweat reserved for the journey home. Makes Paris look hard work, which it is.

The bicycle on its own will do a lot for London, but it will not do everything, though the cost, less than a single rebuild of a mainline terminus, is eminently affordable. It will however, if properly designed, raise zone 1 and 2 transit speeds (door to door) for people from 3-4mph to about 12mph. Outside this central zone cycling will do more than any other modal shift to assist people and goods flows, but it will not address the medium and long distance people and goods flows on which the capital depends, and on which so much is proposed to be spent in addition to what has already been poured down the black holes of Crossrail, HS1, HS2, Crossrail 2 etc.

No current technology will square this circle, but something new will. Second Generation Rail (2GR). You won't have heard of it. It has nothing to do with rail, except the steel of the vehicle tyres and the material of the metal those tyres run on. It offers a solution to the issue of capacity - perhaps 10-fold over conventional rail - at perhaps 10% of the cost, and can be used on the public highway, or on reserved or segregated tracks with full door to door operability. It is equally amenable to freight or passenger, and requires no modal interchanges or special provisions such as large termini;

calculations suggest large termini would be inadvisable due to 2GR's theoretical capacity, even were they desirable. Over medium distances, say up to 120 miles, 2GR would be faster than the TGV and use perhaps 1% of the energy to do the same task. Based upon road vehicle technology, which has driven the western world's mass production for twelve decades, 2GR is only new in the way it looks at the issues of land transport, and the way steel wheels will run on rails; all the rest we already have in the technology drawer.

So London can choose; more of the same at enormous cost, or something new that will deliver what everyone wants at a price that all in the UK, not just London, can afford and acquire.

Yours Sincerely,

[redacted]

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

Unaffordable housing for all except Superrich Need 200+k/y to move to London

Jobs too centralised in Central London

Keeping London the most attractive city to live in the world (critical to maintain advantage as most businesses are based on low taxes and attractive for CEOs and company owners to live and school children

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

- How should they be prioritised, taking account of their response to London's strategic transport challenges, including their impact on capacity, reliability, journey times and connectivity to jobs?
- What might their potential impact be on employment, productivity and housing supply in London and the southeast?

Transport projects should connect new areas of development to new areas for housing so companies employees can choose a house where transport will be connecting to airports/or central connectors

Crossrail 1 and 2 mostly connect existing houses to existing offices, hence it will take a long time for those living to change their existing commuter routes to new jobs etc.

New centres of development at the edge of London or beyond should be planned to become hbs for certain business sectors options are Stratford/Croydon/Luton/Maidenhead Based on that choice transport should be build to areas for future housing
Trains/underground connected to airport/town centre should supplement this development.

Example: IjBurg development in Amsterdam: Bus (later) tramline was running to centre Amsterdam as soon as the first houses were completed, so everyone could plan their commute using public transport

Aix en Provence TGV station was planned in the middle of nowhere which is now a centre of new businesses between Marseille Airport and TGV Station Aix En Provence.

3. What opportunities are there to increase the benefits and reduce the costs of the proposed Crossrail 2 scheme?

Build where new business areas and housing will be instead of in existing housing and business districts. The change of jobs will result in public transport being used in both directions and unload existing routes (instead of empty trains going out of London in the morning)

4. What are the options for the funding, financing and delivery of large-scale transport infrastructure improvements in London, including Crossrail 2?

-
- What innovative funding mechanisms could be considered to support delivery of key schemes? **See Q5**

5. How have major metropolitan areas in other countries responded to similar challenges and priorities? Are there any lessons to be learned and applied in London?

Voorburg Netherlands constructed a road in a ground level tunnel (Sijtwende Tunnel N14) reducing noise, and making land available on top and next to the road for development largely paying for the tunnel. Imagine putting A3 in London into a tunnel with a train/tube line and selling the land above and right next to the tunnel for offices, cycle lanes, other public buildings etc.

I welcome the opportunity to respond to the National Infrastructure Commission.

[contact redacted]

London's transport infrastructure

=====

London has been fortunate to have had significant investment in public transport infrastructure over the past decade. However, as a world city growing at a very fast rate, transport infrastructure remains "behind the growth curve". A key part of the commission's work must be to build consensus on transport infrastructure to avoid rejection of bills in Parliament, as the original Crossrail bill suffered in 1994.

The delay caused by the 1994 rejection set back both Crossrail 1 and Crossrail 2. The result is that Crossrail 2 is effectively solving yesterday's problems, not preparing the city for the challenges of the future. However the worst part is that Crossrail 2 is being proposed with no view as to what large-scale schemes will be needed afterwards. This is a critical flaw that must be rectified.

Question 1

=====

1. What are the major economic and social challenges facing London and its commuter hinterland over the next two to three decades?

The economy of London has become increasingly centralised, placing rapidly increasing demand on rail-based commuter services. The rise in housing costs in Central London only exacerbates the problem, with increasing numbers of people seeking to travel in from homes in zone 4 and beyond.

Two major schemes will alleviate this in 2018/2019 - Crossrail 1 and Thameslink. However, there is currently a gap of over 10 years to the opening of the next potential major schemes in 2030/2031 - Crossrail 2 and the Bakerloo Line Extension. It is entirely right to fear what 10 years of growth could do to the quality of commutes and safety of services. Ultimately, there must come a point at which bright, motivated people look elsewhere for a better standard of living. The danger is that 10 year gap between major scheme openings may simply be too long.

To put this in perspective, rail growth of 4% year on year results in a doubling of passengers in just 18 years. Since the opening of Crossrail 2 is 15 years away, it can be seen that the existing services in South West London may need to handle growth of 80% or more. It can be argued that this is simply not feasible, even if every seat is removed from trains.

Given the potential harm of relentless growth, the commission should consider whether London needs one or more tactical interventions targeted to open around 2025. One possibility might be express, no-station, tunnels for fast lines, which could be developed quickly as the lack of stations creates fewer planning or construction issues.

Another possibility might be tram systems for areas in zones 1 and 2 such as Hackney to Camberwell, again because tram schemes do not have tunnelling and can be progressed quickly.

It must be noted that the Network Rail long term planning process continues to highlight very high growth in demand on services beyond Greater London. It is already common to see standing for 60

minutes from places such as Winchester. Given the long distance rail infrastructure is at maximum capacity along the SWML (South West Main Line) and GEML (Great Eastern Main Line), there is real risk to economic growth.

(Maximum rail capacity on a two track line should be defined as 24tph (trains per hour) where each train is 12 carriages. While minor variations on this may exist, these maximums have been relatively constant for many years.)

Question 2

=====

2. What are the strategic options for future investment in large-scale transport infrastructure improvements in London - on road, rail and underground - including, but not limited to Crossrail 2?

London does not have a vision for large-scale investments beyond 2030.

The impact of this on decision today is explored in the answer to question 3. In this answer, I will outline three potential strategic investments that could be considered.

Extending the Metropolitan and Crossrail 1 in South East London

The Metropolitan line terminates at Aldgate in the City of London.

This is a waste and a classic example of how areas south of the river miss out on metro services.

For the past few years, there has been a proposal to demolish and redevelop the site just south of Aldgate station. In my opinion, TfL should be taking advantage of this unique opportunity to prepare for an extension of the Metropolitan line to Abbey Wood.

The proposal would close the existing Aldgate station, taking the line down and under the District line to a new Aldgate South station on the site mentioned above. A new four platform station would be built, with two Metropolitan line platforms beneath two District line platforms.

The Circle line would cease to run from Tower Hill to Liverpool Street, and the Hammersmith & City line would cease to run from Liverpool Street to Aldgate East. (This greatly simplifies one of the most complex metro junctions in London.)

From the new Aldgate South station, the potential would then exist to extend the line south. My preferred route is to City Hall (London Bridge), Bermondsey, Surrey Quays before surfacing and taking over the existing line through Deptford, Greenwich, Woolwich and Abbey Wood.

Bermondsey would be built as a cross-platform interchange with the Jubilee line, thus passengers from the Greenwich area wanting the West End would have an easy change.

This proposal is intended to be completed in association with a Crossrail 1 extension to Dartford. Rather than needing to build two additional tracks, the Crossrail 1 trains would use the existing tracks to Dartford. Passengers using the current Dartford to Greenwich through service would instead use the high frequency Crossrail 1 service to Abbey Wood and change to the high frequency Metropolitan line service to Greenwich.

It must be emphasised however that this proposal depends on securing and safeguarding the development site south of Aldgate.

Additional Crossrail-style schemes

The primary mechanism to provide the necessary capacity is likely to be Crossrail-style schemes. To meet the growth curve, London needs to be targeting a major opening every 8 to 10 years, something that is considerably more aggressive than achieved to date.

Looking at the areas of London that could be served and could accommodate growth, there is probably a role for at least two more Crossrail schemes. Due to history, there are many more suburban lines south of the river. As such, logic dictates that at least one future Crossrail line will need to run from south of the river to Central London and back to south of the river. The main corridors left to be served would be:

- west towards Putney, Richmond, Roehampton, Hounslow
- south, towards Streatham, Sutton, Crystal Palace, Croydon
- south-east, towards Lewisham, Dartford, Orpington
- east, along the Thames

The most logical grouping would thus be west to south-east and south to east. (Note that areas in the North of London are already well served by the tube, with areas in the north-east served by Crossrails

1 and 2, and areas in the west served by Crossrail 1. The main target for a Crossrail scheme in north London would probably be the Metropolitan line, which might be added to the list of possible corridors.)

Crossrail 1 included some provision for Crossrail 2 in the design of Tottenham Court Road. Without the wider vision for London beyond 2030, it is likely that opportunities will be missed and mistakes made in developing Crossrail 2.

For example, looking at the outline of schemes above, it should be clear that at least one additional Crossrail will run via Clapham Junction (either the west or south corridors). Given this, it is absolutely vital that Crossrail 2 is built with at least passive provision for a four platform station with cross platform interchange at Clapham Junction.

Furthermore, it should be clear that at least one new line will need to run along the Charing Cross - Blackfriars - Cannon Street corridor, and as such this alignment should be safeguarded.

Eastern long-distance express line

At some point soon, the Brighton Main Line will be full. The Great Eastern Main Line will also be full. One possibility is to link them in a true large-scale project.
